VOLUME XXVI—No. 1.

NEW-YORK, JANUARY, 1867.

NEW SERIES—No. 240.

[COPYRIGHT SECURED.]

GROUP OF KINGFISHERS—ALCYONES. — Engraved for the American Agriculturist.

We have had several of the most beautiful of the Kingfishers engraved for our frontispiece this month, not to remind our readers of the "haleyon days" when they went a-fishing and made the acquaintance of the brave little fellow who seems here to be entertaining a party of cousins, but simply to introduce this family to our readers. The Kingfishers are peculiar birds, distinguished by their short bodies, short legs, short rounded wings, large heads and bills. The central one above is our own Kingfisher, (*Alcedo alcyon*), with its bright eye and cocked

hat, and true Union-blue coat. It builds its nests in holes in banks near streams; lives upon fish which it takes from a poise in the air above the water. Its sharp, loud call, quick, arrow-like flight, brilliant manoeuvres, and quick, sure plunges after its finney prey, are familiar to every country-bred American. Beneath, in the picture, flying from us, is the brilliantly colored European Kingfisher—a bird of great beauty. The upper part of the bill is black, the lower orange colored; the throat white; the crest green and blue; shoulders and wings dark

green, with the edges of the feathers pale blue; the back resplendent azure; tail blue, and the whole under part bright orange; legs red, with black claws. It is much smaller than our Kingfisher; and smaller yet, but not more brilliant, is the little East Indian one, which is darting across the bottom of the picture. The spotted Kingfisher on the right is also a native of India, where it is called by the natives the "Fish Tiger." It is considerably larger than ours, and is brilliantly, but not gaily colored. The largest is the great African Kingfisher.

Department of Agriculture.—A bill to reorganize this, as under its present head, disgraceful concern, has been before the House of Representatives twice read and ordered printed. It provides that the President shall appoint a new commissioner within 30 days. There are many wise features in the bill, and some that are especially good to correct present abuses, but might not wear well. We are glad Congress is brought to think on this subject, and hope for a good result.

AMERICAN AGRICULTURIST.

NEW-YORK, JANUARY, 1867.

January seems to have been taken as a starting point for the year, because it comes in mid-winter at that time—when, for weeks before and weeks after the first of the month we have little change. The natural end of the year has been past for weeks, nature is asleep, and just now taking her soundest nap. The natural beginning of the year is weeks a-head, when the sun-shine and the mild south wind shall wake the buds and the roots, and rouse the sods to clothe the Earth in verdure again. What better time could we have to stop and take a fresh start. Janus of the fables, after whom the month is named, is said to look forward with one face and backward with another, so we may review with profit the old year, and with diligence and fore-thought prepare for the new.

It would be unpardonable in us not to send with this first number of the New Year our cordial good wishes to all our friends.—In this we not only follow a very pleasant custom, but sincerely speak the wishes of our hearts, that the year may be a prosperous and happy one to every reader of the *Agriculturist*, to our beloved country, and to the world. We shall labor to make the *Agriculturist* more useful, more varied, more interesting, and more beautiful, to make the farmer's calling more profitable and elevating to himself and more attractive to his children, and to make our journal a welcome visitor and safe guide to all who cultivate the earth for pleasure or for profit, or rejoice in its beauties.

Hints about Farm Work.

Beginning the new year "with a conscience void of offence," and his pecuniary affairs in such condition, that he may know exactly what he owes and what is his due, and of the latter what will be paid and what may possibly be lost, the farmer is ready to take hold in earnest of his year's work. He should have, as essential to success,

Definite Plans, not only for 2 months or 6 months a-head, but for every day, and as the evening and the morning made the first and each succeeding day of the creation, so every evening properly begins the next day, as it is the best time to lay plans for work to be done. This makes the man "fore-handed." The work of every week should be planned by the Saturday night before. Winter is evening to the morning which dawns in April and culminates in July.

Buildings.—Desirable alterations and new erections may be discussed and planned, timber and stones hauled when sledding is good, and preparations completed before the frost begins to come out, immediately after which is the best time to dig cellars, etc., and do grading.

Stock of all kinds should now, in the beginning of severe weather, be well fed and groomed. It is really the most critical time, for they now feel the change of feed most, and if not kept up and well cared for, will begin to run down.

Cows.—Good hay is not 'good enough for any body's cows,' if a few roots daily, and a little meal or oil-cake will make the hay go much farther, make the cattle do much better, and make their whole keeping cheaper, notwithstanding the extra work. Do not dry off cows too early, especially young cows. If possible, keep up the flow of milk by extra feeding, etc., until within 6 weeks of calving. Be careful to have no slippery places where a cow may fall on the ice; the injury may induce slinking (abortion), and this is infectious. If a cow with calf shows symptoms of sickness of any kind, remove her at once to another barn, entirely away from her companions, and keep especial watch upon cows that have slunk their calves in previous years. This is a great scourge to farmers in many sections, and every precaution should be taken to avoid it.

Oxen.—See hints in December number. Beef cattle will be greatly benefited by regular carding;

they need it as much as horses, and we doubt not it would be more to the pecuniary profit of the feeder.

Young Stock.—Keep them growing, and give daily exercise and sunning in roomy yards.

Sheep.—If troubled with ticks, lice, or scab, though at this season it will not do, ordinarily, to dip them, the spots most affected may be wet with the dipping solution, (strong tobacco water, made by boiling tobacco stems, mixed with strong country soft-soap). This is best applied by a bottle having a groove cut in the side of the cork with which it is stoppered. Give sheep access to water daily. It is a great mistake to force them to eat snow or go without. Feed roots freely to all, and especially to fattening sheep. Very little grain will be a great benefit, if equally distributed. Handle your sheep and know their condition.

Ventilation.—Stables and cellars need good ventilation. It is better to let in the cold air in blasts than to confine the air in the stables so that the animals breathe it over and over again, loaded with the exhalations of their skins and lungs, and the vapors which rise from their manure both solid and liquid. The health of the stock requires fresh air; economy of feeding is a secondary consideration; requiring warm stables; both may and should be had. In house cellars, especially if damp, the gases from the decay of vegetables, though slight, if not removed by frequent ventilation, may produce miasmatic diseases, typhoid fevers, etc.

Fowls usually roost as high as possible to avoid uncomfortable draughts of air. If indulged in this, they often become asphyxiated and drop dead from their perches, from breathing foul air arising from the fermentation of their droppings, or being suffocated by the carbonic acid gas from the breaths of many fowls, all close to the top of the house, or from both causes. In warm quarters and well fed, they will begin to lay before the close of the month.

Ice.—See article about tools used in gathering ice on page 15. In packing, take care to have the drain clear and covered to prevent the air drawing through; and see that the floor is covered thick with straw, the ice is closely packed, and the chinks filled with snow or ice chips; also that straw or sawdust is packed between the ice and the sides, and that, if possible, the ice is put in when very cold.

Seeds.—Keep seeds in a dry cool place away from rats, and not in tight boxes of either wood or tin. Secure all that you will need, in good time, before the stocks of seedsmen are exhausted, or they have so many orders to fill, that yours will be delayed. For the same reasons look out a-head for

Tools and Machines for spring and summer work. Send for catalogues, study what you want, correspond about strength, durability, adaptation to your particular requirements, and order in time.

Manure.—Keep it piled up compactly, so that fermentation will go on slowly in the mass. If possible, have a tank for liquid manure under the heap, and pump it up over the solid frequently. Manure sheds quickly pay for their cost in the increased value of the manure. See hints on hauling out manure in December number.

Swine confined upon manure under cover, will keep hard at work rooting it over and working it up all winter, and if it is quite strawy, they will not compact it too much, but add much to its value.

Markets.—We venture no predictions in regard to the markets, but state as facts, that our grain crop is not equal to the demand, that much corn will go South, and much to Europe; the wheat will go to Europe also—all that we can spare. Prices are now very remunerative. Hay and all fodder is high. There has been a great rush of beef, mutton and pork to market. Those who can hold on to animals intended for slaughter, will no doubt get well paid. Still, the turns of speculation and the uncertainties of winter and spring travel, involve it with risks, and lead us to hold to our oft repeated advice, sell when a fair price can be obtained.

Wood.—Cut fire-wood, also fencing stuff, such as needs splitting or sawing, if not cut already, as it should have been. Small stuff for fencing, posts, or poles, should be cut when the bark will peel off easily.

Work in the Horticultural Departments.

Writing up these notes for the month, has one pleasant feature, for, dry as they may seem, they allow a little play to the imagination, and we often fancy ourselves as walking in the well kept gardens and orchards of our friends, and talking with them of the things of so much interest to both of us. We do not make up these hints for the professional gardener, for he needs nothing of the kind; but to those to whom gardening is a recreation, and to those who follow it as adding much to their home comforts, we have reason to know they are useful helps. They are intended to "jog the memory" at the right time, and while they are not supposed to be full treatises upon the different branches of gardening, we are gratified to find that but few essentials are omitted. The enthusiastic cultivator, in whatever department, will avail himself of the best recorded experience, and have at least one standard work upon his favorite topic. These notes always, among other things, have the farmers' garden in view, and we aim to interest our agricultural friends in horticultural matters. If we could induce every farmer who reads the *Agriculturist* to grow one kind of fruit or vegetable more than he now has, how great the aggregate increase of comfort that would result. Why should not your home be the pleasantest in all the neighborhood—yours, reader, we mean—your family the most contented, your children the most intelligent and refined? Did you ever think how far a few shade trees go towards converting a house into a home? The comfort and health that grow upon currant bushes and strawberry patches, and what teachers and preachers are rose bushes and garden lilies? It is pleasing to know how welcome we are in so many thousand homes, and to be told, as we often are, that these homes are happier for our coming. The Horticultural Department, in giving its New Year's Greeting to both old and new friends, asks each one of them to acknowledge this salutation by resolving to plant either one new fruit tree or shrub, one new garden vegetable, or one new ornamental flowering plant or shrub.

Orchard and Nursery.

Did you carefully plant an orchard last autumn, and think there is nothing to do but wait for the fruit thereof? If so, in five years from now we shall have letters asking what is the matter with the orchard. The setting of a tree or plant of any kind involves a promise to take care of it. Unless these conditions are accepted, plant no more trees.

Young Trees, from the beginning, need constant supervision. Were the trees properly planted, no stakes will be needed, but if from careless planting or accident, any tree has been thrown out of the perpendicular, straighten it up and tie it to a stake.

Horses or Cattle often do much damage in young plantations, and must be kept out; indeed hogs are the only animals ever to be allowed in the orchard. There are some annoying wild animals.

Rabbits are easily kept off by anything that is distasteful to them. Blood is found to be as efficacious as anything else, and is easily obtained and applied. A small sprinkling only is necessary.

Mice will girdle small trees and shrubs. They work under cover, and all dead weeds and such rubbish must be removed from around the trees. Clasp the trees with a girdle of sheet iron or old tin, will be found to pay where mice are annoying. Tramp down loose snow.

Drains should be opened on the surface, wherever water accumulates upon the surface. In properly drained orchards this ought not to occur.

Insects can now be successfully headed off. The eggs of the Tent-caterpillar seem to be especially arranged with a view to their ready removal. If a swelling is seen near the end of a twig, it should be looked to, as it is likely that there is a deposit of eggs glued in a band around it. These clusters are readily seen while the trees are leafless, and may be removed by the aid of a step-ladder, on trees of moderate size, and on larger ones a pair of shears may be arranged at the end of a pole to work by a

string. Any time and labor required to remove these eggs will be profitably expended.

Cions are to be cut at any time in winter when the trees are not frozen. Be careful to label every parcel. Saw-dust, fresh from the log, is the best possible material for preserving cions. Its amount of moisture is just that required to keep them from drying, and it is not sufficient to cause injury. It is preferable to sand, as the knife is not injured.

Root Graft at any time during winter, and set the grafted roots in boxes of sand or earth. In

Nurseries, the young stock is to be headed back and brought into shape. Never let two limbs start so near together as to form a crotch. Make every preparation for the spring trade, and have all packing material and labels ready for use.

Manure may be carted out while the ground is frozen, and be ready to spread in spring.

Labels on trees received from the nursery are, for safety, bound on tightly. In this time of leisure go over the orchard and see that no strangulation can result from tight wires.

Fruit Garden.

The general remarks about orchard trees apply to *Dwarf Trees* in the garden. Some pear trees may be injured by lodging snow, which, if it remains in the tree, may do mischief. Shake it out. If any

Grape Vines were not pruned in autumn, do it now in mild spells, and do the same with

Currants and Gooseberries.—Keep the bush open and shorten in the new growth. Cuttings may be made of the prunings by dipping the lower ends in mud and setting them in a cool cellar. See that the

Winter Covering of strawberry and other plants is not blown or washed off. If leaves are used, they may require a little soil to be thrown over them.

Kitchen Garden.

The work here is that uninteresting one of preparation. There is actual work to be done, and there is thinking to be done. Are you growing the best and the earliest variety of every kind? Those who grow for market, look to earliness as the first essential, while those who provide only for home use, look for both earliness and good quality. When one tells us that this or that is the best variety, we must know what use he intends to make of it. If there is one fixed fact in gardening, it is, that the crop is in direct proportion to the amount of

Manure, which should now, while the ground is frozen, be hauled to where it is to be used. Fresh manure for hot-beds, and composted manure to apply to the ground, need different treatment. Well decomposed manure may be taken to the spot where it will be needed, and left in small heaps, while that for hot-beds should not be in so small heaps that it will be chilled through, but it should be kept in a state of fermentation. As soon as a heap shows signs of heating, it should be turned over, and each turning will much improve its quality. Plants in

Cold Frames will need attention. If the weather is very cold and the plants are frozen, it is not necessary to remove the snow from the frames, but a light fall of snow, followed by mild weather, must be immediately removed. Give air abundantly; even take off the glass entirely in mild weather, as it is the object to keep the plants as hardy as possible. If fine weather has made it safe to delay the final

Covering of celery and roots in pits, do it now. At the time we write, the middle of December, it seems as if this might be delayed for some time.

Lettuce, where there is a demand for early plants, may be forced in a hot-bed. The bed should be excavated at least 2½ feet deep, and this be filled with fermenting manure. If not already done, make

Straw Mats for covering hot-beds, these or shutters, will be needed on severe nights, later in the season.

Flower Garden and Lawn.

But little can be done here, other than the general care that every careful person will give.

Evergreens must not be allowed to suffer from an

overloading of snow, and there are many close growing deciduous shrubs injured by this. Shake it out before it becomes icy, and shovel it away from the lower branches of trees and shrubs. All

Laying out of beds and walls may be planned, and in a mild season some of the work may be done. Plants that are wintered in

Pits, need air in mild weather. Water only when they seem to actually need it. Keep mice from pits.

Seedling Perennials in their first winter will do all the better for protection, no matter how hardy the old plants may be. A mulch over the bed will prevent the roots from injury. Leaves may be used, or well weathered muck.

Green and Hot-Houses.

It is not well to let any collection reach a temperature much below 40°. Plants cannot, as a general thing, be expected to flower at much below 60°. For stove plants proper, more heat is needed, according to their tropical character.

Bulbs, that were potted last autumn and kept cool, may be brought to the warmer atmosphere of the green-house or dwelling, and will soon flower. Whenever the flower has passed its prime, cut away the stalk, but allow the leaves to grow to ripen the bulb, which may be useful in out-door culture.

Camellias need an even temperature, one rather low with a moist atmosphere. If necessary, thin the buds. Keep the foliage clear by use of syringe.

Cactuses should, generally, have rest and dryness.

Manure Water, made with sheep or other droppings to the color of pale ale, or an amber color, may be used upon roses and other plants just coming into flower. Beware of over-stimulating.

Plants in cold frames, such as

Violets and other half hardy things, need plenty of air when the outside temperature will allow.

Bedding Stock of scarce kinds may be multiplied by starting the stock plants into growth and taking cuttings, which, after they are rooted, will in turn furnish cuttings for later propagation.

Apiary for January.

During winter, the colder the weather, the closer do bees crowd together in the center of the hive. If they could be observed, they would be seen filling most of the cells of the plates of comb in the middle, and forming almost a perfectly solid globe. They eat out all the honey close to them, and the outer ones of course must eat most, to keep up the vital heat, for they are most exposed to cold. Such a mass of bees throw off much moisture in their breath (so to speak), and in cold weather and in ill ventilated hives, this freezes in the top of the comb, and as it thaws and freezes often, shuts off many bees from access to their stores, unless passage ways are provided in the middle through the combs. These should have been made in the autumn. Besides, were no ice present, the bees might be fatally chilled in passing around the outside of the combs. It is therefore sometimes advisable in case of out-standing hives in long protracted severe weather, to remove the light stocks to the bee-house described last month, or to any room that can be darkened and warmed, when, after examining them to know their state, clear out dead bees, etc. If necessary, let them remain long enough to melt the ice, and allow the bees to dry themselves, and get to their stores, which requires only a few hours. Examine hives to see if they have been attacked by mice, and if so, close entrances against them with wire cloth, but not so as to prevent the egress of the bees. Watch hives that are housed against attacks of mice, but do not disturb them; look to the ventilators. If snow covers exposed hives—well; if light snows fall, sweep it away from the entrances and alighting boards, and from close around the hives. The bees fly out somewhat in mild weather, and would be chilled and die did they fall in the snow. Prepare hives, frames, honey boxes and supers for next summer's use. Painting hives should not be deferred until summer, the longer they are painted before needed, the better.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 41 Park Row, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.00 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

Our Excellent Premiums.

EXPLANATION.

In inviting the special attention of all to the list of most valuable premiums, offered in the accompanying table, a word of explanation may be needed by the many thousands of new subscribers who now see this paper for the first time: We employ no agents, traveling or otherwise, to attend to the collection or renewing of subscriptions, or the securing of new subscribers. As a rule, our old subscribers renew without solicitation, and they generally invite some of their neighbors and friends to join them. In this way our circulation is continually increasing. We bespeak the continuance of this good will and favor, and shall spare no effort to make the coming numbers increasingly valuable, and worthy the patronage of every man, woman and child in the entire country.

Still, it is usually convenient and desirable to have some one or more persons at every Post-Office to gather up and forward renewals, and solicit new subscribers, and to those who do this we offer a choice of good articles, of a value proportioned to their cost, and to the number of names sent in. These premium articles are a token or acknowledgment on our part of favors received, to those who act from disinterested motives—though they also afford good pay in most cases for time expended. Hundreds of persons have written us that they have, by using a few evening hours or stormy days, secured without expense just the articles desired. Frequent cases are reported to us where premium canvassers have cleared from \$10 to \$30 a day, by earning the premiums and selling them.

Any person so disposed can make up a premium list—the offers are open to all. It is a pleasant work. Any one who persuades a dozen, or twenty, or more of his neighbors to read about their business, does much to improve and elevate the character of the people, and to bring increased value to his own homestead, and to every other homestead around him.

Our premiums are all *really valuable articles*, such as we can cheerfully recommend to our friends. By wholesale purchases, by advertising arrangements, etc., we are able to supply them as premiums on far better terms than we could sell them, and we thus pay our canvassers much more than we could possibly do in cash. The paper is supplied to subscribers at cost, or even less. The immense circulation gives great value to our advertising columns, to which only reliable parties are admitted, and these can well afford to supply all the funds needed to pay our premiums, and also a satisfactory profit.

It will be seen then, that the premiums, by aiding to increase the circulation, thus enlarge our advertising receipts, and these, in turn, furnish not only the means of paying for further premiums, but also enable us to supply a very valuable paper at less than its real cost, and still receive an ample remuneration for our work.

We invite every reader who lives where no one is already actively engaged in raising a premium club, to take hold in these leisure winter days, and secure such a club. We often receive several different premium clubs from the same Post-Office....The last column in the table shows how many subscribers are required when they are sent at the lowest club price of \$1 a year for 20 or more. The next column shows the number required at the regular price of \$1.50 a year. (See notes following the table.)

Men and Women of various occupations, Farmers, Gardeners, Post-masters, Merchants, Mechanics, Clergymen, Teachers, Soldiers, Boys, Girls, etc., can engage in the work of soliciting subscribers and secure good pay for it, in the excellent and desirable premium articles.

Table of Premiums and Terms,

Every article offered is new and of the very best manufacture. No charge is made for packing or boxing any of the articles in this Premium List. The forty-three Premiums, Nos. 1, 2, 6, and from 29 to 32, and from 40 to 75 inclusive, will each be delivered FREE of all charges, by mail or express, to the Post-Office or express office nearest recipient, to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

We take so much pains to procure only good articles in all cases, that any one securing anything from our premium list, saves the risk usually run of getting poor or indifferent goods, when buying of unknown or irresponsible parties. Every thing we send out as a premium is guaranteed to be the best of its kind and price.

Our premiums are standard articles, and enough can be obtained to supply all calls for premiums for six months. Every canvasser can take abundant time, but

As fast as subscriptions are obtained, send them along, that the subscribers may begin to receive the paper; and when all the names that can be obtained are forwarded, select the premium, and it will be promptly furnished. To save mistakes and keeping accounts, send with each list of names, the exact subscription money (in Post Office money orders, or drafts or checks on N. Y. City, or, if these cannot be had, register money letters.)

Every name designed for a premium list must be so marked WHEN sent in. (We can not count others.)

Old and new subscribers count in premium lists, but a part should be new names, for it is to obtain such that the premiums are in part offered. Papers to Premium clubs need not all go to one Post Office. Of course the extra copy, usually offered to clubs of ten or twenty, will not be furnished when a premium is called for.

Specimen Numbers of the Agriculturist, Cards, and Showbills, as may be needed, will be supplied to Canvassers. These should be used carefully and economically, as each extra copy of the paper, with postage (2c.) which must be prepaid, costs about 12 cents.

For Full Description of the several premiums see October Agriculturist, pages 349 to 352, or apply for a Descriptive List, which will be furnished free and post-paid. We have room here for only the following:

No. 63 to 74—Good Libraries.—These can be selected by the recipients, from any of the books in the list below. The books will be delivered free of cost, by mail or express.

No. 75—General Book Premium.—Any one not desiring the specific Book premiums, 63 to 74, on sending any number of names above 25, may select Books from the list below, to the amount of 10 cents for each subscriber sent at \$1: or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each: or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.

No. 77 (New)—Pocket Lanterns.—This new premium is a very ingenious as well as valuable Yankee invention. It is a complete Lantern, large enough to afford light for walking or other purposes, and yet in less than half a minute it can be folded into a parcel 3 by 4 inches and $\frac{3}{4}$ inch in thickness, or small enough to set into the vest pocket, and yet contain 3 little sperm candles, matches, etc. We have used one for several months, carrying it in the pocket whenever going out at night, ready for use at any moment. It is manufactured by the Merriam Manufacturing Company, (Julius Ives & Co., Agents, 49 Maiden Lane, N. Y. City). The few sold thus far have been retailed at \$1 each (we thought our first one purchased at that price a good investment, but in order to introduce specimen samples generally, the manufacturers enable us to make a special offer of One Dozen of the Lanterns, for a club of 12 subscribers at \$1.50 each. For larger clubs, at the same rate, or a lantern for each member. A dozen pack in a box $3\frac{1}{4}$ by $5\frac{1}{2}$ by $8\frac{1}{2}$ inches, and will go anywhere cheaply by express. It is described in our advertising columns.

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the Agriculturist, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in Our Premiums, Nos. 63 to 75, above.]

AMERICAN AGRICULTURAL ANNUAL for 1867.

(Companion to the Am. Horticultural Annual.)*

This new Annual includes an Almanac and Calendar for each month, a review of events of agricultural interest during the past year, valuable articles from eminent agriculturists, convenient and important tables, etc. It is profusely illustrated with original engravings. Among other articles of especial value are the following:

Country Life and the Farmer's Old Age, by Rev. Wm. Clift.

Tile Draining, by Col. Geo. E. Waring, Jr., C. E., Engineer of the Drainage of the Central Park. A concise yet very explicit and detailed account of the principles of thorough land drainage and the best modes of accomplishing it. Very fully and beautifully illustrated.

The Culture of Wheat in America, by Joseph Harris, exhibiting the science of the best practice.

The Culture of Barley, by the same writer.

Horse Training vs. "Breaking," by Samuel F. Headly. Full of valuable hints. Illustrated.

Cheap and Substantial Fences and Gates, from several writers, with numerous illustrations.

Requirements of a Good Barn, with Plans, by Dr. F. M. Hexamer, discussing the principles of economy and convenience, applicable to large or small barns.

The Profitable Culture of Potatoes, with descriptions and pictures of some of the newer and best varieties, by Wm. S. Carpenter, of Westchester Co., N. Y.

Management of Large Apiaries—A record from the experience of Bidwell Brothers, St. Paul, Minn.

On Fattening Sheep in Winter, by John Johnston, the Veteran Farmer of Seneca Co., N. Y. Full of very valuable practical and instructive hints.

The Culture of Sorghum in the United States, by Wm. Clough, Editor of the Sorgo Journal.

Principles of Fine Wool Sheep Husbandry, by Henry Swift, Esq., of Dutchess County, N. Y.

Raising Poultry on a Large Scale, by Simeon M. Saunders, Author of Domestic Poultry.

Veterinary Medicine and Surgery, by John Busted, M. D., President of the New York College of Veterinary Surgeons.

Recent Progress in the Science of Agriculture, by S. W. Johnson, Professor of Agricultural Chemistry at Yale College.

Agricultural Education and Agricultural Colleges in the United States.

AMERICAN HORTICULTURAL ANNUAL for 1867.

(Companion to the Am. Agricultural Annual.)*

This important new Annual is now ready. Its plan is different from any heretofore published in this country; it aims to be a

RECORD OF HORTICULTURAL PROGRESS, for the year 1866, free from matters not legitimately horticultural.

THE MATERIAL IS ALL NEW, and not a reproduction of old articles that have served their turn elsewhere. The volume is

LIBERALLY ILLUSTRATED, with engravings made especially for the purpose. That a Year Book of Horticulture is needed, is shown by the readiness with which

DISTINGUISHED HORTICULTURISTS have contributed to its pages. Among other contributions from experienced cultivators, there will be

THE APPLES OF 1866, by Doct. John A. Warder, (President of the Ohio State Pomology Society, Author of American Pomology, etc.) New Ohio Apples; New Indiana Varieties; Southern Varieties fruited at the North, etc. Illustrated.

NEW AND NOTEWORTHY PEARS, by P. Barry, author of the Fruit Garden, etc., giving descriptions of new varieties as well as of the less known ones that have been fully tested. Illustrated.

NEW BEDDING AND OTHER PLANTS OF 1866, by Peter Henderson, Florist, etc. An account of the newer varieties of bedding and other flowering plants, and their success and failure during the past year. Illustrated.

THE RARER EVERGREENS THAT HAVE PROVED VALU-

* These valuable Annals are worthy a place in every family. Price 50 cts. each. Sent post-paid for same price.

ABLE, by Thomas Meehan, Editor of Gardener's Monthly, American Hand-book of Ornamental Trees, etc.)

NEW VEGETABLES OF 1866, by Fearing Burr, Jr., author of American Field and Garden Vegetables; and J. J. H. Gregory, Marblehead, Mass.

SMALL FRUITS IN 1866, by Andrew S. Fuller, author of the Grape Cultivator, Forest Tree Cultivator, etc. A valuable summary of all small fruits, excepting grapes.

HOME DECORATIONS, by A. Bridgeman. How to treat Ivy; Hanging Baskets, Rustic Stands, etc.—Illustrated.

NEW ROSES OF 1866, by John Saul, Florist, of Washington, D. C., and well known authority on Roses.

THE CULTIVATION OF HORSERADISH, by Peter Henderson, author of Gardening for Profit. Concise directions for growing this profitable crop.—Illustrated.

GRAPES IN 1866. From notes by Geo. W. Campbell, Delaware, Ohio, and other Grape Growers.

PROPAGATING GRAPES IN THE OPEN AIR, by William Patrick, Terre Haute, Ind., giving a method by which the Delaware and other difficult varieties may be grown—without artificial heat.

USEFUL SEED TABLES, by James Fleming, Seedsman, New York, giving the amount of seed to the acre, to a given length of drill, etc.

Other communications by well known authorities, besides a great amount of Editorial matter, including a Calendar for each month in the year, articles on Wine Grapes, Table Ornamentals, Hedges, Farm Nurseries, Tree Labels, New Gladioluses, List of Engravings of New Fruits and Flowers published in 1866. List of Works on Horticulture for 1866. A DICTIONARY of Horticultural Terms, and a great amount of other matters of interest, both to the professional and amateur gardener.—Price 50 Cents.

Commercial Matters—Market Prices.

Gold has again declined materially, and closes heavily, leading to great caution in business operations, especially in produce and merchandise, and most adversely influencing the market for imported articles. Early in the month under review, breadstuffs were quite depressed in price, influenced by liberal receipts, the fall in gold, and the restricted wants of buyers, both for home use or for export. Toward the close, the receipts fell off; the home and foreign inquiry revived, accompanied by some speculative orders; and prices of the leading articles, particularly of flour, wheat and corn, close with a strong upward tendency. We enter the winter months with comparatively moderate stocks of flour and grain, on which the principal holders are not eager to realize at prevailing rates, as they confidently look for a better market later in the season. The canals of the State were to have been officially closed on the 13th inst. Since that day, the weather has been so cold as to forbid the hope of any further considerable receipts by water. Henceforward, for some months, the railroads will be the main reliance of the trade.... Provisions have been much more freely offered and purchased at materially reduced prices, especially for hog products, which have been arriving in unusually liberal quantities, but the market closes firmly on the basis of our quotations, with a fair trade demand.... Cotton has been moderately inquired for at variable prices, closing tamely and slightly in favor of buyers. Thus far, in the current cotton year, commencing with Sept. 1, the receipts at this port have been 202,000 bales, and at all the shipping ports of the country, 504,000 bales; exports from this port, 82,000 bales, and from all ports, 135,000 bales; estimated stock now here, 150,000 bales, and at all the ports, at latest mail dates, 460,000 bales.... There has been an improved inquiry for wool, chiefly within the past two weeks. Low prices were made early in the month, but the market closes with more firmness and buoyancy. Manufacturers evince more disposition to purchase. Stocks of desirable grades are moderate, and less eagerly pressed for sale.... In tobacco there has been less doing, and prices have been irregular.... In hemp and seeds, business has been light, and prices of both have been nearly nominal.... Hay has been in better supply and less request at lower figures.... Hops have been in fair demand, and quoted a shade higher.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for a month, ending Dec. 15, 1866, and the exports of Breadstuffs from this port thus far, since January 1:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

Total Animals for Slaughter in past 5 Weeks.....	29,104	314	4,614	125,664	87,500

The weekly receipts of all kinds of animals, though less than the previous month, have yet been abundant for all demands.... **Beef Cattle** continued low for a time, but with diminished receipts and cold weather, have advanced a little, and just now (Dec. 22) prices range at 16c. @17c. per lb. estimated dressed weight for the first quality; good fair killing animals, 15c. @15 1/2c.; medium 14c. @14 1/2c.; common to poorest, 13 1/2c. @11 1/2c. Some "Christmas Bullocks," sold at 18c. @21c.... **Milk Cows** are in little demand at \$45 @ \$60 for poorest to common; \$65 @ \$80 for fair to good; \$85 @ \$100 for superior or extra.... **Veal Calves** of superior quality are in demand at 12c. @14c. per lb. live weight; medium to inferior, 13c. @10c.... **Sheep and Lambs** have continued to arrive in large numbers (over 25,000 per week.) and prices have run very low. Present rates for sheep are, 5c. @7c. per lb. live weight for poor to very good. "Christmas Sheep" brought 8c. @10c. Lambs, 7c. @1c. above the same grades of sheep.... **Live Hogs** have come in less freely. The fall in barreled pork has kept prices very low, but they are looking up a little; latest sales, 7 1/2c. @8 1/4c. per lb. live weight.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Mark All Subscriptions sent in as *New*, or *Old*.

To Correspondents.—Just now, when everybody is sending subscription letters, we are receiving many notes of experience, hints, suggestions, inquiries, etc. This is well—nay, very desirable. Let them come without limit. But we must take time to read, digest, and use this mass of material; we only refer to the matter, to excuse any seeming, but not real, inattention.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single number of the past ten years will be supplied, post-paid, for 15 cents each.

Parsons & Co's. Sale of Grapes.—Messrs. Parson & Co., the well known nurserymen of Flushing, N. Y., have for two years held a trade sale of grape vines. They claim that the mere disposal of the vines, was not so much of an object to them, as to ascertain, by putting up a large number of vines at public sale, the state of the market and the estimation in which the different varieties are held. We attended the sale held on the 12th of Dec. last, and were surprised to find a company, not of vine buyers and planters, but one made up almost entirely of vine growers and dealers. People who should have gone to buy vines, stayed away, while those who had vines to sell and had curiosity to see how those of other people sold, attended in considerable numbers. As a consequence, but a small number of vines were sold, and those at low prices.

Of Small Consequence.—The Country Gentleman thinks that the appropriation of the literary property of another is a "matter of small consequence." Is it though? Just wait awhile and see.

The American Dairymen's Association holds its Second Annual meeting at Utica, N. Y., January 9th and 10th. The meetings of the Associated Dairymen, for some years past, have been full of interest and profit to those attending. This flourishing Society was formed last year. Wm. H. Comstock is President, and Gardner B. Weeks, of Utica, Secretary.

Cornell University.—Hon. Andrew D. White, of Syracuse, has been chosen president. He is a graduate of Yale College, for some time filled a professorship in the University of Michigan, and has from its organization been a member of the Executive Committee of the University. It is an excellent appointment.

The N. Y. State Agricultural Society holds its annual meeting in Albany, February 13.

Illinois Horticultural Society.—The annual meeting was held at Champaigne, commencing Dec. 11. We were unable to be present, but have received from one of its prominent members the following summary:

On the present occasion the attendance at opening was larger than usual. The address of welcome was pleasantly offered by Mr. J. O. Cunningham, and was responded to by the President, Parker Earle, Esq., of South Pass, who gave a very agreeable address, filled with valuable suggestions for the guidance of his fellow members.

The reports of the Vice-presidents, from the various Congressional Districts, were then read. Some of these were quite encouraging as to the extent and results of horticultural operations. It was reported that at several points along the line of the Illinois Central Railroad, south of Centralia, there have been planted within a few years: 500,000 Peach Trees; 250,000 Apple Trees; 85,000 Pear Trees; 100 acres of Grape Vines; 325 acres of Strawberries; 75 acres of Raspberries; and that all of these kinds of fruits do well in that region. One gentleman stated that eighteen tons of strawberries had been ship-

ped from a single station in one day, and it was estimated that in a few years, in a favorable season, a daily train of thirty or forty cars would be required for the transportation of the peach crop alone.

The bird question was brought up on the reading of the reports upon this subject, by committees appointed last year. This topic always excites a good deal of animated discussion. Fruit growers who suffer from the depredations of these creatures are becoming very jealous of their intrusion upon the privacy of the garden and orchard, and are hardly willing to acknowledge the services rendered by our feathered friends.

B. D. Walsh, of Rock Island, who ought to be the State Entomologist, delivered a very interesting popular lecture, illustrating the importance of a knowledge of entomology. He was listened to with marked attention.—Strong resolutions were adopted, urging the State Legislatures to act liberally in this matter, to appoint and pay State Entomologists to instruct the people by reports on injurious insects.—The members and all others were urged to sustain the *Practical Entomologist*, which is published in Philadelphia at a low price.—Much time was occupied by reports as to the *Status of Horticulture* in different sections of the State, and in revising the fruit lists.—Among the lectures read, was one by Hon. M. L. Danlop, of Champaigne, who pointed out the great advantages which might be hoped for from the establishment of our great school, supported by the proceeds of the Congressional Land Grant.—The meeting closed with the feeling on the part of all, that the occasion had been one of profit and pleasure to those in attendance.

Mass. Agricultural College.—It is often a good thing that events happen which put a dead lock upon the proceedings of people in power, or those holding important trusts, and force them to stop and think. This has occurred to the Trustees of the Mass. Agricultural College, which body, unwisely from its numbers and slow to act—its members disagreeing among themselves—has finally come to the point of stopping to think. Their president and also the president of the College, Hon. H. F. French, has resigned. Prof. Chadbourne of William's College has been appointed president; a first rate farmer, Levi Stockbridge, of Hadley, has been appointed farm-manager, and things look now as if beginning anew with more moderate ideas, the Institution might gain a healthy growth. A mistake too often made, is in attempting to create a great institution in a short time. Strength, vigor and sound vitality come with a gradual growth—as witness Rome and the Oak.—In the beginnings of our agricultural colleges and similar institutions, the error fallen into, has been in considering a grand building the most important thing. Set a number of earnest men, capable of teaching agriculture, down upon a good farm, with a good large house and barns upon it, and the co-operation of a good farmer; put up a few temporary buildings, if need be, for lecture rooms now, and perhaps for stables by and by; give the faculty a little money to spend upon books, apparatus and fitting up; let them know that they shall have more as fast as they can show results; let all permanent improvements be made with a view to the future; and leave the Faculty as unhampered in regard to matters of instruction and discipline as possible, and success of the most gratifying character will be almost certain in any State of the Union. The grand establishment, with all desirable surroundings, will come in good time, with that practical fitness of things to ends, which comes with gradual healthy growth.

Report of the Commissioner of Agriculture.—The opening of a new session of Congress last month was the occasion of the message from the President and reports from the Departments, and the report of "The Honorable" (what are titles worth?) Isaac Newton, Commissioner of Agriculture, comes also among them. This document has been extensively published by the daily press of the country, and we will here only call attention to the fact, that nothing of any importance has been done, with the exception of collecting and publishing statistics in regard to growing crops and the prospects, the wholesale distribution of seeds, (amounting to 992,000 packages,) and of plants (34,000,) with the reported "interesting and suggestive" operations of the experimental farm, where grains, etc., received from all over the world are tested. These, with the publication of the Annual Report, has cost \$162,600.43, but how much real good is accomplished? Mr. Newton has sent away his best men. The chemist has been kept at work analysing copper, iron and silver ores, testing rhubarb wine and such things (for Mr. Newton's friends). The museum has grown, as it should, under the care of Mr. Glover; the garden improves year by year under Mr. Saunders; the farm is, we presume, in good hands, and the statistical department seems to have careful thought and labor. Mr. Newton has nothing to do with these things, except to make himself a nuisance, and interfere with their better operation, as he has with the able

chemist, Dr. Erni, who, for faithfulness, has lost his position. Mr. Newton has kept his own place, though notoriously inefficient and a disgrace to the country, which has such an illiterate, thick-headed man in so responsible a place, simply by the diligent use of means—fruits to this Senator, flowers to the wife of another, delicacies to the White House, a sinecure clerkship to the lazy cousin of some one of influence, and so on.—Does agricultural education receive a thought from the Commissioner? Do the causes of the diseases which are so destructive to our animals? Hog-cholera has been among us for years, and is as yet uninvestigated; the Spanish fever threatens great damage to the cattle of our Western States; abortion in cows is on the increase at the East, and glanders and farcy are destroying thousands of horses. Why no word about these things? Does he concern himself with agricultural immigration, and the occupation of United States land under the Homestead Act? The instruction of immigrants? The projects of planting trees upon the prairies? The encouragement of emigration southward, to restock and cultivate the Southern States? and many such like things? Not he.—In his concluding sentence, Mr. Newton says, "he cannot repress the conviction that a new era is dawning upon the agriculture of our country."—May his own speedy retirement from office give force to the conviction.

Hog Cholera.—This pest grows worse and worse—its ravages have been the past year greater than ever before within our knowledge. Many a farmer's profits for the year have been swept away by the almost utter loss of his swine just maturing for the butcher. We know of no investigation of the disease by any really scientific veterinarian, and the quacks either disagree or follow the last published opinion. The anxious queries of multitudes of our correspondents, and the reports which burden the press, carry the conviction that something must be done by our General or State Governments to investigate and stay this plague if possible. The Prairie Farmer expresses the belief that the disease prevails in every county in Illinois, and over a large part of Kentucky, and our information is to the same effect.

Wire Fences.—J. Flanagan, Pawnee Co., Nebr. Wire fences answer very well after cattle are used to them, and if they are not inclined to be breachy. A fence with one rail at top and wire below is safer than all wire, although horses will get accustomed to this and jump it, as they will any wooden fence not too high. No animal likes to jump a wire fence, but they will learn to crowd it down. The use of living trees set as posts for wire fences is not new, and it works very well when plenty of ground can be given up to the rows of trees.

Don't Buy those Peach Trees.—"J. L. J., Gallia Co., O., says, a peddler has been along with peach trees huddled on a "Persian Root," asserting that insects will not kill the trees, they will bear fruit every year, and frost will not hurt the bloom. Now one of those good things would be enough for one root, but three such precious qualities is more than one root could have, and be anything less than Persian. Friend J. doubts the statement—as he evidently reads the papers—but he wishes his doubts confirmed. Suppose it were possible for a stock to confer such qualities, would you be likely to first hear of it through a peddler?—If you had such a stock, Mr. J., you could be the richest man in Ohio, and your country's benefactor at the same time. Some things are "too good to be true."

Above-ground Cellars.—"J. A. M., Miami Co., Ind., asks for the experience of the readers of the *Agriculturist* in regard to buildings made with double walls, filled with saw-dust, and used as cellars.—We know that "bomb-proofs" made altogether above ground, by building up with logs and covering the structure with many feet of earth, make excellent cellars, and think a building walled with saw-dust, if thick enough and well roofed, would answer a good purpose. They certainly would if they contained ice houses in one end.

"Northern Coffee."—"J. R., South-wich, Mass. This is just the old Chick Pea, *Cicer arvense*, that in years past we have freely sown up when offered for sale as a new kind of "coffee." It is probable that it is as good as any of the substitutes. We cannot publish the offer of any one to send the seeds of anything free, unless assured that they have seeds by the ton, and a large force with nothing to do but put them up, for in our next issue we should be obliged to inform the public that the stock was long ago exhausted. Such offers are made in a liberal spirit, but it is kindness to refuse to publish them, though it may not seem so. We do not recollect a case, in which our giving such notice did not bring untold vexation to the one making the offer, and disappointment to thousands of unsupplied applicants. Every such offer through the *Agriculturist*, is seen by at least half a million people, and responded to by many thousands at least.

Doctors in Difficulties—Camellias, etc.—If one should write to a physician a hundred miles off "Doctor, I am sick, what shall I do?" he would perhaps get by return mail the advice, "get well."—Now, we get a great many letters that are no more definite than the one supposed above. As a sample: One writes that his *Camellia* is not doing well, is afraid he shall lose it, and asks what he shall do. How is it possible to answer? The only useful advice we can give is to send it to the nearest florist and let him take it in hand. The plant may be overwatered, may have been burned in the sun; it may want re-potting, it may have been injured, as *Camellias* too often are, by over-stimulating with manure; Scale may be all over it; there is no end of troubles the plant might have in the hands of one not used to plants.

Dahlias—Two Colors on One Plant.—J. Broadhurst, M. D., gives an account of a *Dahlia* with a light and dark flower on the same stalk, and asks if it is a common occurrence. We have had it happen a number of times with flowers that have dark petals tipped with a lighter color. Sometimes these colors split up as it were, and we had some flowers all of one, and others all of the other color. Dahlias are so constantly changing that no book, a few years old, would be of much use for varieties. The catalogues of the florists' made up every year, are the best guides as to colors, etc.

Beurré—How Pronounced.—"Que-rist" asks: "Can the *American Agriculturist* tell us how to pronounce the word *beurré*, which forms part of the names of so many varieties of pears, as *Beurré Diel*, *Beurré Superfin*, *Beurré Clairgeau*, etc.? Leading fruit men differ, some calling it *bure*, others *bu-re*, others *bu-ra*, others *bu-rá*, and still others *burr*. One another proposed the question through the N. Y. Evening Post, which deals much in literary topics, but nobody has ventured an answer in that journal, and we must look to the 'authority' on all horticultural and agricultural matter, viz: to the *Agriculturist*, to get the 'question settled.'"—ANSWER: The word *beurré* means Butter-pear, and if one follows the French pronunciation it is *bur-ray*, as near as can be expressed in English spelling. We think, however, that most of our pomologists say *bu-ray*, which is Americanizing the word, and perhaps the next best thing to dropping it altogether. We cannot see why *Clairgeau* is not just as good a name to designate the pear as *Beurré Clairgeau*, and we hope that when our American Pomological Society convenes again this subject of names will have an overhauling. We put our own pronunciation to geographical names, and consider it affectation if one says *Pah-ree* for Paris—why not do the same with fruits.

Late Strawberries.—Several accounts have come to us of strawberries fruiting in autumn, and some sent us specimens. This is nothing new, nor is it at all desirable. A warm autumn will frequently start buds that should have kept quiet until spring, and the next season's crop will be so much the poorer.

Fruit in California.—At the State Fair last year, held at Sacramento, Cal., Mr. J. R. Nickerson, of Lincoln, exhibited 265 varieties of apples, 92 of pears, 30 of peaches, 12 of quinces, 240 of grapes, 5 of figs, 13 of plums, besides blackberries and several other things. Mr. N., we make you our best pomological bow, and encourage you with the assurance that if you keep on thus, you will one day have a very choice collection of fruits.

A String of Flower Queries.—The following letter from a correspondent in Waltham, Mass., illustrates how questions pour in upon us. As this writer's queries are all in one line, the case is not so difficult, but it very often happens that we have as many in as many different departments. When the latter is the case, it rarely happens that more than one gets answered, as our editors live many miles apart: 1. Is there any hardy Evergreen climber suitable for a porch? Do any of the *Viues* answer the demand—if so, which?—2. Why is not the common *Sumach* eligible as an ornamental shrub; yet no nursery has it? It is common—so is *Maple*—has it a further ailment?—3. Do double *Portulacæa* seed, or must I buy more, annually?—4. Is *Callistegia* a desirable plant?—5. Must I say *gladiolus* or *gladiolus*?—6. Will any hardy rose flower in the garden perpetually through the summer?—7. Does any *Lobelia* retain the beauty of *cardinalis*?—8. And any *Aquilegia* the color of the *Canadensis*?—9. Why is not the field lily, *Lilium Philadelphicum*, cultivated in gardens?—10. The seed catalogues give us the excellences, and not the faults of all the flowers.—ANSWERS. (1) Only *Ivy*, which will not be hardy with you.—(2) It is. Nurserymen keep only those things for which there is a demand.—(3) They produce but very little seed.—(4) If you wish a task, just try to get the roots out, after it is once established. The vine and flower are pretty, and if you

wish to grow it, sink a box or keg for the roots.—(5) That depends upon whether you want to use it as a botanical or common name. *Gladiolus* is the former, but popularly *gladiolus* is too well established, to hope to change it. We say *Anémone* and *Anemone*, for the Latin and English of the Wind-flower.—(6) No.—(7) Some have larger flowers, but none more brilliant.—(8) Not precisely.—(9) It is in several that we know of.—(10) Because they are catalogues, and not treatises.

Soap Inquiries.—We have a large batch of letters of inquiry about various soaps, and saponaceous preparations, advertised to "wash without rubbing," "labor-saving soaps," etc. These are nearly all answered in November, by the article on soap in general. Most of the advertised soaps do what is promised for them, but remember that anything that will dissolve out grease and filth quickly without rubbing, will also injure the fibers of the garments. The only safe soap is the common brown, or pale brown, which, on drying, does not contain any whitish or other deposit on the surface. That which shrinks greatly, contains too much water to be economical. The brown soaps, if not very dark, may be used for cotton and linen, but for woolen, use only the light colored or pale bar soap.—See November number, where the subject is fully discussed, except as to fancy soaps, and the like, which are reserved for a future chapter.

Flat or Lap Furrows.—An article in the *Agriculturist* recommending to turn furrows "flat as a floor," has provoked comment both among our subscribers and our exchanges and their correspondents. The subject is one which ought to be discussed. The writer long held to the value of lap-over flat-furrows in fall plowing, for two principal reasons, viz.: that they better drain or dry the land, and that they expose more soil to the weather during winter. In regard to these points we have changed our views, having seen it repeatedly demonstrated that the difference is not very great. Perhaps on tenacious clays on spruiky cold land, essential benefit might be found in lap furrows; on other land not. There are two other considerations, in fact three, which outweigh the above altogether in our mind: 1st, manure is much better covered; 2d, the land is left free from weeds, the sod is perfectly killed out of the way of the harrow, and in the best position to rot quickly and uniformly; 3d, by the action of frost alone, much fall plowed land is prepared for spring sowing of grass or grain. For grass or clover it needs no working over at all. For oats, barley or wheat, all that is necessary, is to harrow or bush in the seed, if sown broadcast, or otherwise, to go right on with the drill, and follow with the roller—this on good, common, loamy soils. We can point to a field plowed two years ago for corn, half with a lap furrow and half with a flat one, where the number of weeds and the labor of suppressing them on the lap furrowed part has been twice, if not three times, as great as on the other. And we can name farmers who once held strongly to the lap-furrows, but are now delighted with the working of their flat-furrow plows. They are not on heavy clays, but we think the principles named equally applicable to clay and sand as to loam, and especially so in spring plowing, to which the objections urged do not apply with the same force as to fall plowing.

Wash the Teeth at Night.—A few who inherit good teeth, and care nothing for "looks," neglect brushing their teeth; but none who study cleanliness and a sweet breath, or who wish to preserve their teeth, good or bad, as long as possible, should neglect to brush them well one or more times a day, with a brush so stiff as to clean them well, but not so hard as to wound and irritate the gums. They should be brushed both night and morning, but if only once, let it be done the last thing before retiring. Portions of food, sweets, etc., left on or between the teeth during the night, decay or acidify, and corrode the enamel, and thus gradually injure them. If the cavities between and in decaying teeth be thoroughly brushed out with water at night, and when rising, it will add years to their effective use and freedom from pain. Most of the tooth powders sold contain an injurious acid, which, though it gives the teeth a clean, white surface, does it at the expense of some of the natural surface. A little hard soap, pleasantly perfumed, is the best possible application. We would not recommend even the finest charcoal, or prepared chalk or clay, for though inert, they wear upon the enamel.

In Polishing or Washing Door Knobs, or other articles projecting from a painted surface, protect the paint by slipping over the articles a piece of stout pasteboard or cloth, having a hole or slit in the center large enough to slip it on.

Have you Plenty of Door Mats? Our observation is, that comparatively few housekeepers appreciate the economy of having plenty of mats at every outside door. The chief wear of carpets comes

from sandy or gritty materials brought in on the hoots or shoes. Ucarpeted floors are constantly soiled from the same source. Most persons keep but a single mat just inside, or outside of the door. It is far better to have two or three—one coarse, heavy one outside the door, at the bottom of the steps, another just against the door on the outside, and another finer one on the inside. Mats so placed will be a strong hint to careless, slovenly men and boys to wipe their feet clean. The cost is not much more for three mats thus used, for they will last nearly three times as long as a single one. Each fifty cents invested in mats will usually save ten times the amount in carpets, and in lessening labor and annoyance. Corn husks braided together make good home-made mats. Pieces of old carpets are far better than nothing. A good, cheap mat can be easily made by stitching two pieces of old carpet together and stuffing with a thin layer of hay or straw, knotting it through to keep the filling in place.

In Boiling Meats, never put them in cold water, but plump them into that which is boiling briskly. This will coagulate the albumen on the outside, close the pores, and prevent the water from soaking out the rich juices. If salted meats need freshening, let it be previously done with cold water, taking all needed time, with frequent changing of the water, if it is very salt.—Tough, cheap pieces of beef, can be made tender and palatable as follows: If salt, freshen as above. Put into the pot with a trifle more water than will be finally needed. Set into the top of the cooking pot a closely fitting tin pail or pan, and fill it with cold water. If this gets boiling hot, dip out some and add cold water from time to time. Boil the meat until it gets so entirely tender that the bones will drop out, even if it takes five or ten hours. The steam and aroma or flavor of the meat, will be condensed on the bottom of the covering pan or pail of water, and drop back, and thus be retained. When thoroughly done, remove the cover, and slowly simmer down thick enough to jelly when cold. Dip out the meat, remove the bones, place it in a pan, pour over it the boiled liquid, lay over it a large plate, or inverted tin platter, and put on 15 to 30 lb. weight. When cold, it will cut into nice slices, and if lean and fat or white meat be mixed, it will be beautifully marbled. The juice will jelly and compact it firmly together, and you will have nice juicy meat, good for breakfast, dinner or supper, and so tender that poor teeth can masticate it. Fresh beef, or corned beef well freshened in cold water, may be used in this way with decided economy, and it is far superior to meat boiled in an open vessel from which the flavor has constantly escaped, as you can perceive by the odor all through the house, if Bridget leaves the kitchen door open a minute or two, as she will certainly happen to do.

Cleaning Tripe.—In October, we referred to tripe as a wholesome, nutritious food, that should be more generally used, and gave some methods of preparing and cooking it. Edw. Partridge, of Waldo County, Me., sends his method of cleaning, which he thinks better than those described: "In removing the stomach, be careful to keep the outside clean. Shake the contents well out through a small hole, and put in a quantity of unsalted lime about the size of a coffee cup, with about 2 gallons of water. Place it in a tub of water and agitate 15 or 20 minutes, or until the lime is well slaked. A slight scraping will then remove the inside skin. The slaking lime takes out all odor, and makes the tripe nice and soft." After cutting up and washing well, it is ready for boiling, and may then be pickled in vinegar, or kept in salt water, to be changed daily and he cooked like soups, or broiled like steak, buttered and peppered; or be dipped in batter and fried.

Mush, or Hasty Pudding.—Salt the water sufficiently, and when boiling, stir into it sifted meal until two-thirds as thick as desired; then for the other third, use coarse wheat flour, and boil a few minutes, stirring all the time.—Mrs. M. W., Agency City, Iowa.—[The secret of making corn meal palatable, whether in puddings of any kind, or in cakes or corn bread, lies in cooking it thoroughly, we think. Whether pure meal, or part meal and flour, we advise to mix the hasty pudding very thin, and then cook it down by at least half an hour's boiling—an hour or more, improves it. While about it, always make a large quantity so as to be sure to have a full supply to slice up and fry for breakfast. It is economical, and is relished by almost everybody.—Ed.]

"Uncle Sam's Fried Cakes," (so-called because they were invented by our "Soldier Boy.") Take 1 quart flour, 2 tablespoonfuls shortening (butter or lard), 2 tablespoonfuls vinegar, 1 teaspoonful soda, 1 teaspoonful salt, and warm water enough to fit the dough for rolling.—Emily C. Cook, Saratoga Co., N. Y. [In this case the vinegar takes the usual place of cream of tartar to set the carbonic acid free from the soda. We suppose the other ingredients are first thoroughly mixed with the flour, and the vinegar afterward added with water.

Jersey Cow "Treasure."—We have received from T. A. Denison, of Hampden Co., Mass., a photograph of their family pet, a Jersey cow, of which he says: She is 5 years old, weighs 780 pounds, gives 15 quarts of milk per day at her best, and 6 quarts of milk yield 14 to 16 oz. of very bard, fine grained, high colored butter. One day's milk, 2 months before her time to calve, yielded 15 oz. of butter, when she had been giving milk more than a year. Twenty years' experience leads our correspondent to the conclusion that no breed equals the Jerseys in value as family cows.

A Great Rat Hunt.—"Rat Hunter" writes as follows: "An article in the *Agriculturist* on the subject of catching rats by ferrets, induces me to give the methods of destroying rats in Clinton Co., O. A rat hunt is decided upon—a meeting is called, and two 'captains' appointed, who choose their men alternately to any number they wish; the parties then appoint a committee of three to count the tails of the rats caught by both parties. A time is appointed for the hunt to close. Then the tails are all counted, the party having killed the least number, furnishes a free supper to both sides. A hunt of this kind was ended on the 26th Nov. at New Burlington, Ohio. Each of the sides killed over 8000 rats. A sumptuous supper was given on the evening of Nov. 29th, of which over two hundred ladies and gentlemen partook, and every thing passed off pleasantly. Let every community adopt the same plan, and there will be many rats destroyed, and few left for ferrets and patent rat traps."

Tall Buckwheat.—Wm. A. McCleary writes that he settled in the green woods, October, 1865, and after clearing a piece, raised among other crops, broom corn and buckwheat, last summer—the former grew 15 feet high, the buckwheat grew 7 feet 10 inches high, and yielded 28 bushels to the acre.

The Bee Periodicals.—Two Bee papers started in this country during the past season. One made a start *de novo*—the other revived and took a fresh start. Things did not seem to work quite rightly, or our hand and word of greeting would have been prompt and cordial. The Am. Bee Gazette, published in this city, departed this life a few weeks since; the Am. Bee Journal, of Washington, as "next of kin," inheriting its list of subscribers and wordly effects. We hope its excellent foreign department may be continued in the Journal. We have pleasure in commending the Journal to our readers, and wishing it merited success.

Beautiful Grape Leaves.—J. W. Hinks & Co., Bridgeport (Conn.) Nursery, sent us some leaves of Rogers' No. 19 grape, that were colored as beautifully as the autumn tinted leaves of the maple. They state that the foliage of several of Rogers' numbers does the same when it escapes early frosts. As far as we recollect, this peculiarity has not before been noticed.

Laurel Poisoning.—E. A. Holcomb writes, that when a lamb is poisoned by laurel, he takes a hard lump of fine salt—such as is usually to be found in a sack where the grains have caked together—as large as a walnut, puts it in the animal's mouth, and holds up the head until the salt is swallowed. For sheep and calves, a little more. He hastried many remedies, and considers this the simplest and most efficacious.

Feeling-in.—M. J. Skinner criticises the spelling of this word, and suggests that if it is derived from the saxon word *hela*, to cover or conceal, it should be spelt accordingly. We do not think the word has any such derivation; it is a short and convenient rendering of the old garden phrase, "laying-in-by-the-heels."

What may be Done with Small Garden Plots.—I. K. Jessup, of Staten Island, writes us, that upon an oval piece of ground, 19x37 feet, he raised 820 lbs. marrow squashes, 1 bushel tomatoes, 37 peppers, and 8 egg plants.

A Mechanical Plowman.—A few days since we were called upon to witness the operation of a contrivance, which we designate as a "mechanical plowman." The idea is not a new one. There have been other contrivances for holding and guiding the plow, and whether this one possesses merit sufficient to make it a success, the future must determine. We found a plow without handles, having a rather short beam fastened at the end into a sort of baby-carriage affair, consisting of an iron frame with adjusting screws set upon two little wheels, one of greater diameter than the other. The inventor is a German, and the plow was a common German one of modern construction, by no means superior to our good plows. Two horses were hitched close to the little carriage, and the plow being on its side, the team was started in a path from which Lima beans had just been

removed and full of stubs of broken poles. The plow instantly righted itself, and laid a fair furrow, though the wheels had no furrow to guide them. The second time round it did perfectly good work. When it struck a stub it was partly thrown out or turned, but got at work again so quickly that one hardly noticed it. With a quick and strong jerk one might throw the plow out of the furrow, but it would get back again almost instantly. It was set to cut about 6 inches deep and 10 inches wide, and in steady going and even soil it did this, but the soil was variable, and on hard packed spots it inclined to run shallow, and where it was very mellow, it would go deeper. The depth and width of the furrows is very quickly and easily regulated by screws, and the set of the wheels is changed for different depths. The trial was made upon the farm of Mr. Breck, of New Durham, N. J., a thoroughly practical man and no way interested in the implement. He uses it in preference to good plows of his own, and, as he says, by a little practice he quickly gained facility in its management. Stones, he says, will throw it out or stop it; if thrown out, it sets itself again quicker than one held by hand, and if stopped, requires to be lifted or pulled back and eased over, as any plow would be. On the whole, the thing looks practical and handy. For a foreign-made article it is very light. Still, its strength has been well tested, and as we understand many will soon be made, we may expect to see it put to the test of hard and diverse usage. The inventor is Mr. F. Volkmann, who has U. S. Patents for the essential features. See advertisement. We can hardly over-estimate the importance of the invention, if made easily adaptable to our plows of different sizes, provided it proves practical.

Bahia Roots.—"Subscriber"—Keep your Bahia roots just as they come out of the ground, until spring. Do not pull the roots from the stem, unless you wish to destroy them. They must be kept attached until the buds are started in the spring, when they are separated in a way to give a root to each bud.

Club-Foot in Cabbage.—"Subscriber," Conn.—This is ascribed to an insect, or rather to a kind of centipede; plenty of lime in the soil is said to prevent it.

"What can be Done for formerly good land, now covered 3 or 4 feet deep with creek gravel?" is a question asked by an "Old Subscriber."

How to Thaw out Pumps or Water Pipes.—"The simplest way in the world."—We must repeat directions given, and repeated in years gone by. Procure a piece of india rubber pipe as long as any emergency will require. It should have a little less than a quarter of an inch bore, and walls thick enough to be quite stiff. Apply one end of this upon a common funnel, and run the other end into the water-pipe down as far as the ice. When hot water is poured in, the ice will melt before the end of the tube out of which it flows with great rapidity, and of course the tube must be pushed along down as fast as the ice melts.

Barometer in the House.—J. Mendenhall, Parko Co., Ind., asks, if the indications of the barometer are affected by the heat of the room in which it is placed. The heat expands the mercury, making it lighter, and in nice observations a correction for temperature is made. The difference is of no consequence when the barometer is observed merely as a weather indicator.

Acids and Alkalies—Poisons.—In November we gave a general article to explain to the unscientific reader the common terms "acids" and "alkalies"—mainly with reference to the article on "Soaps" following it. An incidental allusion was made to these substances as poisons, whereupon a hyper-critical correspondent of the Country Gentleman comes out with a column headed "dangerous advice," and garbles our remarks to sustain his anathemas. Let him go back and read, and then quote aright what we did say, viz., that if an acid is accidentally swallowed, "a strong solution of soap swallowed freely, is the best common remedy;" that is, one always at hand. That was the whole gist of our remarks, which were not intended to discuss poisons, and "Chemists" will find it hard to create any sensation by his exclamation of "Dangerous Advice."—We may ere long give a chapter on poisons and their treatment.

Low Priced Sewing Machines.—A considerable variety of these have been offered, and the number is increasing. One sold under different names, for \$5 by some, and for \$10 by others, is a small affair, costing the dealers \$2 to \$2.50, and would be dear to any purchaser at 50 cents. We have examined most of the machines advertised, or offered by private circulars for \$5 to \$25, and have yet to find one that we would advise a friend to buy. A dozen or more of them have been refused admission to our columns. We saw a new one the

other day which is simple, and with further improvement, it may come into practical use, but it is not yet tested enough, nor well enough manufactured, to be worth buying. One caution we advise our readers to heed, viz.: Never buy any sewing machines to be turned by hand—as most of these low-priced, but *dear*, machines are worked. We consider a table and a good pedal gearing to be worked by the foot, as *indispensable* to any useful sewing machine. Instead of purchasing any hand-worked machine, however cheap, it is better to reserve the money until it is increased by interest and otherwise to the cost of a good machine.—It would give us great pleasure to find a really practical effective machine retailed at \$20 to \$30; it would be a boon to multitudes of housekeepers; but we know of no such machine yet.

In Winding a Watch, always be careful to have the tube of the key thoroughly *clean*, picking out any lint gathered in from the pocket, and removing the smallest trace of dust in it. This is very important; the slightest particle of dust may fall in through the key hole and clog some of the delicate works. More watches are injured from this cause, and require frequent cleaning, than from all other reasons. A watch should never be wound or opened when dust is flying in the air, nor should it be opened with soiled fingers.—New watches, even of the best manufacture, require a year or so of wear to get all the parts smooth and in proper running order, so that a new watch can hardly be fully regulated to entirely accurate time the first year. The moving of the regulator when very near the right point, is so delicate an operation that a long time is required to adjust it exactly; one may sometimes *chance* to hit it on a first or second trial.

Hint to Watch Manufacturers.—From the great difficulty of regulating a watch exactly, referred to in the item above, we suggest to manufacturers, and inventors, the contrivance of some kind of screw, or other arrangement, by means of which a more slight change can be readily given to the length of the chain spring, than can now be made without the aid of the magnifying glass used by watch repairers. The screw on a clock pendulum is much more convenient than the index arm for regulating a watch. This hint is at the service of the American Watch Company, or of any one disposed to apply it.

Lime, Water and Fire.—S. W. Stewart, Newcastle Co., Delaware, had his barn set on fire during a heavy thunder storm. He wishes to know if the conflagration was probably due to the lightning, or to some lime that was stored there. As the barn had two good lightning rods, and as the lime was placed close to the side of the barn, where the rain could be blown through the cracks, we conclude that the lime, or rather the water, was in this case the incendiary. He thinks, that if it was due to the presence of the lime, the fact should be published for the benefit of others. We supposed it was generally known that lime, in combining with water, or in "slaking," as it is termed, evolved sufficient heat to set fire to wood and other combustibles. Only a few weeks ago, Doct. Grant, at Iona Island, had an experience of this kind. The Hudson made an unusual rise and overflowed his dock, on which was a shed having a considerable quantity of lime stored in it, and a conflagration was the result. It is not an unusual occurrence that vessels having lime as part of their cargo, are lost by fire. How small a quantity of lime will generate heat sufficient to set fire to wood, we cannot precisely state, but a few ounces will produce a glowing heat, and a pound will cook a beefsteak. It is better to lose the value of a few bushels of lime than to run any risks in storing it.

Basket Making.—W. B. Waldo suggests that some one who knows how to make willow baskets for farm use, should communicate such instructions through the *Agriculturist*, as will enable farmers who have osiers to make their own baskets. We heartily endorse this request. Who will respond?

The Indelible Pencil for marking clothing is much more convenient than ink, and equally good as to permanence—we judge after several months' trial.

Castile Soap.—"S. F. S." asks, if this could be home-made. It could be by an expert soap maker, but it would be found rather expensive. In the true article Olive oil is the only fatty material used.

Vinegar from Sorghum.—L. F. Miller, of Hardin Co., O., asks: "Will raw juice of sorghum make good vinegar?"—We have no experience, but to put the question in another form: May good vinegar be made from sorghum juice without evaporating? If so, how? The syrup is often used in making vinegar.

Large Poultry Establishment.—We are gratified to learn that a project is set on foot by honorable and responsible parties, well fitted for the undertaking, to test the question of the profit of a large poultry farm. It is proposed to be located the farm near New York, and attention will be given to raising pure breeds for sale, and also eggs and poultry for market. We think the success of this enterprise would put the trade in fancy poultry on a reliable basis.

Sliding or Balance Gates.—These gates made as described in the *Agriculturist* for June last, page 219, and in the number for November, 1864, p. 312, are so simple and excellent, that many of our readers have adopted them, and some are annoyed by persons who have patented "improvements" upon the principle which consist in swivel rollers of different patterns (we know of three). The parties who sell those rollers, or the rights for their use, tell the public that their patent covers the use of the *gate*—which is not true. It only covers the rollers, which are, perhaps, an improvement for gates much used, but not for field gates opened no oftener than ordinary bars. We supposed that the principle of the gate itself was not patented until quite recently. Now it seems that it is one of those still-born patents which are given and not used—no effort being made to introduce it extensively. The Patentee is Ami C. Tell, of Galesburg, Ill., whose patent covers the principle. The fact that this principle is patent should discourage no one who wishes to use it. The roller Patentees, however, should themselves make terms for the use of the principle.

Potatoes in a Warm Cellar.—"J. W., Rehoboth, Mass. No vegetables will keep well in a warm cellar, except sweet potatoes. The temperature should be as low as possible, and yet not freeze. A mild uniform temperature is better than a fluctuating one, averaging considerably lower. A cellar where the thermometer will stand between 40° and 46° in winter weather, will keep roots perfectly well. Keep the cellar well ventilated, the potatoes covered with straw, and watch the temperature to guard both against heat and cold.

Experience with Sorghum.—L. Grafton, of Pulaski Co., Ind., writes, giving his experience as a sorghum syrup boiler. He says that the old original black seeded sort makes the best molasses. The nicer it is stripped, the better, and green cane makes an inferior product. He appears not to hold strongly to the theory, that green cane makes sugar, while the ripe makes syrup. Cane cut when ripe, and worked up will make more syrup than if stored a while, but it improves the quality of the product to store the cane. He planted the White African cane on good black soil, and expected to make sugar. A small quantity cut early and boiled down, tasted salty. This was accounted for by its having been evaporated in a meat pot. A quantity of juice expressed with a light pressure, boiled down in an evaporating pan, had no such taste, but when a hard pressure was given, the syrup had the same "tang" again.

Arbor or Trellis.—G. T. Tanner, Bristol Co., Mass., has his vines planted, and asks if he shall put up an arbor or a trellis for them. A trellis by all means, as the vines have a much better exposure to light and air, are always accessible, and easily kept under control. If an arbor is needed for a screen, we would cover it with vines, but never build one on purpose for vines.

Do Weeds Emigrate with a People? is the substance of a letter from a "Doubter." They do just as far as the people take the seeds of weeds along with them. The more civilized the people, the more agricultural and other seeds they would take from their old home, and would thus sow many weeds with their first crop. Besides, the seeds of weeds will be taken in the wool of sheep, in packing straw and other material, and in a hundred unthought of ways. Some seeds are carried by the winds, and others by streams, but the greater number are taken to a new country by human agency.

Tree Medicine.—We have in general terms expressed our opinion, that no medicine would help trees, and have refused the advertisement of several of these tree medicines. We find the following in the Country Gentleman, of Nov. 23, in relation to one of these compounds: "J. D. Wisener, West Dresden, writes us as follows: P. S. Sheldon's patent composition for fruit trees has been tested in this vicinity, this season, on hundreds of trees. The result has been worse than failure, as it has killed quite a number of thrifty trees, and others are as good as dead. It was removed a few weeks after it was applied, or it would have been far worse for the trees. Wherever it washes down the tree, the bark dies and cracks open to the wood. There are also borers in the trees now."—The advertisement of this stuff was

offered to us, and when its composition was made known, we refused to publish it, on the ground that we could not see how a well known poison could kill the borers, unless actually placed in their holes, and that injury might result from its use. The above shows that our view was correct, and all other persons having tree medicines for sale will please take notice. We have before us a circular of a "Patent Fruit Tree Invigorator," which does still more wonders, and makes "mineral gases," and "air gases" form a strong bud, besides a lot more of "gas" about keeping worms, curculios and borers from the tree.

Unnatural Grafting.—"Inquirer" takes exception to our statement, that a common chestnut will not be converted into a Spanish chestnut by grafting on the Horse-chestnut. He cites the grafting of the pear upon the Hawthorn as an instance of the union of plants as dissimilar as the Chestnut and the Horse-chestnut. The best advice we can give our friend is, to study the structure of plants a little, and he will not be so apt to be misled by similarity of names. He has seen somewhere a drawing of a Horse-chestnut stock prepared for grafting with the Chestnut. We can beat that; we have seen a drawing of a peach not only grafted on, but growing on a willow tree! The value of a drawing depends upon its source.

Death of Siebold.—Perhaps no one else has so largely contributed to our knowledge of Japan and its productions, as Philippe Francois de Siebold, who died at Munich, the 18th of Oct. last, at about the age of 70. He accompanied the expedition sent by the Dutch Government to Japan about the year 1823, and resided there for a number of years, in the enjoyment of peculiar facilities for acquiring information about the country and for procuring plants. Of late years, introductions from Japan have been numerous, but horticulturists must ever be indebted to Siebold for some of their choicest plants.

Salt as a Manure.—"The reason why salt acts as a manure," says the N. Y. Tribune, "is because it contains much of the quality of unleached ashes." Shade of Solon!—Takedst thou thy mantle with thee when thou ventest at novel writing?—In the same way a stone quarry 'contains much of the quality of' a brick meeting house. Salt contains soda; ashes contain potash. Potash and soda are about as much alike, being alkalies, as brick and stone. Ashes are alkaline, salt is not. Soluble potash (contained in ashes) is a rare, yet very desirable substance in most soils; soda (contained in salt) exists in abundance—more than the plants need. The uses of salt in agriculture are more discussed and less understood than almost every thing else. Its action may be beneficial, or the reverse, and it is often neutral.

Long Keeping Squashes.—H. L. Loomis, Westfield, Mass., writes, that a squash, a cross of the Hubbard with some other, raised in 1865, kept sound until the middle of Nov., 1866, and asks if we ever before knew a squash to keep 15 months. We have frequently known the old Winter Crookneck to keep until the same kind was ripe again, a year at least.

Coal Tar and Rats.—A. Ransom, of Ulster Co., N. Y., says that rats dislike coal tar very much, and that he is in the habit of daubing it about their holes and runs, with good results. Taking the hint from the suggestion to dip rats in red paint, he proposes to dip some in coal tar and let them go. Mr. Gilbert J. Green, says: "Coal tar, mixed with sand, to the consistency of thick mortar, is an effectual stopper to rat holes. The process is not patented, and a sure cure is warranted."

Wonderful Phenomena.—Accounts of phenomena are frequently sent to us for an explanation, which, as they are related, are inexplicable. Many persons, who would not for any consideration misrepresent a thing, are simply inaccurate observers. For instance, we have an account of a quince found two and a half feet below the surface of a gravel bed. The quince "had all the appearance of stone" when broken to get out the seeds, which were planted and grew. It is assumed that this was a petrified quince, and we are asked, "how long would a quince lie buried before it would petrify, and how long would the seeds lie in it and come out in a condition to germinate." In an ordinary gravel bed it is not probable that a quince would ever petrify, and no one can tell how long seeds will retain their vitality when buried below the influences that induce germination. Had this been a really petrified quince, containing living seeds, it would be very strange, but the probabilities are all against its being such, and the buried quince ceases to be wonderful. Another remarkable instance is cited, of a Black Currant bush, in the crotch of a pear tree, where it grew and produced fruit for many years. To decide whether this presents anything out of the ordinary course of things, one must examine what is the real relation between the two. The crotch of the pear tree may have

formed a convenient depression to retain dust, decayed leaves, etc., and thus form a soil for the bush; the case would then be no more strange than if it grew in a flower pot. We notice, almost every season, Ailanthus trees, two feet or more high, growing upon the stone window caps of buildings in New York City. Some plants, if shaded, will get along with an astonishingly small amount of soil, and the Ailanthus finds enough in the dust of the crevices of a stone or brick building to allow it to make a vigorous growth. A good observer puts objects through as searching a cross-questioning as a good lawyer does a witness. Every child should be taught some branch of natural science, if for no other purpose than to teach him how to observe accurately. The lack of this power gives rise to a large proportion of the wonderful stories that are spread abroad and handed down in print and by tradition.

Is Snow a Fertilizer?—"Farmer," of Sullivan Co., N. Y., writes: "I have frequently heard it said that snow is very beneficial to land, and hence it is sometimes called the 'poor man's manure.' Although this is a commonly received opinion, I have hitherto failed to meet with any one who could explain it upon philosophical principles, and have been led to doubt the truth of the assertion. Why is it said to be so?"—*Answer.*—Snow absorbs from the atmosphere very considerable quantities of ammonia, which is especially abundant in the air near cities, as it is set free from coal and other fuel. It is a warm covering, protecting the plants covered by it, especially such as the grasses and winter grains, from the unfavorable action of frost, for it matters little how deeply the ground is frozen, a good bed of snow lying upon it several weeks will thaw it all, and even permit a growth of grain and grass to take place under it. When it melts, the soil has the benefit of the ammonia, and any fertilizing dust that the snow may have caught, and the snow-water besides contains much oxygen—hence the effects are like those of manure, and the reason for the popular judgment, which is quite right.

P. P. Pea.—Seedsmen and all others will please take notice. In August last, we published a note from a valued correspondent, to the effect that Carter's First Crop Pea was a late one. Our friend, by some mistake, had got the wrong sort. In September, pages 311 and 314, we gave testimony on the other side. These last articles seem to have been overlooked, as we still get many notes from Seedsmen and others, on the matter. Now, be it understood that, as far as evidence can go, Carter's First Crop Pea is a first-rate thing, and please don't write us any more about that particular pea.

Difficult to Answer.—W. L. Lent, Seneca Co., Ohio, asks: "Can grapes or Osage Orange be grown on a clay side-hill, from which the surface soil has been removed by grading?"—Generally, no; but there are some kinds of drift, often called clay, that are good grape lands. It is a local question, and difficult to answer.

Lime Water and Cream of Lime.—"L. R. V."—Lime water is a saturated solution of lime. Lime is very little soluble in water, one part requiring about 700 parts of water. A quantity of slacked lime is put into a tight vessel of water and stirred up, and after the undissolved portion has settled, the clear liquid is poured off. Cream of lime, or milk of lime, is water with enough undissolved lime in it to make a thick mixture.

Pelargonium will not Bloom.—"S. F. S., Setauket, L. I. One of the difficult cases to answer, as you do not say whether it is in a dwelling or green-house. In either case pelargoniums need to be kept rather dry and cool until towards spring, and then be started into growth by plenty of heat, light and water.

Hubbard Squash.—"Staten Island."—This variety will sometimes come splashed with orange colored spots, and be in all other respects like the clay-colored. One of the distinctive characters of the Hubbard is its very hard shell.

Insect on Plums and Cherries.—G. Tullar, Oswego Co., N. Y. The insect that destroys your plums and cherries is the Curculio, which is able to fly as well as to climb. Any invention for preventing its ascending trees will therefore be of little use.

Snails in the Cellar.—J. W. Hathaway, Macon County, Ill., finds that a toad kept in a cellar where snails are troublesome, soon disposes of them.—Another writes that he has found a land tortoise or terrapin to perform the same service.

Salt the Slugs and Snails.—J. S. Swain, of Jacksonville, Fla., says, salt sprinkled freely in the haunts of snails and slugs in the cellar, is a perfect bane to them. He has tried it with success.

Another Agriculturist Editor.—

We have an announcement to make which will doubtless gratify our readers, as it does ourselves. It has been the policy of the Publishers of this journal to secure the best possible Editorial aid to be obtained, at whatever cost, and the result has justified the policy. One man, of even moderate ability and experience only, may collect enough readable matter of some kind to fill up a weekly sheet; but to prepare a thorough-going journal, varied in its matter, pruned of superfluous words and sentences and full of condensed thought, reliable in all its teachings, and treating on subjects so multitudinous as are embraced in the labors of the Farm, Garden, and Household, there is needed the combined thought, experience, and observation of a considerable number of first class men—the more, the better. If every page or two has the entire thought and investigation of one such man, the paper must certainly be far superior to what it would be if only one man spread his thoughts and repeated himself over twenty or thirty pages each month.... While the *Agriculturist* will continue to have the editorial labors of our Associates, Messrs. THURBER, WELD, HARRIS, FITCH, and others, who have done so much to make the paper what it has been, we have at length prevailed upon Rev. Wm. CLIFF to join our Editorial Corps, and he will enter upon his duties here soon after the present number goes to press. Mr. Cliff became widely and very favorably known by his "Carriage Views of Farming," and other valuable contributions to the press, some twenty years ago, and he has given us occasional editorial aid during the past fifteen years; but his practical labors as a cultivator, his pastoral and other public duties, and the care of the extensive Woodlawn Cemetery, of which he has been Comptroller or Superintendent for some time past, have left him little time to devote to his pen. In the wide and influential field upon which he now enters, he will doubtless do good service to the country.—PUBLISHERS.]

Capital, Reliable Advertisements

fill all the space we can spare to that department. Many more good parties, late comers, wanted room which we could not give, and a multitude was shut out under our rules, which exclude all secret and deceptive things, and require evidence that the advertiser has both the intention and ability to do what he promises. It is a good time to study these business columns well, and find out what is for sale, by whom, and make arrangements for the spring stock of needed implements, etc., and the other things wanted now. It will please the advertisers, if in writing to them for catalogues, or circulars, or sending orders, they are informed where their advertisements were seen. They like to know where they find the largest number of wide-awake, enterprising readers. One man tells us that last year he advertised in just 300 papers, received 2900 orders, and that he knows that over 2600 of them came from the *Agriculturist* readers.—Another says he set aside just \$10,000 for advertising, and that the \$600 paid the *Agriculturist* brought him more good business than the \$9,400 paid elsewhere. Many others talk in the same way.

Special to Advertisers.—

Our new advertising terms are announced in the proper place. A little advance is made, but not so much as the increased circulation would really warrant. Our basis for ordinary advertisements is, one cent, or less per line for each thousand subscribers, as we expect to print 150,000 to 200,000 or more copies the present year. The subscriptions so far are 80 per cent above the same period last year. If this ratio continues a little while longer, we shall exceed 200,000. Based on circulation alone, our terms are the cheapest in the world, to say nothing of the fact that our advertisements are select, and are trusted by the reader; that they are before the reader a month at least; and that they are beautifully printed on small pages and are thus easily seen.—To merely print 150,000 cards containing 5 square inches of reading matter, would cost at least \$600. To print that card in this paper, and have a copy sent into 150,000 families, one in a place, costs less than \$60. At our old terms the advertising would not pay much more than the expense of the paper they are printed on, as any one acquainted with the cost of such paper can readily calculate. (See note on "Capital Advertisements" above.)

"Proper Bad."—

A "Rural" paper, published not a thousand miles from Rochester, annually, about the close of its subscription year, makes itself ridiculous and annoys its readers, by a billious overflow toward the *Agriculturist* and one or two other journals. This year its groans indicate almost expiring agonies. Its latest special cause of complaint arises from the fact that some extra copies of the *Agriculturist* were sent into half a dozen towns in Western New York, where the *Genesee Farmer*, which we purchased, formerly circulated. We guarantee that neither the Mail clerk, nor his employees, when sending those papers, had the least thought of "disturbing" or "displacing" the "Rural." They have

too much compassion for their Weakly friend. They were not thinking of him at all, or they would have remembered that he had a mortgage on, owned, and possessed, all the farmers of Western New York, or claims to.—But why is he so disturbed at the apparition of an extra copy or two of our beautiful sheet in that region, where thousands of copies go regularly? Oh! we see.—One of his scattered subscribers by chance saw our paper. Is he so afraid of the comparison? Perhaps his conscience troubled him lest that subscriber should see how extensively the *Rural* has copied from our paper and books—transferring our beautiful and costly original engravings, and ideas, without a word of credit.—Pray, keep cool, friend *Rural*; we will sin as little as possible, though it is hard to suppress the wish to let your readers occasionally see a real, live, finished, original paper, that has had a whole month's work of preparation, and is not hastily thrown together and illustrated with borrowed or stolen engravings. If you don't stop scolding, you will get down toward a par with your competing "*Rural*" whose editor will fume at us until he dies, because we won't notice him, won't advertise for him, or exchange with him, and because we once showed up his sales of patent "Bee-hives" without any patent, and his selling the address of young ladies for sixpence each. Harris Brothers' "gift enterprise" is helping that "*Rural*" to subscribers. Pray don't get down to its level.

"Tim Bunker."—Old readers of the *Agriculturist* will be glad to know that a spicy letter from our old friend, of racy, practical, homely wit and wisdom—Timothy Bunker, Esq., of Hookertown, Conn.—is in type for our next number. 'Squire Bunker has been so much occupied of late, that it has interfered with the claims which readers of the *Agriculturist* seem to have upon him. We can now congratulate our readers on the promise of a letter from him every month or two.

Copeland's Country Life.—

When the new and enlarged edition of this work appeared, we recommended it as a useful encyclopedia of rural affairs. A further examination of the book has resulted in our purchasing it and adding it to our list of standard publications. There is scarcely a topic relating to the management of gardens, green-houses, orchards, and all the matters pertaining to small farms and country places, that is not intelligently and pleasantly treated. It does not profess to be a work upon agriculture proper, but it is one that will meet the wants of a large class who live in the country. We do not mean to say that it would not be useful to the farmer, for it would be, in teaching him how to give his home pleasant surroundings. The work is abundantly and well illustrated. A new issue is now ready, on fine paper, in beveled boards—912 pages. Price \$5.00. Sent by mail post-paid.

The American Gardener's Assistant.—

By Thomas Bridgeman. New Edition, Revised, Enlarged and Illustrated, by S. Edwards Todd. New York: William Wood & Co. The work of Mr. Bridgeman first appeared many years ago, and was in its day a standard authority. The name is an honored one in American horticulture, and when a new edition of his work came to hand, we felt glad that the "Gardener's Assistant" still lived. Upon looking over the volume, we found illustrations taken boldly and bodily from the *Agriculturist*, and from books of which we hold the copyright. We were astonished to find that honorable dealers, like William Wood & Co., had thus taken the property of others. Our astonishment was at an end when we turned to the title page, and found by whom the work was revised. A committee of twelve men may decide on this matter of illustrations, and we will turn to the literary portion of the work. We doubt if so many blunders were ever before enclosed in one cover, and one hardly knows where to begin to notice a work, claiming to be "revised," in which old errors, thought to be truths in their time, are so mingled with modern blunders. As a specimen of the recklessness with which names are handled, we are told under Cabbage, p. 55, "The *Brassica rapa*, or Turnip-Cabbage, produces its bulb or protuberance," etc., and on page 136 we have *Brassica rapa*, given as the name of the Turnip.—The "reviser" is even less at home among fruits than he is among vegetables, and the article on the grape is of about as much use in the present state of grape culture, as an almanac of thirty years ago. As a matter of curiosity, we copy the names of the grapes treated of. We first have, on page 105, a "Select Descriptive List of Native Grapes," which gives notes on Alexander, Blond, Carolina Perfumed, Catawba, Cunningham, Elsinburgh, Hides Eliza, Isabella, Lufborough, Maddox, Norton's Virginia, Pond's Seedling, Scuppernon, Warren and Woodson. A "select" list truly! Evidently pleased with the amusement of making grape lists, the "reviser" gives us a few pages further on another (p. 111) "Select Descriptive List of Native Grapes," in which we have this time Diana, Gil-

bert's White Shonga, Lenoir, Missouri, Ohio, Shurtleff's Seedling, Uchee Grape, and White Scuppernon. The pearls present a most melancholy array of antiquated varieties, with a number of illustrations, only one of which is referred to in the text. The list of strawberries gives some twenty-four varieties, not one-fourth of which are now extant; the Wilson, Triomphe de Gand, Scott's Seedling and Trollope's Victoria are represented by bad engravings, but not a word is said of them. The flowers are still worse managed, as witness the Dahlia, in which a gentleman who has been dead a number of years, is quoted as if he had given recent information. It were a waste of time and space to point out the errors of omission and commission in a work, that in competent hands, might have been made valuable. The heirs of Mr. Bridgeman must indeed feel chagrined to see their name connected with such a jumble, and certainly must feel that an alteration is not always an improvement.

The Agriculturist Book Department.—

A few years ago, in response to their oft-repeated requests, the Publisher commenced supplying his subscribers with such books as they desired, sending them by mail, post-paid, without additional charge. The retiring of C. M. Saxton & Co., who were the leading agricultural Book Publishers, cut off the supply of many books, and it became necessary for Mr. Judd to issue some of these books in order to meet his engagements to furnish them. Subsequently, at the urgent request of many booksellers, and others, Mr. Judd purchased all the plates, rights to publish, etc., previously owned by Messrs. Saxton & Co., and increased the stock by other purchases, until he had control of a very large proportion of all the Agricultural and Horticultural books published in this country. A careful weeding was made, and more than half of the books were condemned, and their stereotype plates consigned to the melting pot, where it could be done without infringing upon the vested right of authors. Mr. Chaso, an experienced Boston publisher, was associated in the business, so that there should be no lack of business and editorial attention to the *Agriculturist*, but rather greater efficiency secured.—The Firm, and all associated with them, are ambitious to have the credit of supplying good books. With the large editorial power employed upon the *Agriculturist*, good old books are being revised, and first rate new books, edited with the same care that is expended upon the *Agriculturist*, are being constantly prepared. The field is an extensive one. Cultivators of the soil are waking up more and more to the importance of studying their business in all its bearings, and to meet the demand for good reliable Books, Pamphlets, Annuals, etc., is an important work. The Publishers say in their circular, that "they aim to exercise so much care that their imprint upon any book shall be a guarantee of its value." The *Agriculturist* is entirely independent in its sphere, though its issue by the same publishers gives it additional resources, financial and otherwise, so that this business connection makes it possible to furnish it to subscribers at a lower rate than could be done without this aid. Those who understand the matter, will readily see that the subscription money paid cannot of itself cover the cost of supplying such a paper.

Sundry Humbugs.—

Our letters, for four weeks past, describe 85 individuals, or firms, engaged in 14 different modes of swindling, or of corrupting morals. An analysis, and somewhat detailed exposure, is prepared, but we have not room for it this month. Several of these parties are consigned to the magistrates or policemen. The writers of over 200 letters, now before us, will please understand that those who have inquired about reliable parties will be answered by mail; all not thus answered may put down the parties inquired about, either as swindlers, or as being under investigation to be reported upon hereafter.—While waiting room to speak more particularly, we advise our readers to beware of all tempting offers coming by circular through the mails; of all gift enterprises, however sugar-coated by pretending to aid soldiers and their orphans, or needy artists; of all watch and jewelry tickets; of Gold and Silver Mining Companies; of recipes for washing, ink, vinegar, honey, etc.; of applications for catalogues of Female Seminaries, and lists of names of farmers and others; of low-priced sewing machines (see item elsewhere); of cheap burning fluids; of map publishers asking money for something to be issued hereafter; of wonderful new discoveries where money is to be sent; etc., etc.—Please continue to report to us all new schemes, as soon as they appear.

2,000 Good Words.—

Our Assistant who receives, examines, and sorts the large number of newspapers regularly received, says that during the past year alone, more than two thousand different editorial notices have appeared in these journals, strongly commending the *Agriculturist*. Our space is too valuable to allow repeating such notices.

The Prairie Wolf.

This animal (*Canis latrans*) which is found upon the Prairies of the West, from Mexico to as far north as lat. 55°, is the type in this country of the Jackal of the Eastern world, both in appearance and habits. Although naturalists differ on the subject, it is the generally received opinion that he is the same animal as the Mexican Coyote. In size, he is a medium between the common Red Fox and the ordinary Wolf. His head is shaped more like the former animal, having its long and sharp muzzle, while the whole form of his body is more that of the Wolf, and his tail, which is bushy and tapering, and his coarse hair, are unmistakably those of the latter. He is from 36 to 40, or 42 inches in length of body, with a tail some 16 or 18 inches long. In color he is usually of a dull, yellowish gray on the back and sides, sprinkled or clouded with black, the belly and inside of the limbs being white. His ears are large and triangular, always held in an erect position, and almost entirely coated with hair. He has four toes on each foot, besides a sharp claw on the inside of the fore-foot, about two inches above the sole,

and attached to the rudimentary toe, corresponding to the thumb. He has a sharp, snapping bark, which gives him the name, among the dwellers upon the prairies, of the "Barking Wolf." They live and breed in burrows, and have their young in April. They are very prolific, sometimes bringing forth 10 or more at a birth, and not often less than 8. They are very fleet of foot, more so than the ordinary Wolf, and hunt in packs, hanging on the outskirts of the herds of buffalo, on the lookout for stragglers, aged, halt, and maimed. Though small, they are a most terrible enemy when combined, and attacking in numbers. They will follow up a company of hunters for days, and loiter around their camps for the refuse of their game, of which they get quantities, as your true buffalo hunter only cares for the hump, tongue, marrow-bones,

and skin. They are afraid of man, and rarely, if ever, injure the hunter or his horses, although stealing into a still camp at night, they often cause the latter to stampede. The mule is an excellent watchman, for he no sooner detects their neighborhood by his keen scent, than he gives vent to his own, peculiar, musical bray, and

PRAIRIE WOLF OR COYOTE.—(*Canis latrans*.)

stands like a well-bred game dog, head and tail erect, and nose pointed in the direction of his enemy. The hunter then looks out for the safety of his game or provisions, for the little thieves are as expert as the New York pickpockets, and will appropriate his most precious morsels. They are killed for their skins, which, however, are not very valuable, and are used to fill up the scanty load of some not over-successful trader.

The Red Fox.—(*Vulpes fulvus*.)

Closely allied to the wolf and the dog, is the Fox, of which there are several distinct species in this country, and among these there exists a great tendency to varieties. The skins of the common red fox show diverse shades, some being very dark, (indeed there are those called black;)

others have a more or less distinctly marked cross, a stripe down the back and across the shoulders. The usual color is bright reddish brown, most intense along the saddle and shoulders. The face is nearly black, as are also the flanks; and the feet are black in front, the color extending up on the outside of the thighs. The

under jaw, the edges of the upper jaw, and the throat are white, and this color extends more or less upon the belly. The brush is rendered dark by many long black hairs, occurring among the reddish ones, which are more abundant and shorter. In the darker varieties of the fox the brush is often white tipped. The head and body measure 27 to 30 inches usually, and the tail to the tips of the hairs about 15 to 17 inches. They rarely attain a weight of 15 pounds, and 8 to 10 pounds is the usual weight. The young are littered in March or April, 4 to 6 in a nest. As the old one has these to provide for just when field mice and birds are least abundant, foxes are then boldest in their attacks upon poultry, and will even attack young lambs. We think, however, that lamb is not a favorite diet by any means, and that rats, mice, and small birds and eggs are much preferred to poultry of any kind—we are willing

to give the little rascals credit for all the good they do. Their habits, their great degree of sly intelligence and reasoning powers, are well known. They are active throughout the winter, and lives in burrows. In trapping the fox, to destroy the smell of iron, the trap should be smeared with fresh blood, or heated and covered with bees-wax, then set near their haunts, covered with light earth, or ashes, and fastened to a clog of 8 or 10 lbs. The surface all around should wear a natural look. Scraps of fried meat and honey may be distributed around the bed, but not on the trap, and no foot prints should be seen near. The genital organs of the female fox, or dog in heat, preserved in alcohol and smeared upon some object near the trap, will be most alluring. A fox will be very likely to follow a trail of bloody meat to the trap.

Walks and Talks on the Farm.—No. 37.

I notice from the papers that the receipts of sheep and pigs in New York are now greater than ever before, and prices have fallen a little. The best sheep only bring about 6 cts. per lb., live weight, and hundreds of poor sheep are sold as low as \$3.00 a head. It seems a pity to send such sheep to a distant market. After deducting the cost of transportation and other expenses, the prices received by the farmer must be very low. It costs no more to send a sheep to market that will bring \$8.00, than one that is slow of sale at \$3.00. If the expenses are a dollar a head, the farmer would get \$2.00 in one case, and \$7.00 in the other.

Pork will probably be lower for a few weeks. The failure of the corn crop will induce many farmers to dispose of their hogs before they are fat. The receipts will be very large, and for the time being, will depress the market. But it seems to me that after the first rush of half-fat pigs is over, it will be found that good, well-fed hogs are scarce, and the demand will be large enough to insure a fair price for the corn they have consumed. After severe cold weather sets in, however, pigs will not fat rapidly. The increase of weight alone, will hardly pay for the food. The profit of keeping them, if there is any, will be from the increase in price. With warm, comfortable pens, hogs, as a general rule, can be kept until after Christmas with advantage, on account of the advance in pork. But in a cold, dirty pen, they will eat a good deal of corn, and do little more than hold their own.

It is not half as interesting now to talk about pigs as it was last September, when our Rochester butchers were eager to buy them at 14 and 15 cents a lb. They are now a drug at 10 cents, and some have been sold as low as 8 cents. The city papers are rejoicing over the decline in prices. They were too high, perhaps. But to attribute high prices solely to the "speculators" is absurd. The speculators do not create the scarcity, they only avail themselves of it and buy for a rise. If it proves that there is no scarcity, they are ruined. But if there is an actual scarcity, they are really public benefactors, as by storing away the food until it is wanted, and thus forcing up prices in the meantime, they check consumption. If prices remained low, much more would be consumed, and in the end the scarcity would be greater.

It may be that farmers, tempted by high prices, have raised too many hogs, and that they must sell them at a loss. Certain it is, that with corn worth \$1.25 a bushel, there is little profit in fattening hogs at 8 cents a lb. It is a good hog that, with ordinary treatment, will give 7 lbs. of pork for a bushel of corn. Fed in a rail pen, cob and all, among the mud, it doubtless takes much more, especially in cold weather. The other day I wanted a new India rubber tube for my steamer, and a few lbs. of castings. The bill was \$5.75. Now, with corn at \$1.25 per bushel and pork at 8 cents a lb., how long, at the above estimate, will it take me to pay this bill out of the profits? I heard a farmer say last fall that "it took three bushels of potatoes to buy a pair of baby's shoes!"

With all the drawbacks in our business, I have no reason to complain. Farming is as pleasant and profitable as I expected—especially the former. Those who complain that the farmers charge such high prices do not understand what they are talking about. If our city

friends will practice as close economy as the farmer is compelled to do, they will be able to pay him remunerative prices for his products. He asks nothing more. And when the farmer prospers, other business prospers too.

The great trouble with farmers is, that they do not cultivate their land as well as they might. One reason of this has been the low price of produce. And now that we are getting good prices, the land is in such a poor state that too many farmers have nothing to sell. I know a farmer who had six acres of Peach Blow potatoes, which yielded him 250 bushels, all told. This was not owing to the rot, or to a bad season, but solely to poor farming, past and present. The land has never been manured, and the potatoes this year were not half cultivated. He works the farm "on shares." The profits, both to the owner and farmer, will not be exorbitant even if the potatoes bring \$1.00 a bushel. But if, on the other hand, the crop had been, as it might, 200 bushels per acre—say 1200 bushels, the extra yield at this price, would have paid for a little manure, and a good deal of cultivating. And this was all that was needed.

Working land on shares seems to be a poor business for both parties. It is to the interest of the tenant to spend as little for extra labor as possible, because the owner of the land gets half the benefit without bearing any of the cost. When the country was new and the land rich, a man could perhaps afford to give half the products, as he could get fair crops with little labor. But now that the land is more or less "run down," and it is necessary to build it up with manure and good culture, it is impossible for a man to expend the necessary labor and give half the produce for rent. It may be done for a year or two on land in high condition, but the farm must inevitably deteriorate under the system. A man might afford to rent a grass farm on shares, but not an arable farm. It is difficult to take one of our ordinary "run down" farms and raise enough from them, for a few years, to pay the cost of labor and support the teams, from the whole of the produce!

"What, then, is the value of a run-down farm?" Not much, these times. It would be cheaper, so far as immediate profit is concerned, to pay \$100 an acre for a farm in high condition, with good buildings and fences, than to accept as a gift one of these run-down farms. It is time this matter was understood, so that those uneasy mortals who are always expecting to sell, and consequently make no efforts to keep up and improve their land, should be compelled to turn over a new leaf, or else dispose of their farms at a low figure.

The advance of farm lands has been greater in the dairy regions than in any other districts of the State—certainly far more than in the wheat growing sections of Western New York. Dairy farms in Herkimer County have changed hands at two hundred dollars an acre. And yet I have always supposed that one acre of our land was worth two of their's. Farms can be had in this section at \$100 per acre—and dear enough at that! The high rates of wages and other expenses of managing an arable farm do not affect the farmers in the grass growing districts as much as they do us. We should learn from this fact, not to cultivate so much land, but to let a larger proportion lie in grass. This would reduce expenses, and yet give us heavier crops of grain. It is the one lesson which the history of agriculture clearly teaches.

We must, however, improve our grass land. Most of our pastures consist of low land, which produces little except coarse grass of very inferior quality. Nothing can be done with such land until it is drained. But if we would drain our upland, we should in many cases cut off the springs which feed the low land, and then a few surface ditches would be all that is needed to make these low pastures dry and productive.

The upland pastures must be top-dressed with manure. I am inclined to think that, for immediate effect, we can use our manure on grass land to greater advantage than in plowing it under for corn. I think I related before, that last fall I drew out some manure on an old upland timothy meadow that we intended to plow up in the spring for corn. The year before we mowed it, and the grass was hardly worth cutting. In the spring, however, I found we should hardly be able to manage so much corn ground, and abandoned the idea of breaking up this meadow. Well, we pastured the field, and you would have been astonished at the effect of the top-dressing of manure. As far as the manure went, the grass assumed a dark green hue, thickened at the bottom, and must have afforded three times as much feed as the other portion. The cows stayed pretty much all the time on the manured land, and evidently liked the grass.

The timothy on the unmanured portion was light, but what there was of it the cattle did not eat, and it went to seed, while the other portion was eaten close and gave a green succulent bite all through the season. I am fattening about 200 sheep, a dozen head or so of cattle, with ten milch cows, and some sixty head of pigs, little and big, black and white, and as Thomas says: "There will be some manure in the yard next spring, Sir, whoever lives to see it." I think of putting every bit of it on to the grass land.

When I bought this farm three years ago, I came from a temporary residence in the city, where we had a rather nice lawn and garden. And of course when we moved into the country, the first thought was to "fix up things round the home." I bought the farm the latter part of November, and the first thing I did on it was to set out a large bed of roses and one or two beds of flowering bulbs. The next, was to top-dress the "lawn." This took pretty much all the manure there was on the farm, except some loose horse litter that we used to protect the roses and other tender shrubs! All this time, the corn stalks were out in the field, and I can now very well imagine that such a mode of farming did not call forth any very flattering remarks from the passers by. One day, when I was busily engaged in attending to the roses, and a man was carting the manure and spreading it on the "lawn," a young farmer, whom I had known for some years, came along on a load of wood, and after looking on for a few minutes and ascertaining what we were driving at, remarked, "I'll tell you what I think." "Well, John, what do you think," I asked. "I think," he said, "*you've got a good many things to learn.*" I had sense enough not to press him for particulars, and he passed on. Well, I have made a great many mistakes in farming, but that was not one of them. The effect of the top-dressing on the grass was truly wonderful. We mowed it three or four times during the summer, and sowed a little guano on it in showery weather, leveled down some of the inequalities by taking the soil from under the grass without removing the sod, and batting them down with the spade, throwing the soil in

the hollows and—well we have now quite a respectable “lawn” for a farm home. I advise any city man, who turns farmer, to attend to such things the first year—for if put off for more time, they will never be done at all!

I received a letter to-day from a subscriber to the *Agriculturist* in Illinois. “I would like,” he says, “to get an apparatus for cooking food for a few hogs and neat cattle; and I notice that in your Walks and Talks you mention that you have one; and that D. R. Prindle, in his circular, publishes testimonials from you. Do you use his steamer, and is it a convenient apparatus, simple enough to be used without danger and without difficulty. Would his No. 2, have capacity to cook enough meal for, say 30 hogs and 10 steers? Or is there a better than his?”

I have used Prindle's steamer for two or three years. There is no difficulty or danger in using it. And it is a very simple and convenient apparatus. Still it requires some brains to manage it—and farm hands, you know, are rather deficient in that article. I have never had a man yet who did not think he could cook better and faster with an old-fashioned kettle. I have steamed a barrel of potatoes with it perfectly in $\frac{3}{4}$ hour; but I have known a man to keep the steamer going all day on one barrel, and not have the potatoes cooked at night! A boy generally, after a few weeks training, manages it better than a man, because less prejudiced.

But it must be confessed the steamer has faults. You can not tell when the water is getting low; and we have several times had it get dry, with a large fire underneath; and in one case we poured water in when it had been dry for sometime, and was nearly red hot. We came near having an explosion—at least near enough to frighten the person pouring in the water, though I presume there was no real danger, as the steam was not confined. Still it blew the water all over the room, and *cracked the bottom of the steamer*, and it cost me \$22 to get it repaired. The steam is conveyed from the top of the cauldron in a vulcanized rubber tube, to an iron pipe, which goes through the meal or potatoes, to the bottom of the barrel. This tube sometimes gets stopped up with the meal, partly or entirely. We obviate it by tying a piece of cloth round the pipe. You and I would have no trouble in correcting it, but those “hands!”

There would be a great saving of heat if the cauldron was set in an arch. It is now sheathed with iron, and the heat radiates from it and is lost. On the whole, I do not think it would pay to cook food for neat cattle. I have tried it for milch cows and found it too much trouble. It will pay better to cook food for hogs than for any other animal. Their stomachs are smaller, and they require more concentrated food. In steaming meal, I find that it is necessary to put in considerable water, and to be careful to have it well mixed. If any of the meal is dry, it will remain dry, no matter how long you steam it. The advantage of the steamer over a common cauldron is, that there is no danger of burning the meal. There is no absolute saving of heat; it is simply more convenient, and when the steam is up, you can cook another barrel as soon as the first is done.

Another gentleman writes me in regard to a mill for grinding grain. The one I have, on the whole, is not entirely satisfactory. It does not grind fast enough. Once, when I attended to it myself, with four horses, I ground twenty-eight bushels of peas in three hours and ten minutes. This would do very well. But it has

never been done since. The men do not like it. They prefer to take the grain to the mill and wait for it to be ground. And I find that if I set two of them at grinding, one to drive, and one to attend the mill, twenty-five or thirty bushels is all that they will grind in a day! The men are not lazy either. I have as good men as can be found—married men who live in houses on the farm, and possessing more than average intelligence. It is a lack of energy and self-confidence. They think a thing “can't be done,” and they are generally right, so far as they are concerned. But if you can attend to it yourself, all the time, get a good mill, and it will pay. I do not know, however, where there is a really good one. I wish the good people at the *Agriculturist* Office would look up the best one there is made, and offer it as a premium.

When I was pulling some weeds out of the potatoes last summer, the Deacon stood near and shaking his head, said: “There is too much top.” But one thing struck me: Notwithstanding that it had rained almost constantly for several weeks, I found in pulling up these large weeds that *the soil was really quite dry*. The potato tops completely covered the ground, and if there was any truth in the idea that growing crops shade the ground and keep it moist, this land would have been wet; yet the soil pulled up on the roots of the weeds was dry as dust. A correspondent of the Country Gentleman mentions a fact that appears to prove that weeds which shade the ground keep it moist. He says:

“To-day I was hoeing in my garden, where the weeds were one inch high, and scarce; there the ground was *dry* half an inch. One place, not two feet distant, had many weeds about four inches high, completely shading the ground. There, not a particle of dry earth is to be found.”

The fact may well be as here stated. But what does it prove? It shows, perhaps, that weeds which shade the ground, check evaporation of moisture from the *surface*, and that for half an inch deep such soil is not as dry as that which is exposed to the sun and air. But does it show that the weeds do not take up *from the soil beneath*, a large quantity of water and evaporate it through their leaves? Had the soil where the weeds grew been examined three, four, or six inches deep, it would probably have been found drier than that which was bare. One thing is certain: plants, during all their growth, take up by their roots and evaporate through their leaves an enormous quantity of water. Many experiments have been made which demonstrate this fact. Those of Lawes are the most thorough and extensive. He ascertained with the greatest accuracy, the amount of water evaporated by wheat, barley, beans, peas and clover. A Wheat plant giving in grain and straw only one pound of dry substance, evaporated during its growth, of 173 days, 247.4 lbs. of water; Barley, 257.8 lbs.; Beans, 208.8 lbs.; Peas, 259.1 lbs.; Clover (during 101 days), 269.1 lbs. In other words, an acre of wheat of 30 bushels and 1800 lbs. of straw, would evaporate during the spring and summer, 355½ tons of water, or over *five hundred gallons a day*. A crop of clover of 2 tons per acre evaporates in 101 days, 430 tons of water, or over 1,000 gallons a day! And yet a heavy crop of clover would shade the ground completely.

This water actually passed *through* the plants. Of course the exhalation was greater as the plants increased in growth. Thus a wheat plant in March exhaled 14.1 grains of water a day; in April, 41 grains; in May 162 grains; in June 1,177 grains; in July 1,535 grains a day. After this, as the plant began to mature, the ex-

halation decreased.—What we want for our growing crops is not a moist surface, half an inch deep, but a warm, moist soil underneath, where the roots ramify and imbibe their food.

I wish something could be done to break up the practice of tying the lines round the back in plowing. It is very convenient, but it spoils the horses for ordinary driving. It is hard work to manage them with two hands, and no wonder. They have to pull some lazy plowman along every day by the bit, and when he wants them to hack or turn round, he braces himself against the ground and pulls hard enough to spoil any decently broken horse in a week. I once saw a boy take the First Prize at one of the plowing matches of the Royal Agricultural Society, who drove his team without lines at all. Our horses are a little too lively for that, but still they might easily be trained to haw and gee, to hack, to turn round, and to stop, without using the lines scarcely at all.

You “do not see how holding the lines round your back in plowing and cultivating spoils the horse for ordinary driving in a wagon and carriage.” Simply because the poor horse has to pull hard on the bit all the time, and is obliged to set his neck so stiff that it soon loses all elasticity. And a stiff-necked horse is always difficult and unpleasant to drive. My men say they have to put the lines round their back to keep the horses from going so fast, and to guard against breaking the plow in case you strike a stone. In the spring I mean to get some cord lines just long enough to put on the handles of the plow, putting a short stiek between the horses fastened to the inside of the bits, and then say, “if the horses go too fast at first, they will soon get tired of it, and if you strike a stone and break a plow, you can go to the barn and get another one.” The light wooden stretchers between the horses' heads keeps them from crowding each other, or from getting too far apart, and you can plow much straighter. And then the saving of the leather lines is quite an object these times.

Raising Clover Seed.

This is one of the most profitable crops raised by northern farmers. It is not generally large in quantity, but so far as it goes, it yields large returns for the labor and money expended on it. From three to five bushels per acre may generally be expected, and this, selling at from \$8 to \$12 a bushel, is a good return for the labor. The culture of clover is simple and easy. The ground should be well plowed and harrowed fine, the manuring moderate. Such lands as bring good crops of wheat, oats, and barley, will produce good crops of clover. The seed should be sown early, the earlier the better. As clover does not last usually more than one year for a full crop, it is generally best to seed down the land to timothy at the same time; the latter to form the main crop of the second year. When the clover has got well established, it is the practice of many to turn in their cattle and sheep upon it. This furnishes excellent feed, and the cropping of it does no harm to the clover, but rather helps it. The stock are kept here until the middle of June, when they are taken out, and the crop allowed to take a new start. If kept on longer, the clover would not have time to mature seed before frost. By being fed down pretty closely over the whole field, the plants now start uniformly, and all blossom and ripen their seeds nearly at once, which is a very important matter. Attention to this point

can hardly be urged too much. The closer and even the feeding off, the better and more uniform the filling and ripening of the seed. Sheep will feed closer than cattle, and they should be relied upon for finishing off. As soon as the stock are taken from the field, plaster should be applied, which will give the plants a vigorous growth. A spell of dry weather may be usually expected during the mid-summer season and then plaster will be particularly useful.

The seed will generally be ripe by the time of the first frosts, and then is the time to harvest it. It is mown, and when wilted well, raked into small cocks in which it is left to dry—the cocks being occasionally turned over by passing a rake handle under them, and with one hand on the top, inverting them. When dry enough, let it be hauled to the barn, where it may be threshed and cleaned in a mill provided for the purpose. Or after beating the seed off from the stalks it may be left in a heap with the closely adhering chaff to heat slightly, when the seed is rubbed out and separated in a common fan mill.

Fig. 1.—ELEVATION.

Houses, Cheap and Convenient.

BY NARRAGANSETT.

[We published on page 53 (Feb. '66.), the elevation and plan of a comfortable dwelling for a small family, one adapted either to the vicinity of a large city, or to the interior of a village. These designs are not intended for farm houses, although the principles of comfortable living, upon which the plans are based, are equally applicable to farm houses, cottages, or villas. Our correspondent takes the elevation of the February house, and by a re-arrangement of the inside, gives us a plan adapted to a

Fig. 2.—GROUND PLAN.

family of a little different tastes and mode of life, and perhaps as convenient on the whole.—ED.]

In this design, upon the ground floor, as seen in fig. 2, are a Parlor, Bed Room and Kitchen; A, Porch; G, Front Entry; S, Stairway; F,

Pantry, connecting by slide with the sink in the Back Entry (E); C, C, marks the China Closet. Each room has independent facilities for warm-

Fig. 3.—BEDROOM PLAN.

ing; and while the rooms are in close communication with each other, they yet can be quite separate. The bed-room has a spacious closet. Upon the chamber floor (fig. 3), are three nice bed-rooms and four closets. Each room has direct access to a chimney flue. The stairway can be lighted by a glazed scuttle in the roof. This Cottage, if well built, may be made a comfortable, and as they say, a "genteel" house. It is very compact—not an inch of room is lost. If desirable, the partition between the closets over the pantry and back entry, may be moved a little to one side, making one of the closets larger; a circular window may be inserted in the gable; and to the room used for bathing, water may be carried by a force pump, and even heated by a boiler connected with the kitchen fire. Few plans of this size afford a greater amount of convenience than may be found in this simple design. True, the economy in side walls, accompanying square ground plans, is sacrificed to the greater light and airiness of the structure, but in a snug cottage like this that is a small fault.

Partialities at Fairs.

One of the minor hindrances to the success of our Agricultural and Horticultural Fairs, is the real or fancied injustice done to exhibitors. When a man takes great trouble and goes to some expense in preparing to exhibit stock or grain, or fruit or flowers, and then finds his articles slighted, and the premiums given to less deserving competitors, he feels hurt, and perhaps resolves to abandon the Society and its exhibitions. Every year witnesses cases of this kind. And so it happens that good contributors fall off every year, and their places are poorly supplied by new comers, or not at all. Not only do influential supporters drop off, but with their defection the quality of the exhibitions declines, and spectators go home every year declaring the Fair a humbug, not worth attending again.

Now, to avoid such troubles, it is important, first of all, to secure good men for judges. They should be men above all mean and petty prejudices and partialities, men thoroughly competent to decide on the merits of the articles presented before them, and who will give time and thought to their examination. They should be the guests of the Society and be entertained, free of expense, during the Fair.

The time for appointing the Executive Board who will select the Judges, is at the winter

meeting of the local Society. Let all the members attend this meeting, and see to it that good and true men are chosen for officers. Then, let this Board give time and careful thought to the choice of Judges. The success of the Society will depend much on this. But when the Judges have been appointed, the exhibitor should thenceforth dismiss all suspicion of partiality, and take the decision of the Judges as given in good faith. Let us ever remember that we are apt to think more highly of our own articles than we ought to think. The Judges have to look on all sides of a case in order to render due justice to all parties. Putting faith in their honor and fairness, we should bear with occasional disappointments quietly. This course is right in itself, and is the only way in which a Society and its fairs can be successfully maintained.

Nevertheless, it is important that the judges should feel their responsibilities as men, to render unbiased judgment, and we think that over every department a member of the Executive Board should preside, and while he watches narrowly the behavior of exhibitors, some of whom will leave no stone unturned to influence Judges in their favor, he should be ready to entertain objections to Judges or to their action; and in case proof is afforded of improper bias, it should be in his power to arrest proceedings and have a new committee appointed, or the unfair man removed. The position of Judge at a fair is a thankless one, and should be made as light and agreeable to honest men as possible. But the Executive Committee should avoid men who ask for appointment, or who are nominated by exhibitors in the classes they inspect.

Fig. 1.
Hitching Horses in the Stall.

There are horses that are as sober and staid while in the stall, as any one could desire, and which might be tied with a six-foot tie rope without ever getting a foot over it, and there are others which are ever restless, pawing and thrashing about, and making themselves very uneasy about something. These are frequently getting themselves and their masters into trouble in one way and another, and very frequently by getting one of their fore-legs caught over the halter strap. A correspondent, using the friendly signature of "A Quaker," sends us the following, showing forth

Fig. 2. his experience in this matter, together with illustrative drawings, which the artist and engraver have somewhat improved upon:

"Having seen and experienced much trouble

with horses getting their fore-feet over the halter strap, I employ a simple remedy. The tie-line is of rope instead of leather, with the end well whipped (wound with twine, to prevent the strands untwisting). This is passed through the hole and a figure-eight knot made a little distance from the end; the hole in the manger being made smooth, and slanting up and down; the rope runs freely in and out, just as the horse moves his head, thereby leaving no "bight" or bend to hang down. This prevents any possibility of the horses' leg being caught over it; which before was a frequent occurrence. Not only did it take time and trouble to extricate him; but there was also the liability of breaking the halter, and endangering his limbs. Aside from the above, less time is lost in tying and untying, and there is no danger of the horse getting loose; having tried this plan nearly two years, I am convinced of its efficacy."

Fig. 1.—ICE PLOW.

Gathering the Ice.

In gathering the ice for filling the home ice-house, all the tools that are really necessary are an ax, a shovel, one or two pike-poles, a stone-boat, ox-sled, or wagon of some kind, and a few

Fig. 2.—ICE PLANE.

boards. With the shovel, the ice is cleared of snow and broken pieces frozen on; with the edge of a board for a guide, the ice is marked off into strips of the desirable width, say 2, 2½ or 3 feet wide, using any iron point to scratch with. Then with the ax, a long narrow gutter is cut so that a start can be made, and the lines marked off are deepened so that long, narrow cakes may be detached from the main field. These are then, or previously, measured off into cakes of uniform size, and then striking blows with the ax, at first gently, to start cracks, and finally splitting blows, they are divided up into cakes of a size to be handled. It requires some judgment to get the best sized cakes, for they must be as large as can be handled easily, and yet be of a size to pack evenly in the house. Much, of course, depends upon the thickness. When the cakes are separated, the next thing is to get them out of the water. This may be done either by making "ways" or skids of boards, of about the width of the cakes. This should consist of 2 or 3 bottom boards and 2 side strips fastened together by cross-ties or cleats upon the bottom. It is shoved partly into the water, the cakes one after another floated over its sub-

Fig. 3.

merged end, and then shoved out by pike poles. The same thing is used to load with subsequently. It is best to set the ice on edge and leave it until the next morning early, when the temperature of the air is the lowest; for then ice is as dry as wood, and not only those who handle it do not get wet, but it is much better for the ice to be packed at a low temperature. If the whole of the ice could be packed at zero, the probability is that no thawing would take place for months. Hard wood wedges are sometimes useful in making the long strips of ice first cut, split off evenly. Several of these are driven into holes started by the ax on the line, and tapped smartly, one after the other. The hand ice saw, fig. 3, is very useful in gathering ice in a small way even. It is simply run through a hole in the ice, and operated by a man standing. The cakes cut with it in both directions are as true and even as possible.

If much ice is to be gathered, other tools expedite matters greatly. Then, ice gatherers can not choose what time of the day to do their work, and they must handle the ice cakes when wet and dripping, as well as when cold and dry. Instead of lining off the field ice with axes, after the first scratch is made as a guide, the ice plow is used. This instrument works on the principle of a dozen narrow planes in a line, each cutting its way a little deeper, and so making, in once or twice passing, a groove so deep that a crack will follow it when once started. Attached to this is a guide which will run in one furrow and guide the plow in making the next. To free the ice from snow, and broken pieces, making the surface uneven, or from soft bubbly ice, an ice plane (fig. 2) is used. It consists of plate iron guides in a frame, and a blade which may be raised or lowered, crossing at right angles near the middle between the guides. This is little used in this country, the common road scraper being employed, before the plow is used, to throw the snow into ridges, and to scrape it off into the water, or out of the way. The strips are cut up into accurately equal-sized cakes by the hand saw, or better by running the plow at right angles to its former furrows. This divides the ice into perfectly square cakes. Splitting is accomplished by the broad-ended iron bar, fig. 4, called the splitting bar. The pike poles are much employed, and in cases where the ice-houses are close by the shore of the lake or river, canals are cut through the ice so that the cakes may be floated close to shore, and upon the long tresseled ways up which the cakes are slid by horse-power, either upon cars or sliding directly upon the ways.

Tongs for lifting ice cakes are shown in D, fig. 4, and fig. 5, and are of different sizes, some

Fig. 4.—A, ICE AX; B, SPLITTING BAR; C, PIKE; D, HAND TONGS.

intended simply for use in the hands, or for horse-power, where large cakes or two at a time are drawn up into the tops of the ice-houses. The approved style of ax is shown in fig. 4, A. B is a splitting bar for use on the pond or in the house, and C is a convenient form of pike pole. With these implements adapted especially to the purpose, the work goes on very rapidly. They may be obtained in all the cities we believe. The drawings were made from the tools of R. H. Allen & Co., 189 Water-st., New York.

Agricultural Schools.

[This subject is one attracting the serious attention of many good men in our country, and the following article is from a valued correspondent. In one particular, at least, he is surely wrong, namely, in supposing that several hours of work will interfere with the most efficient study. We will state as one incontrovertible proof, that at the Michigan Agricultural College the boys all work three hours a day, and those who are reported by the farmer as the best in the field, are uniformly the best scholars.—Ed.]

It is a noteworthy fact, that agricultural colleges and schools, as thus far organized and conducted in this country, have, with a single exception perhaps, proved practical failures. Students in law schools become lawyers, medical students become physicians, and so on, but the students in our agricultural schools do not distinguish themselves as farmers, and time enough has passed for them to have done so if they would. How is this to be accounted for? We may not be able fully to explain it, but may point out some of the defects in the plans of the institutions thus far established.

It is a mistake to make an agricultural school a school also for general education. Our common schools and academies teach the rudiments of geography, grammar, arithmetic, etc.; why burden an agricultural school with these elementary and common branches? They cannot teach them any better or more economically than it is now already done elsewhere, and it only wastes time and clogs the working of the professional school to bring them into their courses of study. It not only takes up the time which should be devoted to studies strictly professional, but it lowers the standard of attainment. It tends to make a young man's education superficial, and hurries him into practical life at too early an age. The growing tendency in our country to shorten the period devoted to education, is hurtful, and should be resisted. As the country grows older, the tendency should be in the other direction.

Again, it is a mistake to connect the study of agriculture with a regular classical college, and make it a part of a course of general and classical education. This would tend to divert the mind too much from the regular studies. If a young man who intends to be a doctor, should have the science of medicine taught him in the midst of his college course, he would be very apt to neglect the other studies and give his chief thoughts to medicine. It might, in some cases, be wise to have an agricultural school in the same town with the classical college, but they should be separate institutions. In this respect, they should be organized just as our existing schools of medicine, law, theology, and practical science are—separate and independent.

It is a mistake, also, to make an agricultural school a manual labor school. The student in any and every department of knowledge should have daily exercise in the open air, for the pre-

Fig. 5.—HORSE TONGS.

servation of his health. But his exercise should partake of the nature of recreation, not labor. No man can well carry on two kinds of work at once: it may be either brain-work or muscle-work, but not both in the same day. If he toils with hands the largest part of each day, his reading, during his hours of rest, should not be of the nature of study. If he toils with his head the largest part of every day, he should, for the remainder, seek some kind of diversion, amusement, not additional labor of any sort. For all kinds of labor exhaust vitality. "All work and no play makes Jack a dull boy."

An agricultural school should differ from other institutions, in that it should be established on a farm. This farm should, if practicable, present a great variety of soils, also upland, lowland, woodland. It should have all needful buildings for stock, hay and grain, a well furnished chemical laboratory, the departments of Natural Philosophy, Natural History, etc., well provided with apparatus, and collections, a well stocked library, a gymnasium, etc. The farm, and its buildings and implements, and all other needful apparatus, should not be for the student to *work* upon and with, to any great extent, but rather to afford him ample means for study. He should work enough to learn how to handle tools and implements, and to know how to perform all kinds of farm-labor.

The school should have two courses of study: the one for a year and-a-half or two years, and another for three years. The first should be designed for those who are unable or disinclined to prosecute any but the elements of agricultural science; the second for those who wish to become thoroughly educated. The conditions of membership should involve only a thorough common school education. The course of study should embrace such branches as Botany, Vegetable Chemistry, Natural Philosophy, Mechanics, Vegetable and Animal Physiology, Mineralogy and Geology, Surveying, Farriery, Principles of Stock Breeding, Culture of Fruits, Draining, Elementary Law, etc., but which should be taught in recitation, by lectures, and text-books, and illustrated by experiments in the laboratory and on the farm.

This course of study, the long or short, should be considered as only preparatory to study in the great school of experience. Actual farming on one's own land will illustrate and confirm what has been taught in an elementary way in the agricultural school.

A Word for Mules.

We are glad to see that the use of mules for all kinds of hard, rough work, is steadily gaining ground. These animals are not beautiful or musical, but they are useful and economical. They are fit for work younger than the horse, since they are put to service at three years old, though they do not reach their maturity until seven years of age. Their temper, health, and usefulness, depend very much on the manner of breaking them. The so-called stubbornness and obstinacy of this animal arises chiefly from the abuse he is wont to receive when young. He seldom if ever bites or kicks those who treat him kindly. But the fact is, that the club and whip and whip-handle and boot-toe are applied to him without mercy; and yet he is expected to be always as patient and gentle as a cow!

The mule will do more work, and require less grain than a horse; he is less liable to disease, and recovers from sickness and injury quicker than a horse. He works better when old, and

holds out longer. He seldom takes fright, or runs away. He does not like overurging when drawing heavy loads, and he should never be driven very fast. In making up spans (those of 15 to 15½ hands high make most servicable teams), those of similar dispositions should be chosen and put together, so that they will work together pleasantly and with a will. The mule seems made for work—he thrives under it, and is better in spirits and temper than when idle.

Experiments in Raising Potatoes.

"Delaware" makes the following communication: "Last spring I tried an experiment in raising potatoes from whole tubers, halves, and single eyes, planting three rows of "White Sprouts," one with each, and marked a section of thirty feet in each row, near the middle, for testing. I planted 5 lbs. of whole potatoes, 12 inches apart—yielded 18 lbs. In the next row, 5 lbs. of halves, six inches apart—yielded 20 lbs., while 1 lb. 12 oz. of single eye pieces produced 10 lbs. There was no discoverable difference in the quality of the potatoes, and very little in the size. Those of the whole tubers were a shade the largest. This makes it appear that in economy of seed, the advantage is largely in favor of single eyes; for in the same proportion, the whole and half potatoes should each have yielded 28.57 lbs., instead of 18 and 20 lbs. respectively. Having reference to the ground occupied, the result is in favor of the halves first, and the whole potatoes second. The halves yielded double, and the whole ones nearly double what the single eyes yielded on the same surface of ground. Observe that, although the quantity of seed and the ground planted with whole and with half potatoes were the same, yet the distance apart was double in the first mentioned."

Milk for N. Y. City—Striking Figures.

This City is supplied with milk brought in over eight or nine railroads, and by wagons from many points in the immediate vicinity. The largest supplies come over three railroads, which during the ten months ending Nov. 1st, delivered the following supplies: Erie Railroad, 17,228,985 quarts; Harlem Railroad, 15,406,605 quarts; Hudson River Railroad, 13,007,810 quarts: Total, **45,643,400 Quarts!**—equal to 150,143 quarts per day, Sundays included. If we add as much more for milk from all other sources, condensed milk, etc., which is far too great an estimate, the supply would amount to 300,000 quarts per day. But this quantity is divided among the permanent and transient residents of New York, Brooklyn, Jersey City, Newark, and a dozen suburban cities and towns, as Hoboken, Hudson City, etc.—amounting in all to little if any short of two millions of people. The consumption therefore is *less than one-third of a pint per day to each person*. It is evident therefore, that there is still opportunity to largely increase the supply of milk without overstocking the market, even if there were to be no increase in population.... Taking the average retail price at 10c. per quart, the citizens paid for the milk brought on over the three principal railroads, over 4½ million dollars, of which the producers received about \$2,300,000, the Railroads \$800,000 for freight, and the wholesale and retail dealers \$1,400,000. These are general estimates, based upon the facts as nearly as they can be ascertained.... This 45,643,400

quarts of milk (brought over the three Railroads) would fill one million one hundred and twenty-five thousand ten-gallon cans!..... Reckoning this milk at only wine measure, it would cover 35 acres one foot deep, or it would fill a tank covering an acre thirty-five feet deep! The reader can readily extend the figures to the number of cows, the number of milk-men or milk-maids required, the feed consumed, etc., etc.

Middle Tennessee.

A correspondent, Mr. M. F. Averseiz, who refers to Dr. Hart, of Tullahoma, as willing to give particular information about this comparatively new part of the country, sends us the following letter. The land is broad, and many desirable locations are offered to enterprising settlers. Here is a plea for Tennessee:

"This beautiful country, especially the high table-lands in the Counties of Coffee, Warren, Grundy, and Marion, have many advantages, and are well worthy the attention of every one seeking a new home. The delightful climate, proverbially healthy, is very mild. The spring allows early plowing, sowing and planting. After April 1st, there is little or no danger from frost. In summer it is never too hot for out-door work, and the nights are always refreshing and cool, to such a degree that sleeping without cover is uncomfortable. The autumn is very pleasant, and the winter never severe; snow seldom lies longer than 3 or 4 days at a time, and ice rarely forms thicker than 3 or 4 inches. The land, a good deal of which, about 60 years ago, was a prairie, is now covered with White, Black, Spanish and Post Oak and Chestnuts, and near the streams Yellow Poplar, Black Walnut and Ash, having only little undergrowth, is easily cleared, and after this, on account of being level or slightly rolling, admits the use of all improved agricultural implements. The soil, although not so rich as the river bottoms, is a happy mixture of loam and sand, with a good subsoil, very easily worked, capable of holding a good deal of moisture, not liable to cake very susceptible, of lasting improvement by deep plowing, subsoiling, manuring, and a systematic natural rotation of crops. It is well adapted to the growth of all kinds of vegetables and grain. Wheat, rye, barley, oats and spring grains are sown in February. Corn, grass, clover, tobacco, flax, sorghum, yield enormously. Fruit of all kinds seldom fails; peaches grow large, and the trees last 40 years. Apples grow quite thriflily and bear well almost every year, also Cherries, Pears and Apricots. The Grape, though not yet grown extensively, is cultivated with success on the level land, and at a small cost, as thus the greatest part of deepening, loosening and cleaning the soil can be done by horse-power. Although not proper cotton land, yet this crop can be grown and pay well at present prices.

All circumstances combine to extend the farmer's work over the whole year, and as plowing can be done every month in the year, one man can put in and tend about twice as many acres of crops as at the North and West. The raising of horses, cattle, sheep, hogs and poultry, is very easy, and pays well; wild grasses abound; in the woods, a good mast of acorns falls almost every year, and only four months of winter feeding is needed—for sheep, only when snow covers the ground. Large springs of the best, purest, and healthiest water, abound in this region, and good water-power on different streams. The most remarkable of these water-powers is at Manchester, the county seat of Coffee County,

a neat village before the war, beautifully situated on the McMinnville Railroad, destined by nature to become a manufacturing city of great importance. Here the Duck River, a crystal clear stream, of considerable size, falls 150 feet in one mile, creating an immense propelling power. Such valuable advantages can not fail to attract the attention of capitalists eager for a well paying investment, as with water-power, all kinds of manufactured articles may be made with less expense than were steam power employed. Before the war, a Paper-Mill, Cotton Factory, Distillery, and Saw and Grist-mill were here erected, but the most of them were badly damaged during the war, when General Bragg made here 3,000 lbs. of powder per day.

The facilities for transportation to good markets are ample; good roads intersect the country everywhere. From Tullahoma, a Depot on the Nashville and Chattanooga Railroad, a Branch Road leads to McMinnville, which will soon be in running order again, and probably extended to Cincinnati; from Decherd, another Depot on the Nashville and Chattanooga Railroad, a Railway leads to the inexhaustible Coal Mines at Tracy City, where a coal-vein of five feet is worked, and lately a bed of Iron Ore has been found, and a Foundry is to be erected. The war has devastated this country badly, and deprived the inhabitants, a very clever, polite, affable, sociable, and hospitable people, of almost every thing but their land; they are very glad that they are back again in the Union, and very desirous that Northern men of enterprise should come and help to obliterate the ravages of the war, and to develop the resources of the country. Money is very scarce here, and thus most every land owner is willing to sell a part of his generally large estates at a reasonable price under favorable conditions. Wild lands are offered at from one to six dollars per acre, and partly improved farms at five to fifteen dollars per acre. At present, labor is cheap, white men work for \$1 to \$1.25 per day and board themselves, or for 50 to 75 cents and board; colored men can be hired for \$100 to \$125 per year and board, colored women from 50 to 75 dollars.

Although agriculture is here yet in its infancy, no improved implements to be found, as much as 25 bushels wheat per acre have been raised, and Cotton brings \$100 per acre. An apple orchard containing 60 acres, last year yielded 3,000 gallons of cider Brandy, and another orchard of 100 acres yielded to the owner, a year ago, \$15,000."

Apple Pomace.

Hundreds of tons of what, every farmer knows, would be good food, or at least good manure, if it could be used, go annually to waste, because nobody knows what to do with it. If spread as manure, it poisons the grass or crops, and it is hard to knock it to pieces. So it lies in heaps and rots slowly, and after a while, is used as chip manure would be.

Apple pomace may be worked over again, and fair vinegar made from it, but still the pomace or spent cider-cheese is left. It is remarkable that farmers never think of adding this ingredient to the messes they cook up for their hogs. The sour juice is nearly all pressed out, there is starch, pectin, gum, sugar, and much albuminous matter, besides the seeds, left—and it will require not more than 20 minutes boiling to cook it thoroughly. It would probably be palatable simply boiled, but the addition of potatoes, or any roots, with corn meal or oil meal,

would surely make it so. We regret that we are not situated so as to try the experiment carefully and report results, and hope very much that some of our readers will try it. We have no data to determine the average value of what is left of the apples, but have no doubt it is greater than that of turnips or even beets. So far as we see, it needs only to be cooked to become tender and palatable. We commend the subject to "Tuckahoe," who writes inquiring what to do with the article.

The Treatment of Tree Seeds.

Our people are at last waking up to the importance of trees, whether for fuel, timber, or shelter; indeed, so many have been the inquiries in regard to the subject, that we have offered a large premium (Oct. No.) to bring out the greatest amount of experience relating to it. The subject is already beginning to have a literature, as we last month noticed the "Forest Tree Cultivist" of Mr. Fuller. Upon looking over our correspondence we find a great many queries as to the proper method of treating particular tree seeds, and we can best answer these queries in a lump. These seeds may be divided into two classes, one including those that must be sown as soon as ripe, and the other those that with proper care may be kept until the following spring. Of those that are to be sown as soon as ripe, the Elm and the Red and White (or Silver) Maples ripen their seed in the spring. As we have shown in a former number, the failure with these seeds is due to want of knowledge of the fact that they ripen in June, and that they must be sown at that time. If kept until the following spring, these seeds lose their vitality and fail, but if sown as soon as mature, they make strong young plants the first year. Other seeds needing immediate sowing ripen in autumn, and these are to be treated as nearly as possible as nature treats them. If, late in autumn, we look beneath the fallen leaves of an oak tree, a plenty of acorns will be found from which the radicle has protruded, showing that germination has already commenced. This will give the hint as to the proper treatment of acorns, which are to be planted shallow and the bed protected with a good covering of leaves, or other mulch. Chestnuts, Horse Chestnuts and Buckeyes, Tulip Tree, Hickories and Walnuts are treated in the same way. Hickories and Walnuts are said to do well if kept mixed with earth in a cool cellar during winter, and we have succeeded perfectly well with Horse Chestnuts put in a box of earth and exposed to the weather all winter.

Seeds that are kept over winter should be preserved at a low and even temperature, and of course be quite dry before they are put away, to prevent mould. The following are among the commonly planted seeds that are usually to be had of seed dealers: Honey Locust, Osage Orange, the Ashes, Larch, Deciduous Cypress, Maples (except Red and White), Spruces, Pines and other evergreens. Honey Locust, if fresh, will grow without preparation, but if old, it should be scalded. Osage Orange must be sprouted; the others merely need to be sown in a light rich soil. Evergreens are very tender when young, and are apt to be sun-scalded. These are best sown in beds where they can be shaded by a lattice work screen made of laths.

Young trees, like other young plants, require care, and no one need sow the seeds with the expectation that they will take care of themselves. Weeding, cultivation, and thinning must

be duly attended to, and if the little trees are likely to suffer from drouth, the ground should be covered with a good mulch of saw-dust. If they are left in the seed-bed over the first winter, they will need to be covered with leaves.

American Wines.

Those who have only seen the sugared liquids often presented as wines, can have no idea of the wine producing capabilities of our native grapes; and very few are aware of the large amount of capital already invested in wine making, or of the excellent quality of the wines produced at first class establishments. At Hammondsport, N. Y., the Pleasant Valley Wine Company, the oldest in that vicinity, has already established a reputation for its Still and Sparkling Catawba, and other wines, and it proposes to compete, in the way of sparkling wines, with the products of the French vineyards, at the Paris Exposition. The Urbana Wine Co., at the same place, though not yet fully in operation, has the capital and means to carry on the business on an extensive scale. At the exhibition of the Lake Shore Grape Grower's Association, we saw about a hundred samples wine, some of them from well known makers, and others from those of less reputation. The character of these wines was of a high average, and some samples remarkably fine. Aside from the well-known Catawba and Delaware, the first prizes for which were taken by W. P. Anderson & Co., Cincinnati, there were some kinds not often seen. A specimen of Clinton showed that the wine making capabilities of this grape have been overlooked. This, and a creditable sample of Concord, were shown by the Lake Shore Wine Co., Brocton, N. Y., and took a well deserved premium. Norton's Virginia, of which but little is known at the East, gives a dark red wine, of a peculiar flavor that is usually unpleasant to those who are unaccustomed to it, but it is highly esteemed by many. W. P. Anderson & Co. took the premium in this class. The wine which deservedly attracted the most attention, both on account of its rarity and fine quality, was that from Ives' Seedling, exhibited by J. M. McCullough, Cincinnati. It is a red wine, somewhat like Burgundy, and gives promise that we shall not long depend on foreign countries for a supply of wines of this character. Many other noteworthy samples were exhibited which we should be glad to speak of, if we had space. In the discussions of the convention, very strong grounds were taken against the addition of anything—even grape sugar—to grape juice in order to make wine. It is probable that the many plantations of Iona will in the coming season be in bearing, and this variety be sufficiently abundant to allow it to be made into wine in a quantity large enough to give it a fair trial. From a sample made in a small way, as well as tests, we have seen of the must, something remarkable may be looked for.

VARIETATED EVERGREENS are becoming quite numerous; among the recent ones are a silver leaved variety of *Cupressus Lawsoniana*; said to be very fine, and a variety of *Sequoia gigantea* (Wellingtonia of the English), with yellow markings upon the leaves. The Golden Yew, a marked variety of the European Yew, is represented in this country by some fine specimens. In the spring nothing is more beautiful in the way of "foliage plants," than this shrub.

[COPYRIGHT SECURED.]

THE BULL STABLE.—FROM A PAINTING BY BRASCASSAT.—Engraved for the American Agriculturist.

Who has not stood at the door of a bull stable and looked in upon his Lordship, lazy and warm in his bed of straw, as we are supposed to see Monsieur Taureau here? The soft flank, the gnarly massive uck, the wrinkled, curly, hair-padded forehead, the stout, short horns, are all so natural and familiar that one almost expects him to sway himself up, and then hollow his back, and stretch, and snuff. In standing near or handling a bull we have always the same feeling we have in standing near a locomotive engine, or a steam boiler—that it is safe now, but a little indiscretion on our part might produce an explosion at any moment. There is a wonderful amount of power slumbering in both. The bull may be never so sleepy and quiet, it is not safe to give him a chance to show himself wide-awake and able to use his power. To this end, while still a calf, or just growing out of calf-ship, the bull should have a ring put in his nose, and be always led by it with a leading pole.

Notwithstanding the familiar look of the bull here pictured, it is not rash to say that his like was never seen in America. He is obviously of none of the British breeds: every point is continental. Of the Continental breeds we have in

this country, those which came from the north of France left their descendants chiefly in Canada. These somewhat resemble the cattle of the Channel Islands, (Alderneys, etc.) and are usually marked by the mealy muzzle, which this one has not. We have also the Dutch cattle, those of modern importation, having much better beef points than are here shown, and the descendants of the cows brought over by the early Dutch settlers, in which the black and white spots are sharply defined, and which, indeed, have something of this look, but are not so coarse as this fellow, handsome and picturesque though he is. With the Spanish cattle of the South, he bears no affiliation. We must look rather to the common stock of the Swiss border for the model which the artist had in mind, or before his eye, rather, for this is no fancy piece. We remember well to have seen animals very like him at the cattle shows, and in the farm-yards, and pastures of that French-German-Swiss region of the upper Rhine. The monstrous coarseness of the root of the tail, accompanying rather large head and great flabby dewlaps, is a marked feature of some of the large Swiss breeds. Their tails often stand

up several inches above the line of their backs. They are round buttocked too, and narrow above the hock. We present the picture, however, primarily as a beautiful and interesting work of art, and not as a model for the breeder.

The Imperial Dahlia.—(*Dahlia imperialis*.)

All the double Dahlias of our gardens, whether of the tall growing or dwarf sorts, though they number their varieties by hundreds, all belong to one species, *Dahlia variabilis*. This species is rightly called *variable*, as it has run into all the sports of color that we can conceive any one plant capable of. Besides this, there are some half-dozen other species cultivated in European collections, but as none of these seem disposed to make double flowers, they have not obtained popularity. We have been much interested in one of these rare species, cultivated this year by Mr. Henderson, the *Dahlia imperialis*. This, like the common one, is a native of Mexico, but has quite a different aspect from that. It is a very stately looking plant, with palish leaves that are more divided than those

of the ordinary plant. It produces an abundance of flowers, which, though single, are very beautiful. A small yellow disk is surrounded by a single row of rays, four inches long, which together form a sort of bell, and look much more like a lily than they do like a head of composite flowers. This lily-like appearance is heightened by these rays being pure white, except just at the base, where they are touched with a rich crimson. The engraving is about half size, and though it gives the general form of leaf and flower, it fails to convey the color, upon which the effect so much depends. In France, this is valued to plant out in the open ground of their winter gardens, where it attains an enormous size. As it requires a long season, it will be necessary to start it early and get a good growth before putting in the open ground.

The Cabbage in its Varieties.

In preparing the engravings for the work upon gardening, noticed in another article, we were particularly struck with the wonderful variety presented by the cabbage plant, *Brassica oleracea*. Perhaps no cultivated plant presents us with such a wide range of varieties, and certainly no one of our garden vegetables affords so many useful forms. In one or another shape it, as Beecher says of the apple, "belts the

stable food from some form of this useful plant. The original, or wild plant of the cabbage, is

formed into a more or less compact head. These are the richest of all cabbages, and so

distinct in appearance and flavor from the smoother and harder forms, that in the English gardens they are not called cabbages, but Savoy. For family use, though they do not grow so large as other cabbages, they are late and stand severe frosts. We then come to the cabbage proper, including early and late sorts, which present us with a great variety, from the loose Early York, to the enormous and compactly folded Drumheads (fig. 3). In the Cauliflower and Broccoli, which are very much alike, the leaves do not fold, but surround a center, which is a mass of fleshy flower stems and undeveloped flower buds, all so closely crowded together that their parts are not distinguishable (fig. 4). This when cooked is of almost melting tenderness, and may be considered thus far the crowning achievement of the remarkable *Brassica*, in the way of varieties. A curious variety is presented in the Brussels Sprouts, (fig. 5,) a vegetable not so much grown as it would be, were it known that it is easily raised in any garden soil, and that it is a most excellent vegetable. In this the stem grows tall, and instead of producing a head at

IMPERIAL DAHLIA.—(*Dahlia imperialis*.)

found on the coast of England, France, etc., and would hardly be recognized by those who have only known the garden forms. Its great tendency to change is shown in the first generation, as seeds of the wild plant will, if sown in rich soil, give plants varying much in their foliage and other peculiarities.

The nearest to the wild state of the plant is the Borecole, or Kale, (fig. 1,) which never makes a head, but only a cluster of loose leaves, in different sorts beautifully cut and curled, and often presenting fine colors: This is a very useful, but much neglected variety. It is quite hardy, and where the thermometer does not go much below zero, it will stand out without any protection.

After a freezing it is very tender and well flavored. In

the Savoy Cabbages (fig. 2) we have the leaves broader, still much curled and wrinkled, but

the top, it forms a great number of small heads, about the size of walnuts, along the stem. Still another variation is presented by the Kohlrabi, (fig. 6,) in which the leaf is rejected, but the

Fig. 2.—SAVOY CABBAGE.

stem, which swells out like a turnip, is the eatable portion. This, if taken early and before it becomes stringy, is esteemed by many. Then again we have an always acceptable vegetable

Fig. 1.—BORECOLE OR KALE.

year," for with a properly managed garden a family need be no time in the year without fresh veg-

Fig. 3.—DRUMHEAD CABBAGE.

in the form of "cabbage sprouts" or greens, obtained by setting out cabbage stumps in spring.

These are all the forms of the plant grown with us, but there are others more or less known. As illustrations of the manner in which a single plant may vary in cultivation, and be thus adapted to different seasons and uses, they are interesting and curious, but we had another object in view in presenting them; they include

plants little known beyond a certain few, that *should* be known and grown by all. In the majority of farmers' gardens, the late cabbage is the only one that finds a place. Here are six distinct sorts, each differing in flavor, and in season, all of which might, with no more

Fig. 4.—CAULIFLOWER.

care than is required for the common cabbage, be grown and thus add largely to the variety upon the table. Our city markets are supplied with cabbages in June, from plants that have been wintered over. The

seed is sown in September, and the young plants are set in cold frames where they pass the winter, and are transferred to the open ground in early spring. The cabbage is quite hardy, and more plants are lost by keeping the frames too closely covered, and thus weakening them, than there are by actual freezing.

Any one with a few sashes at command, can put together a rough frame of boards of the proper size for the sashes; he should set the

Fig. 5.—BRUSSELS SPROUTS.

young plants rather closely, down to their leaves, and have them well established before cold weather comes on. He can afterwards, by a little attention to airing, carry plants through the winter without any difficulty. Kohl-rabi does not transplant as readily as do the other varieties, and the safest way with this is, to sow it in drills where it is to stand, and afterwards thin to the required distance.

We have not room to treat at length of their cultivation now, but in our notes for the month these things are always noticed.

Fig. 6.—KOHLRABI.

Sports, as Affecting Fruits.

That plants will sport—that is, deviate from their ordinary ways, and produce leaves and flowers different in form and color from the ordinary—is a well known horticultural fact. It is also well known, that many of our varieties have been obtained by perpetuating these sports by cuttings; grafts, etc. Some of our variegated leaved Geraniums or Pelargoniums, and other plants with marked foliage, have been obtained in this way, and some of our fine Roses are sports from other varieties. That the quality of fruit may be affected by sporting is not so well established; yet some cases have come to our notice that look as if this were the case, and which we wish to put on record, with a view of calling out other and similar facts. At our grape exhibition, in 1863, a dish of Isabellas was presented, the berries in which were of a size so great that the judges decided that such fruit could only be produced by ringing the vines, and excluded the dish from competition. Since then the exhibitor has assured us that no ringing was practised, but that one part of the vine always bore just such fruit, while the other portion produced that of only ordinary size. Recently, Mr. Albert Granger, of Washington Heights, N. Y., brought us some bunches of grapes, for an opinion, which we gave to the effect that the fruit was an indifferent Isabella. The account that he gave of the fruit was so remarkable, that we requested him to make his statement in writing, which is as follows:

"In the spring of 1860, I procured 9 Catawba vines from Dr. Underhill, Croton Point. I set them all, they lived and thrived, and, in 1862-63, fruited, bearing Catawba grapes. In Nov., 1863, the trellis on which they grew was partially destroyed by fire (catching from a burning barn,) and one of the vines was burnt down to within one foot of the ground. I left the stump standing. In the spring of 1864 several buds appeared just above the ground; I let them all grow, and in the summer broke off all but two thrifty canes that sprung from opposite sides of the stump. These two canes grew well that year, and in 1865 the vine again bore Catawba grapes. This year it has borne very prolifically, and, as it had the best exposure of any of my vines, the fruit commenced changing two weeks earlier than on any other vine on the same trellis.

The beautiful tints of the berries—the semi-transparency so to speak—was matter of remark; but to my surprise the fruit soon lost that character of color, and changed to the color of an Isabella. When ripe, they were found not to possess a single characteristic of a Catawba, but are pronounced by all persons who have partaken of the fruit to be Isabella grapes, and so they appear and taste to me. There can be no question about the history of the vine, and the fact that it bore, in 1862-3-5 Catawba grapes; to this I would affirm."

From a long conversation with the writer of the above, we cannot see where he could have made any error in his observations, and that, as far as evidence can be relied on to establish an occurrence, the above must be accepted. Before this article was in type, we found in a foreign journal an observation bearing on this point by M. Carriere, the well-known horticulturist, of the *Jardin des Plantes*, Paris. "A Black Hamburgh was cut down, when it produced three suckers, one of which was layered, and after a time produced much smaller berries, ripening at least a fortnight sooner than the others. This phenomenon occurs every year. Of the remaining two suckers from the same stock, one gives every year fine grapes, while the other, although it sets abundance of fruit, only ripens a few, and these of inferior quality."

These facts appear to us to show that in some cases, vines at least do sport to an extent that essentially modifies the quality of the fruit, and that this helps us to understand how there may be so many vines with fruit, differing much in quality, all called Isabella. The subject is an interesting one, and one that has a practical bearing. It should induce propagators, at least those who grow vines, to be careful as to the sources whence they obtain the wood, from which they propagate stock for sale.

Western Apples—Grimes' Golden Pippin.

The number of new, or rather unpublished apples that turn up every year, is something

GRIMES' GOLDEN PIPPIN.

alarming to one who tries to keep the run of such matters. The Western States give us annually a batch of new sorts, that are slow in making their way eastward; indeed, there are so many peculiarly western varieties, that a large orchard might be stocked with a good assortment of choice kinds, not one of which a New England orchardist ever saw, if he ever heard of them. Of good apples, we have a sufficient number of varieties, and probably some of these

will never be excelled as far as quality is concerned, and could we only get the fruit of those, there would be but little temptation to look after others. However this accumulation of varieties may bother the pomologist, one good result from it; it allows more attention to be paid to the character of the tree, than if the lists were limited. A new variety, the tree of which is hardy when young, comes into bearing early, and bears regularly, must supplant an old sort, no matter if the fruit is a little better, provided the tree lacks these desirable qualities. This is just what our Western friends are doing, with their abundance of material—studying the qualities of the trees as to hardiness and healthfulness, as well as those of their fruit.

Doct. J. A. Warder, of Ohio, in making up some notes on new apples for the *Horticultural Annual for 1867*, refers to the Grimes' Golden Pippin as one of the varieties that are remarkable for the characters of the tree as well as those of the fruit. Specimens did not reach us in time to illustrate this, with the others, for the *Annual*, but we have since received specimens from S. B. Marshall, Massillon, O., which enable us to give an outline of the fruit, to which we append an account abridged from the more extended one furnished by Doct. Warder.

The original tree stands in Brooks Co., West Virginia, not far from the Ohio River; it was known to the boatmen in 1804, and is still in vigorous fruiting, having borne about twelve barrels the past season, all perfect and smooth. Orchard trees of this variety in Smithfield Co., O., have not failed to produce a crop for the past eighteen years. Mr. Marshall, who sent us the specimens, writes that it the hardest tree in his nursery; that the branches neither split nor break, and that it is a regular and uniform bearer, being never affected by the severest winters. We append a description and note by Doct. Warder, with the remark that, while our Western friends are responsible for the statements about the tree, we are able to corroborate all they have said about the superior quality and richness of the fruit:

"Tree, hardy, vigorous, healthy, productive; branches, strong, spreading, shoots stout, dark; foliage, healthy, dark green; fruit, medium, globular, cylindrical, regularly or slightly angular; surface, smooth, yellow, bronzy or slighted russeted; dots, numerous, minute, yellow; basin, abrupt, deep, folded; eye, large, generally open; cavity, wide, regular, green; stem, long, slender, curved; core, small, closed, meeting the eye; seeds, numerous, angular, brown; flesh, yellow, breaking, very fine-grained, quite juicy; flavor, sub-acid, aromatic, rich. Use, table, its size being very convenient, and kitchen. Season, December or March. Quality, best.

"This delicious winter keeping apple should be extensively disseminated by nurserymen, who will find nothing to complain of in its habit in the nursery, while the planter will be gratified by a noble and productive tree, that comes early into bearing, and annually furnishes him choice fruit that rivals the Newtown Pippin in its good qualities. Indeed this variety may well be recommended as a substitute for that old favorite in regions where that does not succeed. In its peculiarities of richness and

flavor, however, it more nearly resembles that charming amateur fruit, the Newark Pippin, which is unfortunately little known in the markets, though it is quite an old variety."

Fig. 1.—BEURRE GRIS D'HIVER.

A Couple of Old, but Little Known, Pears.

A good pear is a good thing; but what is a good pear? The select lists of the amateur pomologist are not the lists of the fruit dealer, and nurseryman. We have a democratic way in our pomology as well as in our politics, and vote for or against things without regard to presidents or precedents. Pomologists say that

marks upon thinking how many really good pears there were, in comparison with those that found their way to the markets. One reason perhaps is, that we have been too hasty in our judgments, and have condemned many worthy varieties before they had time to show what they could do. At all events there are many old sorts that have been overshadowed by newer comers, which have been quietly gaining strength year by year, and though they do not find a place in the "select lists" of fruits, are well known, to those who have been patient with them, to be of the greatest excellence. Among the late varieties that are likely to be held higher in popular favor than they have yet been, are the two of which we present figures.

BEURRE GRIS D'HIVER.—This is a French pear, and is given in some of their works as *Beurré de Luçon*; first known in 1839. The tree is a very vigorous grower and does much better on pear than it does upon quince roots. The size and shape are sufficiently well given in the engraving. The skin russet, with sometimes a ruddy cheek in the sun. The flesh is melting, juicy and vinous. Quality, best. An early winter pear that keeps through December. Mr. Barry informs us that it brings the highest price.

JOSEPHINE DE MALINES.—A Belgian variety made known about 1830. The tree is hardy, but only a moderate grower, and does not give its best fruit until it has acquired age, but when sufficiently old, is very productive. The fruit is yellowish green, sprinkled with russet. Flesh slightly rose tinted, melting, sweet, vinous, and agreeably perfumed. Keeps until January, and with care will last even into March. It is justly regarded as one of the best winter varieties.

There are several other varieties now in unmerited neglect, that we hope to bring to the notice of our readers. More attention should be given to late varieties, both for market and home consumption. Well kept late varieties bring astonishing prices; while at home, nothing can be more refreshing as a dessert fruit, than a properly ripened, melting winter pear.

"Gardening for Profit" * — Small Places near Towns and Villages.

The regular "salt" used only to ocean sailing, looks with great contempt upon the short waves of our inland lakes; yet we always attained the result, if not the real object, of sailing—sickness—sooner on the fresh wave than on the briny one. So farmers of five hundred or a thousand acres would see ruin before them were they told they could have only ten. Yet many do get comparatively rich off of ten acres, and some who have only five, pocket more money in a year than those who have five hundred. But there is this to be borne in mind, that these small places must be near a market, the land must be good, and kept up to the very top of fertility, its occupant must work hard, and he must *know how*. This knowing how is perhaps the hardest of the conditions, but we have cornered one of our most successful market gardeners until he has recorded his eighteen years' experience.

* Gardening for Profit, by Peter Henderson, South Bergen, N. J. New York: Orange Judd & Co. \$

Fig. 2.—JOSEPHINE DE MALINES.

the Bartlett is a third rate, or, at best, a second rate pear; the people say that the Bartlett is the pear for their money, and the nurseryman is obliged to grow the trees, and the orchardist produce the fruit. We were led to the above re-

rience in a book, the title of which is given above.—Mr. H. writes pointedly, gives the “tricks of the trade,” so to speak, without any reservation, tells his failures as well as his successes, makes a book that is the best guide, short of actual experience, and has the rare merit of stopping when he has nothing more to say. To be successful in market gardening, besides the requisites above mentioned, there must be a sufficient capital to employ all the necessary working force, and procure the required amount of manure and other appliances. Every mile from market lessens the profits, and every mile nearer the market increases the value of the land. Every foot is made to pay, and two and often three crops are taken from the same ground each year. Thus: In spring the land is planted to early cabbages, with lettuce between the cabbages; the lettuce comes off before it is in the way of the cabbages, which, after they have matured, are followed by celery or other late crops. In this way, by various combinations and rotations, the land is kept always at work. Though the leading object of this work is to furnish a hand-book on market garden, yet the private garden is not overlooked, and the cultivator

“for profit,” whether he gets it in consuming or marketing his produce, will find it of great value. One commendable feature in the work is, that the author confines the lists of varieties to the few that he considers best; suitable illustrations are given where needed, and the chapters upon frames and houses for forcing vegetables will meet a long felt want.

Those who have places near towns and villages will generally find it profitable to raise garden crops. Even if there is no regular market, we know from experience that a demand is easily made, and we have no doubt that in all large villages and towns, vegetables a little earlier or better than usual, will meet with a ready and remunerative sale. The raising of plants under glass can be made to pay in almost every thickly populated community, as people are willing to pay a good price for tomato, cabbage, pepper and other plants. Mr. Henderson's work gives ample directions for raising these, as well as for wintering cabbage and other plants for sale, or for setting in the spring.

A NEW VARIETY OF THE PAMPAS GRASS (*Gynerium*) has been raised in the Paris Garden. Instead of the silvery white panicles of the ordinary form, it has its flower clusters of a rich purple color. It will probably be a long time before this becomes generally distributed, but it will form a marked contrast with the original

plant. A striped leaved variety is also among the newer plants. This, by the way, is a most stately ornamental plant, and should be more common than it is. It may be kept by placing the roots in a cellar for the winter. Around New York it passes the winter safely if covered with a box or cask, then filled in with leaves.

ASTILBE JAPONICA.

A Valuable Herbaceous Plant.

(*Astilbe Japonica*—not *Spiraea Japonica*.)

Under the incorrect name of *Spiraea Japonica* we have for years grown a plant that we knew could not be a *Spiraea*, but neglected until last summer to look up its true name. It is curious, as well as provoking, to see how an incorrect name will stick, after it once gets into the catalogues. A remarkable instance of this is *Dicentra*, which the best of florists will call *Dielytra*, a name that first came into use through a misprint, and the above plant is an illustration of how the botanists sometimes keep a name unsettled. As many who are not botanists are puzzled at the way in which names are confused and changed, we will briefly state what happened to this. As the plant is in general appearance like some *Spiræas*, it was without sufficient care, called *Spiraea Japonica*. After the French botanists found out it was not a *Spiraea*, they called it *Hoteia*, making a new genus in 1836, and naming it after a Japanese botanist—for they have botanists, after their way, in Japan—named Ho-Tei. When Hooker and Bentham came to overhaul genera for their great work, they found our plant did not need a new genus at all, but would fit very well in the old genus *Astilbe*, published some thirty years before, and here it will doubtless rest.

But to get back to our plant, of which our engraving shows some flowering stems, with their leaves, of the natural size. The radical leaves are like those which are represented, but much larger, and as they form a dense tuft of dark green, shining, and handsomely cut foliage, the plant itself would be worth growing, even if it did not bloom. In June it throws up stems about 18 inches in height, which bear spikes of very small flowers of the purest white, and when these are set off by the unusually dark and somewhat fern-like foliage, the plant has an aspect of delicacy and neatness that is most pleasing. The flowers of the *Astilbe* are among the few of those of our herbaceous perennials that are sufficiently refined in their character to use in a bouquet, and for this purpose they are always in demand among florists. The leaves are also a serviceable green in large bouquets. *Astilbe* is perfectly hardy, grows rapidly, and multiplies readily by division of the clumps after flowering is over; it likes a good soil, and does rather better if in a partially shaded place. This is an excellent plant to force for green-house decoration in winter, and it is one of the many forced perennial herbaceous plants sold in our flower markets

in spring. Though in the nurseries and in works on floriculture the plant is classed under the herbaceous *Spiræas*, under its old name of *Spiraea Japonica*, it does not belong in the same family, but to the Saxifrage Family. It is catalogued by the principal nurserymen at 25 cts. a plant. A beautiful variety, with the leaves elegantly veined with golden yellow, was sent from Japan by Mr. Hogg; it is yet quite scarce.

MARKET GARDENING IN PARIS.—At the “Great Exposition” to be held in Paris the present year, market gardening will be a prominent horticultural feature. A portion of the grounds is appropriated to the use, under the direction of a committee of the most celebrated market gardeners near Paris. It is proposed to have a model garden to illustrate all the processes of cultivation employed in supplying Paris with its *legumes*, or, as a Jersey-man would say, “garden truck.” Extensive programmes are put forth for displays in other departments of horticulture, but we see nothing at once so novel and so useful as this.

VIOLETS IN ENGLAND.—Violets are attracting much attention in England just now; several new varieties are offered, and some old and lately neglected ones have suddenly become popular. We hope our florists will have a Violet fever.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

The Housekeeping "Prize Articles."

We are in trouble about these, as the reader will see.—Every other department of human labor has been freely written about, in books and periodicals; a few recipe cook books, and occasional newspaper items, embrace most that has been printed about Household work and cares. After a dozen years of oft-repeated invitations, we began to fear our good Marthas either could not do it, or that they would not be induced to pen down their own experiences for the benefit of others. So, in November, we threw out a positive challenge in the form of a \$100 Greenback, hoping somebody would accept the banter. Well, it has been done, and by nearly four-score of our fair readers—and to our utter overwhelm! Seventy-six fair competitors! and from almost every State in the Union, we are told, though we are in utter ignorance of the name or residence of any one of the writers, and have our curiosity tantalized to the highest pitch, for one of the Publishers took the Essays in charge as they came in, numbered them in the order of reception, privately recorded the address of the writers, and only handed the Essays themselves to us Editors ("the Bachelor" included). We look over the beautifully written manuscripts, one after another, and wonder who wrote this one and that one, but the only response is "No. 1," "No. 5," "No. 14," "No. 26," "No. 34," "No. 43," "No. 56," "No. 71," as the case may be. We beg Mr. Chase to just tell us who wrote this very beautiful one. But he answers "No: decide upon the merits of the Essays themselves, and not of the writer. They are all supposed to be written by married housekeepers"—which of course we (especially "the Bachelor") don't like to believe. As we look on this vast collection of more than two thousand pages of manuscript, and think of the labor and toil and time and thought, they have cost, we would regret having thrown out the challenge, were we not sure that great general good will come of it. Our own appreciation of the amount of thought, skill, and patience, and the degree of domestic talent to be found among Housekeepers, is greatly heightened, and we shall strive anew to secure a higher appreciation on the part of others. We are carefully considering how this mass of information can be turned to good account for others, and in some degree to the benefit of, at least, a part of the writers.

But what about the selection of the Prize Essay? Of course, we men-folks can not do that. Well, Dec. 1st these numbered Essays were handed over to a Committee of intelligent Housekeepers, in good repute for their practical acquaintance with every day work. They have been busy reading for nearly two weeks! and have only got to No. 65. They read each Essay carefully through, make notes upon it, and mark it "A," "B" or "C." They report that nearly one-third are marked "A," and that to go over and over these, and reduce the choice to one, will require the work and consideration of many days, if not weeks, yet. It is therefore impossible to announce the award, this month, or begin the publication of the Prize Article, or articles if more than one is selected.—While waiting, we will give a few extracts, taken at random, from some of the Essays. As so small a portion of

each is taken, these extracts will not at all affect the value of any one for future use in this paper, or elsewhere. The numbers merely indicate the order in which the Essays came in. We have not the slightest idea of the name of any writer.—Eds.]

Extracts from Prize Essays.

[From No. 41].—"...We had always two wells, one in the yard, the other in the cellar, and used either at pleasure. It was long after the house was rebuilt, that a pleasant innovation came in the shape of a pump. The relief from carrying water up stairs is very great. We are not a demonstrative family, but we felt that our water-pail had fallen in more pleasant places, if we did not tell of it. From an over-sight at the first, in the location of our kitchen, we had compelled upon ourselves 720 miles travel in the fifteen years, for the one item of water. Without a cent more expense at first, we might have so arranged that we could have pumped water and poured it into the kettle on the stove, the dish-pan in the sink beneath, or the hand-basin in an adjoining sink,

in every thing else, very clever with me. He built a box, just large enough for the pail to set in, and covered it with a lid on leather hinges, and set this box in one corner of the wood-house, just by the kitchen door... John brought home fifty pounds of beef last week, and I concluded to 'corn' it. My way is this: I have it cut into pieces of five or six pounds, and rub each piece with sugar, two pounds will do for 100 lbs. of meat; then pack tightly in the barrel; take sufficient rain water to corn well. To every 100 lbs. of meat, take 10 pounds salt, 4 ounces salt-petre, and 2 gallons molasses; put these in about half the water, and heat until the scum rises, skim, stirring meanwhile to dissolve the ingredients, then mix with the rest of the water, and when cold, pour over the beef. This is the base of an Eastern 'Boiled Dinner'...."

[From No. 15].—"...A house in the country is not a house merely, 'to keep and to dress.' It is a garden, a farm—a little realm complete in itself—and a woman's presence should be felt throughout—especially in the arranging and ornamenting the grounds adjoining the house, should

her taste be apparent. And first of all, it is desirable to produce a harmonious effect, so that regarding the home from without or from within, each object shall appear to be a part of a beautiful whole. Then, be the design simple or elaborate, it matters not, provided the home be an exponent of the owner's tastes and means.... We chose our home because of its proximity to Institutions we love, and not, as may fairly be presumed, for the beauty of its location.—We built our house in an open field, on a rise of ground made by grading, but which now often elicits the remark, 'How fortunate you were in finding such a pretty building spot,'—the observer little dreaming that our cellar bottom is a part of the original surface. There being no previous improvements to modify our plans, we gave the public road a wide berth, and immediately set about shutting it from view, by setting forest trees along our whole front, and on either side of the carriage way. An amusing conversation occurred between the original owner of our fields, and my husband, Mr. Max, while thus engaged. To give the story point, it must be premised that this stickler for 'fruit,' had scarcely managed in the course of twenty years to cover his house lot with enough trees to supply his family with apples.—'See here, neighbor,' said he, 'What kind o' fruit do you expect them are trees to bear.'—'They would have borne dollars for you, had you set them here twenty years since,' was the rather tart reply, for the bare and desolate appearance of our fields was a serious drawback to our happiness that first year. Well! the trees have already borne—not dollars nor apples—but the pleasant assurance to us, that our home is growing in beauty every year. Next, grass was desirable, thick, soft and velvety. Thanks to our peculiar soil, we soon had this to our liking; and it is not weedy and rough, if it is sometimes high enough for meadow. A few evergreens scattered here and there was

A STUDY IN PHYSIOGNOMY.

Our Artist has been amusing himself, as children sometimes do, by "making up faces," and has succeeded so well, we think our readers will be pleased to examine his production. An interesting part of the performance is, that one feature is in many instances, made to do double duty, presenting the singular fact of several persons having but one nose, one pair of eyes, etc., among them. The picture was intended for the Boys and Girls' Department, but other matters fully occupied that space, and probably their mothers will not object to a little "spice" in their own part of the paper.

without taking a single step..... Our table arrangements are equally incomplete. A dish-closet adjoining the dish-sink, and in convenient proximity to the table, would leave the circuit from closet to table, from table to sink, and from sink to closet again, a matter of less steps in a week than we now find necessary for one meal. As it is, we traverse an average of 160 feet in simply bringing the dishes for each meal. Returning them to their places involves a distance of 240 more. This foots up in the little annual journey to our commissary, 103 miles! Counting our fifteen years' blunder, it amounts to 1,553 miles! and this not for the meals only—the 720 miles for water, and 1,553 for dishes, giving a total of 2,273 miles! and the time absorbed in this long pedestrian journey might have been absolute leisure, and the work have been as well performed. A review of all our mistakes might not prove interesting. We made a dozen or so, each having an unfortunate effect on our domestic enjoyment...." [How many thousands of families are doing the same to-day?—Ed.]

[From No. 3].—"...It is the little things of this life that annoy a body; my annoyance is (I'm ashamed to confess,) no larger than the 'swill pail.' It is a 'necessary nuisance,' always needed, yet always in the way—an unsightly object to man or woman-kind. John acted in this, as

all we attempted further, that spring, for showy parterres and graveled walks were not to be thought of. Trees will grow while we are at work or asleep, or enjoying our noonday rest. Many hardy climbers, roses, and ornamental shrubs, will do the same, and thank us for the privilege. We will put out a few of these each spring and autumn—no more than we can take good care of—and in time we shall be satisfied.... Such was our conclusion, and steadily we have worked upon it. The care of the grounds has been our recreation.... Our winter sitting-room opens to the south; the smoothly shorn lawn, and a variety of shapeful evergreens are in view from here, so that no sense of desolation mars the prospect. The rooms that open to the north and east, are our principal summer resort. Opposite these I grow my showy annuals and bed my petted exotics. The breath of the Sweet Briar, Lilac, Missouri Currant, and innumerable roses in their season, floats in at our open window. There are always flowers for as many bouquets as I like, from early spring until the Chrysanthemums are frozen, and yet we spend but very little time among them? How can we when we do not have it to spend?...."

[From No. 49].—"...I am fully convinced that there are not only many men of many minds, but many women

also. In talking of renewing fine shirts, quite an item in these days, Mrs. Thoru says when the edge of a bosom begins to wear, she makes a delicate button-hole stitch the length of the bosom, works over the button-holes carefully as soon as they give way, patches the cuffs which never show it, and in this way she makes a shirt last one-third longer than she once did. Mrs. May, who owns a sewing-machine, and seems to think there is sport in making button-holes, stitches a strip of linen to match the middle fold, cuts out the old one with its worn button-holes and (having allowed for it in cutting) sets the new one in under the first plait. Mrs. Jones says that just as soon as this is all done, the bosom will give way in other places. She long ago discarded her practice of lining the bosoms throughout. Now she makes but one fine shirt at a time—so that she never has new ones altogether—allows an extra bosom and pair of wristbands to every two shirts, sets them into shirt No. 1, as that needs it, and then into shirt No. 2. Now hear old Mrs. Simpkins: "What's the use of a farmer's having fine shirts, anyhow? The land! what is the world coming to? My husband never had a fine shirt in all his life. He puts on his standing collar and stock, and one of those false bosoms ('*hypocrites*,' some call them), over his everyday shirt, when he goes to meeting, or takes a load to town, and then he is dressed fit for a king. At any rate, that old Alfred the Great, my Jeems used to read about, would have thought it fit for him. I suppose Kings nowadays would not think so, they've all got so grand—kings, parsons and their wives, farmer folks, and all...."

[FROM No. 30.]—"...A good housekeeper makes a good servant—a good housekeeper, you understand, not a good woman. Look at Aunt Debby, one of the best women in the world, and was there ever such an abominable muddle as her housekeeping? Sometimes Aunt Debby does a certain piece of work, sometimes it is left for Sarah Jane—trimming the lamps for instance. Sarah Jane leaves them for Aunt Debby, and Aunt Debby leaves them for Sarah Jane; if Aunt Debby sets out to do them, she must, in the first place, find her scissors. Accordingly, she runs up stairs and down to rummage the pockets of her dresses, then she pokes over the little heaps of strings and dried orange peel lying promiscuous in the cupboard; possibly her search is uninterrupted, but generally the butcher comes, or a neighbor drops in; the scissors are discovered after a time, but then the lamps are forgotten....."

[FROM No. 17.]—"...I will give my rule for bread-making—a certain one for me. Of course, the flour must be good; it should always be sifted just before using. We use baker's yeast, and get it fresh every week, as it is more convenient. For three loaves of bread, take 3 pints of milk or luke warm water (according to taste). Boil and mash 5 good sized potatoes, add 1 cup of yeast and a little salt. Stir all together at night with as much flour as you can stir in with a spoon. Leave it in a warm place to rise, and in the morning, when light, knead it well, adding sufficient flour. Let it rise until light and full of air-holes, and mould it out into loaves; then let it rise again to the point from which it was last worked down, and bake.—If I can not, through the medium of this Essay, teach a novice to make bread, I wish I could impress it upon those who do know how, to give more attention to it. If you know when bread is light, attend to it immediately, and not put it off, because you are doing something else, as the fermentation passes so rapidly into the acetous stage, from which no saleratus or leger-damain of that kind, can redeem it into good bread. Bread should be baked about an hour, and as cook stoves are so very different, every one should know best how to temper her own oven. The heat should be directed to the bottom as much as possible, for if the top crust forms too rapidly, it will press down the bread and prevent the expansion of the loaf, and so make a heavy streak. Or if not so bad as that, there will be great ugly cracks in the crust. When it is cut, if there are large air-holes in it, you may conclude it was not kneaded enough, and try to have it better next time..... A tin of raised biscuit may be easily made by taking enough of the bread dough when ready for moulding into loaves, and working in nearly a cup of butter. But to make capital raised biscuits, try the following rule, for it is certain: Six cups of milk, 1 of yeast, and a little flour stirred in at night. In the morning add 1 cup of butter, and let it rise the same as bread. For rusks, add 1 cup of sugar and 2 eggs, and varnish the tops, when done, with the white of an egg..... With regard to pie-making, probably it would have been much better for us, if no pies had ever come into existence; but since they have, and since people will eat them, we had better make them as nicely as possible. Every body knows that it takes equal parts of lard and water mixed in flour, to make crust, but every body does not know how to mix it. It requires a deftness that can be gained only by practice. Put the lard into the flour cold, and rub it in smoothly, adding the water by degrees and roll out neatly and quickly as possible. If you want the upper crust particularly flaky, roll it out partially and

dot here and there with lard. Then make it in a lump and roll out again for the pie. All pies are better baked in earthen dishes. There must always be an opening in the upper crust. Apple pies are especially nice, when made in these dishes, the apples sliced in without a bottom crust, sweetened, and a nice top crust, but you may sigh in vain at hotels, and at the many private tables, for any thing so simple and so delicious.... What we call 'Toad Pie,' (though I'm sure I don't know why) is delicious. The apples are stewed and then placed in a crust and baked. The top crust and some of the apple is then taken off. Sweeten and put on sweet cream or butter. Replace the top crust and put the apple over it, and season the same as the lower part; to be eaten warm...."

[FROM No. 11.]—(Extracts from *Vine Leroy's Experience*.)

"....'Come to supper, Mother, Aunt Peggy, Eva, and all.'—'In a minute, dear.'—'Five o'clock precisely.' Josey is always very punctual, I can trust her to get meals for us, with no fear of her not having them ready in season. Shall I take your work Peggy? Come Eva, we will go and see what Josey has got good for supper.—'Has she been getting supper all alone, Aunt Vine?'—'Yes, dear; she does it often.—I had become so interested in the story of 'A Summer,' in Leslie Goldthwaite's Life, I had not missed her. 'I wish you would take a magazine for me,' said Eva to her mother, Aunt Peggy. 'Do you know that that magazine costs two dollars a year? I will tell you sometime how the children pay for their magazines.' 'You have got a very nice supper, daughter, and have set the table very nicely.'—'You don't mean to say Vine, that Josey has made them short-cakes,' said Aunt Peggy.—'Oh, yes, she has made a good many.'—'Why don't you never let me help you so, Ma,' said Eva.—'You will never let me bake any, and I am as old as Josey.'—'Well, I never could bear to see girls of your age musing in dough,' said Aunt Peggy.—'My! how short and good these biscuits are.'—'Yes, I often tell Vine, that Josey can beat her making short-cakes.'—'Now, Papa, I don't like you to praise my cooking so in company.'—'But it must be you don't have such good ones as these very often, or you could not make so much butter,' said Aunt Peggy.—'We only have them about twice a week.'—'Twice a week, and short as this! You must milk all cream from your cows.'—'Let me tell her, Ma, how I made them,' said Josey. 'In the first place, mother always strains her buttermilk; and I take a bowlful of the dried cream we get from it, and a quart of buttermilk, in which I put two teaspoonfuls of soda, and a little salt. And here is a berry short-cake I have made; father likes them so well.'—'A berry short-cake in January! I never heard of such a thing,' said Aunt Peggy.—'Yes, when rolling my biscuit I roll a strip about two inches thick, and put it in a long tin and bake it with them. When it is done, I take it out on a platter, split it open and butter it, then put my stewed berries in it while hot. I had the berries hot, too, and sweetened well, with a good deal of juice. I think strawberries are better, but they were not plentiful last season, and red raspberries were, so we use them. Black raspberries are excellent to make them of, too, and any of them are better still, if kept by canning.'—'I wish Eva could cook like this,' said Aunt Peggy.—'And I wish my Ma would sometimes make such a short-cake as this, or let me learn how,' responded Eva. * * * 'Hoigho! there goes seven o'clock, and I must be off, it is the evening for the 'Farmer's Club,' so you must excuse me. There's a kiss for you Vine, now let me kiss you Peggy,' said Mr. Leroy, in a playful manner.—'Well! I declare! I don't believe you ever will leave off your boyish capers. Now you have been married fifteen years, and you kiss your wife like a boy, just because you are to leave her for a couple of hours. My husband hasn't kissed me since I married him.'—'I hope my husband will never be too dignified to kiss me.'—'And I guess I never will. Even the name of Joshua has never made a prophet of me. Good evening to you.'...."

Good Bread.—Mrs. M. W., writes, that after keeping house 12 years, and trying all sorts of bread recipes, and finding them all to fail some times, she adopted the directions published in the *Agriculturist* two years ago, (Feb. 1865), and she has never since failed to have good bread. Several others have written similarly, and we repeat the substance of the directions for the benefit of at least a hundred thousand present readers who did not have that number of the paper: Requisites, good flour, good potatoes, and good hops.—For stock yeast, good for 4 to 6 weeks, boil 2 or 3 handfuls of hops, 1½ hours, in 2 quarts water; strain the liquor on to 2 tablespoonfuls of flour, previously wet with cold water; stir well and leave until lukewarm; add ½ cup yeast, let it stand 15 to 20 hours, then bottle for use—to be shaken every time any is to be taken out.—Make a ferment thus: Wash clean and boil soft 2 quarts of potatoes, and mash fine while hot, with 1 quart of flour; reduce with

cold water, and add half a cup of the stock yeast from the bottle; let it ferment 8 or 10 hours, or until it begins to fall at the top, then strain. This will keep two weeks in cold weather, but must not freeze or heat.—For baking, in the evening lay the sponge with ¼ ferment, ¼ water, and ¼ milk if you have it, otherwise use ¾ds water; add a little salt; cover with a cloth in a warm place until morning, then knead in flour until it works free from the hands and board. Let it rise again in pans, then bake.—The sponge should be a little too soft to knead, but the more flour you add in kneading, the longer will it be in rising; in summer it should be quite stiff. It should always rise until it has a delicate, silky touch to the hand, or until it begins to fall at the top, which is a sure test. If worked too soon, it will be tough and dark colored; if not kneaded enough, it will be coarse-grained, while that properly kneaded will be fine-grained, light, and showy. When cold keep bread in a stone jar; it will thus remain moist much longer.

About the Winter Fashions.

BY MADAME DEMOREST.

If women are not healthy, and do not dress sensibly, it certainly is not the fault of fashion. This much abused goddess is, at least just now, doing every thing possible to render the clothing of both women and children healthy, convenient, and economical.—The trailed dresses which are so generally worn in the drawing-room, are hereafter to be confined to such privileged localities, and dresses looped up or shortened, so as to form a mere upper skirt to the petticoat, worn in the street.

These short dresses are the novelty of the season; they are always cut gored, and are vandyked out, or shaped in battlements, or square teeth, over a petticoat, ornamented with a plaiting: a flat, single plaiting, called "*Marie Antoinette*," is the most in vogue. A striped Balmoral petticoat is very good wear, the plaiting edged with a contrasting color, and put on with a narrow braid also of the contrasting color. This may be worn with all kinds of dresses, long or short, and with all dark or neutral colors. With a short dress cut out square, and bound, or edged with a flat silk, or jet braid, a short *sac*, or loose paletot is worn, also cut out square, and edged to match. If the dress is vandyked, a peplum basquine, or "*Ristori*" paletot is worn, both describing points to match with dress.

Ladies should be careful in changing the style of a walking dress, to change also the size and shape of their booped skirts to agree with it. A short dress is of course narrow, and requires a very narrow hoop, of the proper gored shape. If one can not be purchased, it is better to cut a short gored skirt (six gores) in cotton cloth, and insert in casings, five or six springs. A flounce made to button on and take off, will transform this into a handsome "dress" hooped skirt, the whole at a less cost than a good skeleton hoop, besides which, the indelicacy of skeleton hoops is avoided.

Ladies who do not like the short dresses, or who consider them unsuited to their age, will find the "*Benoit*" Dress Looper, a very graceful, convenient, and ornamental adjunct, extremely simple, and efficient in raising dresses without injury out of contact with the dirt of the streets. This useful novelty is made in all styles, and contributes a sufficient trimming to any dress.

An inexpensive, and very lady-like accessory to a handsome gored dress, consists of a dress peplum, which is attached to a waist-band, and forms a sort of pointed basque to the skirt, relieving it entirely of the look of plainness, which is to many so objectionable. The dress peplum opens on the sides, in front, and at the back, and may be trimmed with fringe, with braid, with gimp, with Cluny lace, or with anything adapted to the material, and in harmony with the other parts of the dress.

There is a simple and excellent Shoulder Brace, and skirt supporter, which ladies should always wear, in conjunction with a heavy hoop, or Balmoral skirt. It is composed only of bands of elastic, arranged so as to support the back and relieve the hips of the weight upon them, and this it does effectually, at the same time greatly promoting a fine walking pose, and symmetry of form.

Bonnets are still worn very small, [ridiculously so—Ed.] although the last Parisian advices indicate a considerable enlargement. A decided change, however, will not take place until spring. In the meantime, ladies may be thankful, that with little skill, trouble or expense, they can make their own bonnets.

A novel little invention has been introduced recently, which has such direct bearing upon the health of women, and children, that I can not forbear an allusion to it. This is a new Stocking Suspender, superseding the old elastics, which form a tight ligature around the limbs, causing congestion, rush of blood to the head, cold feet, and various evils. The new Suspender has no "machinery," requires no sewing on of buttons, is cheap, and keeps the stocking neat, and accurately in place.

BOYS & GIRLS' COLUMNS.

A Happy New Year!!!

To all the girls and boys of the *Agriculturist* family. A few years ago it took some 25,000 greetings to go all round, and give each family a share of our good wishes—now, 150,000 congratulations are not enough to distribute to the throng, in return for the welcomes they send us from all over the land. Kind feeling and the words of cheer which it prompts, come from a spring which can not be exhausted; they increase in the giving. But words are cheap—one little boy of our acquaintance, in reply to the salutation, "I wish you a happy New Year," was accustomed to ask, "What are you going to give me to make me happy?" This, of course, was not a very polite question, but it was very "common-sense-ical." A true friend will find many ways to bestow benefits upon those he loves, besides kind words, although these alone, are of great value. Well, 1866 has, we trust, proved that little folks are high in our regard. The pictures, puzzles, stories, and other good things which the *Agriculturist* has given them, need no further acknowledgment than we have received already in many thousands of pleasant letters, telling us how much enjoyment our monthly visits give.

THE BEAUTIFUL HOLIDAY PICTURE (next page)

is an earnest of what may be expected in 1867. There the old year is represented going out sorrowfully, as if regretting that more good has not been done, while the New Year, 1867, coming from the Horn of Plenty, indicates that we may look for abundant good things to follow; and we shall certainly try to do our part in keeping the horn well supplied.

All will feel like joining the joyous group who are so gleefully welcoming Santa Claus, and not a few will rejoice with those in the corners who are examining their holiday gifts, or joining in the sports of the season. Do not neglect to study the scene in the upper right hand corner of the sketch. It represents two little street sweepers, such as swarm in large cities, enjoying the Christmas pie which some kind-hearted friend has given them. The stable where they find shelter, and the manger, will bring to mind the story and the example of Him, "who though he was rich, for our sakes became poor," and will, we trust, lead many to bestow some good upon the poor of their own neighborhoods. To begin the year with goodwill shown to the needy, will be a most worthy way of exhibiting our gratitude for good received, and our own worthiness of expected blessings. God loves those who remember his poor. No surer way of making this a happy year can be found than keeping the resolution, to

DO GOOD TO SOME ONE EVERY DAY THIS YEAR.

Street Beggars.

In most large cities, street begging is a regular profession, having its own peculiar arts and mysteries, and requiring a special training to make it successful. A professional beggar studies appropriate dress, gesture, and manner of speech, as certainly, if not as thoroughly as the actors in a theatre, and many of them attain a degree of perfection in this part of their art, that might make their fortunes if practised on the stage. For example, notice that poor, tottering, white-haired old man, that has just entered our office; he has frequently called before. He is the very picture of a recent emigrant. His dress is scanty, but neat; apparently a great effort is being made to be decent, though poor. He wears wooden clogs, which give notice of his approach, as he hobbles toward you, and stretches out his long thin hand, that in itself has a most appealing look. In reply to a question, he mumbles over some strange jargon, that no one present can understand. Most persons at once think, "here is a case of real misfortune, an aged stranger in a foreign land, who has no doubt lost the little all he depended on to make him comfortable in old age." The whole appearance of the man is carefully studied and arranged to produce just this effect, and until known as a professional beggar, few can turn him away, without at least a trifle. Yet on some fine afternoon, in walking up Broadway, you may meet a well dressed, respectable looking old gentleman, walking erect, carrying a nice cane, rather for ornament than support, the picture of one who has laid by enough to make him easy for the rest of his earthly journey, and if you are sharp at scrutinizing countenances, you may recognize our poor pauper, for it is the same. He is said to be already wealthy from begging, but he keeps at his trade, part of the time, perhaps from mere habit.

Thousands of our readers have seen a one-legged man clad in an old military dress, stamping painfully along Park Row, not on crutches, but seated on the pavement, and moving himself by means of his hands, which are protected by thick leather mittens. He never asked for even a penny—that is in words—but his appealing look to the passers by, said more plainly than words could speak, "For the love of humanity, and in gratitude to

your country's defenders, please aid a poor maimed soldier," and hundreds daily answered the appeal. A few weeks ago this man was arrested by the police, as a vagrant, having no visible means of support, and consigned to the place on Blackwell's Island, provided for such cases. Just as he was about being sent up, his lawyer brought into court, deeds, mortgages, etc., proving him to be worth over twenty thousand dollars! This disclosure will probably put an end to his further begging operations.

These are but two examples out of hundreds here that could be described—some of them we may yet notice. The large majority of street beggars are impostors, and though it seems harsh, we believe it to be a safe rule to give to none of them, unless their cases have been first investigated and found worthy of help. If one desires to help the poor, as all should do, a little inquiry in almost any neighborhood will bring out deserving cases enough to employ all the resources of charity.

A Game!—"Boys," said a facetious farmer to his sons, "we had a pretty hard day's work yesterday, now let's have a game of chopping wood."

Singular Cure for Laziness.

A friend, whose name we are not at liberty to give, but who is well and widely known as a business man of sterling worth, was last year erecting a large building. One of his excellent peculiarities is, to allow no intemperance or profanity among his men, and to insist that every man shall work for the liberal pay he is willing to give. One day, this gentleman noticed that one of the builders was continually shirking, seeming to care only to pass away the time and draw his pay. Calling his foreman, who had the hiring as well as the overseeing of the men, our friend asked whether the lazy hand had been engaged for the season, or only for a short time. "For the season," was the reply, "but I can discharge him, I suppose."—"Oh! no," said Mr. —, "but I want you to go down to the village hotel and engage the best room you can find; let this man go there and occupy it; every month send his bill to me, and I will pay it."—The foreman informed the hired man of the instructions given, and he at once went to the owner. "I understand you are not satisfied with my work," said he.—"I find no fault with your work," was the reply, "but because you don't work." "I will leave, if you insist on it," said the man.—"Not at all—I don't turn you away, but I have given orders to have the best room at the hotel put at your service, since you want to play the gentleman at my expense, and I promise you I will pay the bill promptly every month, but I will not have your *bad example* among my men." The poor fellow, utterly dumb-founded at such novel treatment, scarcely knew how to reply, but looked as though he would like to sink into the ground. Finally, he asked, "Are you willing to try me for a week."—"Certainly," said Mr. —, "I am always willing to help a man who wants to reform." The man returned to his work, cured of his laziness, and from that day forth, no more industrious hand was to be found on the place.

Stories About Parrots.

As our young readers well know, the parrot may be taught to repeat many words. It is generally supposed that they attach no meaning to what they say, but simply utter the sounds, as they would any other notes. This may be so, but some incidents seem to show that they may sometimes know the use of language. A lady friend of the writer occupied part of a house where was kept a very talkative parrot. One day the lady came down stairs dressed in a short-gown and petticoat, the weather being intensely warm, when the parrot immediately cried out, "What frock you got on?"... Another friend relates that a parrot belonging to his landlady one day annoyed her very much by its continued talking and screeching. At last she seized the stick with which she had been stirring the clothes, and raised it threateningly, when the bird immediately cried out, "You saucy thing, poll won't speak another word," and remained silent almost the whole day.—A bird show was held at the Museum in New-York several years since, to which a parrot was sent that had been taught to repeat the Lord's Prayer. This was advertised extensively, and hundreds of persons went to hear the wonder, but to their disappointment, and the vexation of the owner, Poll would not utter a word during the exhibition, although fully able to do what had been expected. After the show, the parrot was taken home, and upon reaching its place, it exclaimed, "I suppose I can talk now," and became as voluble as ever. The bird's silence was not remarkable, as song birds will seldom sing freely, for some time after being taken to a new place; the speech on going home certainly seemed to indicate intelligence. A gentleman had taught his parrot to say, "Get your gun, John," which was well remembered one night by the bird, for burglars entered the house, and Poll, hearing a noise, screamed out at the top of her voice, "Get your gun, John," awakening her owner, and at the same time putting the robbers to flight.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the December number, page 441. No. 239 and 240. Mathematical Problems.—These were incorrectly stated last month, and are given properly below under the numbers 246, 247. No. 242. Geographical Problem.—We shall discuss this next month.—No. 240. Illustrated Rebus.—Tona Grape Vine (eye on a grape-vine).—No. 243. Conundrum.—It is papa-veraceous.—No. 244. Illustrated Rebus.—From infancy to adolescence a man's future position and stand in life are usually taken.

The following have sent in correct answers up to Dec. 1st.: George and William Foulk, John Norway, Joseph S. Bonaparte, Christian Wine, J. Califf, Clara Greiner, Julia Greiner, Avery L. Rand, James P. Veatch, A. Jackson, Andrew Jackson, Delmer D. Bryant, Jennie Cooper, J. B. Conant, Nellie J. Coe, Alfred Hawksworth, John E. Wittmer, B. J. Hammer, Sarah Purdy, Fred. Stanley, R. L. Selden, Frank B. Bourne, R. Maite Coulter, John H. Lehman, Samuel M. Edwards, Peter Smith, Nettie Waldron, H. S. Loper, D. Luther Roth, Mrs. Wm. Sarm, "H. D. S.," Sarah F. Winsor, Martin Keeney, James Ratleff.

New Puzzles to be Answered.

No. 245. Mathematical Problem, to be solved arithmetically. The crew of a ship consisted of Sailors and Soldiers. There were 22 sailors to every 3 guns and 10 over. The whole number of men was 5 times the number of soldiers and guns together. After an engagement in which one-fifth were slain, there lacked 5 to be 13 men to every 2 guns. How many guns, sailors and soldiers at first?

No. 246. Illustrated Proverb.—Usually found to be true.

No. 247. Mathematical Problem.—A man has a triangular piece of ground whose sides measure respectively, 500, 400 and 300 feet each. How can he divide it *equally* among his four sons, giving each a plot of the same form?

No. 248. Mathematical Problem, to be solved arithmetically. John and Charles, set out from C, and D, at the same time, to travel to E, the road from C to E, passing through D. John travels 7 miles an hour, and at that rate he would overtake Charles 5 miles before he arrives at E. But, after arriving at D, John travels 6½ miles an hour in consequence of which, he overtakes Charles just as he enters E. Supposing Charles, to travel 5 miles an hour, what are the distances between C, D, and E?

No. 249. Illustrated Rebus.—Well worth remembering.

No. 250. Illustrated Rebus.—Something unpleasant.

1867

WHEELER & WILSON

ROTARY HOOK

SEWING MACHINES.

625 BROADWAY.

"WOMAN'S GREATEST BOOK.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six year's service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family."
[American Agriculturist, Jan. 1865.]

THE GREAT FAMILY SEWING MACHINE.

GROVER & BAKER'S

HIGHEST PREMIUM
 Elastic Stitch
 SEWING MACHINE.
 495 Broadway, New York.

TAKE YOUR CHOICE!

We have already given away more than

FOUR HUNDRED SEWING MACHINES!

as premiums for new subscribers to the NEW YORK OBSERVER. Eighteen new subscribers with the money, for one year, \$6.75, will secure a \$55 MACHINE. Wheeler & Wilson, or Grover & Baker.—Send for circulars and sample copies; they will be sent FREE.—Terms, \$3.50 a year, in advance.

SIDNEY E. MORSE, JR. & CO.,
 37 Park Row, New York.

SOMETHING NEW.—An ingenious little article, just patented, needed in every household. AGENTS WANTED. Samples sent, post-paid, on receipt of 10 cts. Address W. A. BOARDMAN, 42 Whitney avenue, New Haven, Conn.

A MODEL PAPER.—The *Watchman & Reflector*, of Boston, has an enviable reputation for ability and enterprise. It has not been surpassed in merit by any religious journal in the country. But it aspires to higher excellence, and proposes to become, with the opening of the New Year, one of the most comprehensive family papers in the world. It will be greatly enlarged, and published on a double sheet; one sheet devoted, as hitherto to religious matter; the other to literary, social, monetary and agricultural articles. This latter department will be new and peculiar, with a rich variety of contents, embracing articles on current, moral, social and political questions; on the leading men of the age in thought and action; reviews of important books; tales for the family circle; agricultural and gardening matter for farmers; and monetary articles and reports of the markets for business men.

No Journal in the world certainly has a more comprehensive plan to meet the wants of all families, and of all the members in a family; and as the editorial staff will consist of nine men, all able and experienced in the several departments, who will be assisted by thirty contributors, many of them having a national reputation, the *Watchman & Reflector* must become a model family paper, unequalled in merit and in circulation. Its enterprising conductors deserve the largest success.

For Specimen copy. Address

FORD, OLINSTEAD & CO.,
 Publishers, Boston, Mass.

Our Young Folks

Is very highly praised by numerous State Superintendents of Schools and other distinguished Educators, for "the fresh ness, vigor, and variety of its pages," "its simplicity and purity of style," "its high moral tone," "pure and ennobling sentiment," "elevating and refining influences," "life-like and attractive illustrations," as "unquestionably the best juvenile magazine published in this country."
 TERMS: \$2.00 a year; large discount to Clubs. Specimen number, 20 cents.

Every Saturday

Has the best and freshest selections from the most popular Foreign Periodicals, including frequently articles by HENRY KINGSLEY, EDMUND YATES, ALEXANDER SMITH, MISS ROSETTI, MATTHEW ARNOLD, ROBERT BUCHANAN, FRANCES POWER COBBE, EDMOND ABOUT, ALEXANDER DUMAS, ANTHONY TROLLOPE, JEAN INGELW, and other eminent writers. TERMS: Single Number, 10 cents. Yearly Subscription, \$5.00.

"Fighting against WRONG and for the GOOD, the TRUE and the BEAUTIFUL."

FOR BOYS AND GIRLS.

THE LITTLE CORPORAL

Is acknowledged by the leading papers to be the
 Best Juvenile Paper in America.

The New York *Tribune* says: The only literary periodical which has ever succeeded in our Western States, is THE LITTLE CORPORAL. Its subscription list at the end of the first year numbered 35,000, and if it continues to be conducted with the same ability and enterprise which are now devoted to it, there is no reason why the second year should not close with a roll of 70,000 subscribers. It is an admirable periodical, lively, entertaining, instructive, unexceptionable in tone, and charmingly printed. It is published at the low price of \$1.00 a year.

We offer a

Magnificent List of Premiums!

The price of the Corporal is one dollar a year, in advance; sample copy, telling all about the premiums, ten cents.

Warranted superior to all Indelible Inks. Agents wanted. Circulars and sample Pencil sent post-paid, on receipt of Fifty Cents.

For sale by Stationers, Booksellers, and Druggists.

Address

The Indelible Pencil Co.,
 Northampton, Mass.

THE AUTOMATIC ORGAN.—This is the name which has been given by Messrs. Prince & Co., of Buffalo, N. Y., to one of the varieties of the popular instruments manufactured by them. The Automatic Organ is designed for a parlor instrument, and is preferred by many over the Piano-cased Melodeon. It is certainly a superb instrument, combining great power and sweetness, and finished in that exquisite style for which the Organs and Melodeons of Prince & Co. are so justly celebrated. The Automatic Organ is made with from two to eight stops, and from two to six or more sets of reeds. The large Organ with eight stops, though not equal to the Organ Melodeon with pedal bass, has the volume, power, and sweetness, sufficient for any ordinary sized Church. Send for full descriptive Catalogue, which will be forwarded free of postage. Address Prince & Co., Buffalo, N. Y.

HERALD OF HEALTH, November and December numbers free to new subscribers for 1867.

Dr. Lewis says, "It cannot fail to succeed."

The New York *Tribune* says, "It deserves a kindly welcome, as an efficient aid to the progress of popular education."

Demorest's Monthly says, "It has greatly improved under its new management."

\$2 a year; 20 cents a number. A Wheeler & Wilson's Sewing Machine, worth \$55, for thirty subscribers.

MILLER, WOOD & CO.,
 No. 15 Light-st., New York.

THE CHILDREN'S HOUR.—A new illustrated magazine for the Little ones. Edited by T. S. ARTHUR, 323 Walnut-street, Philadelphia, Pa. \$1.25 a year; 5 copies, \$5. Specimen numbers, 10 cents.

THE HORTICULTURIST.

TWENTY-SECOND ANNUAL VOLUME—1867.

A Monthly Magazine, devoted to the ORCHARD, VINE-YARD, GARDEN, and NURSERY; to *Culture under Glass*, *Landscape Gardening*, *Rural Architecture*, and the *Embellishment and Improvement of Country, Suburban and City Homes*. Handsomely Illustrated.

1867—Two Dollars and Fifty Cents; 1866 bound and post-paid, and 1867—\$4.50; 1865 and 1866 bound and post-paid, and 1867—\$6.

The three volumes contain 1,200 royal octavo pages.

67 Nassau-st., New York.

FIRST MORTGAGE BONDS

OF THE

SOUTH WEST PACIFIC R. R. CO.

Principal and Interest guaranteed
by the Atlantic and Pacific
Railroad Company, in
Coupon Bonds of
\$1,000 EACH,
TWENTY YEARS TO RUN.

Due September 15, 1886.

INTEREST AT THE RATE OF 7 PER CENT. PER ANNUM, PAYABLE IN THE CITY OF NEW YORK, ON THE FIRST DAYS OF JANUARY AND JULY.

These Bonds are issued on 77 miles of completed road, now in operation to Rolla, in the State of Missouri, which cost to construct.....\$1,500,000
And 13 miles of road graded, with material on hand, to be completed by January 1, 1867, at a cost of.....500,000
Together with 260,000 acres of land, now being disposed of at a minimum of \$5 per acre, (maximum \$40.).....1,300,000

Say present total value of.....\$6,300,000

The amount of Bonds issued is \$2,000,000, secured by mortgage to John P. Yelverton and Chas. H. Ward, of New York, as Trustees of the above-named property.

By a provision of this Mortgage, when Lands are sold to the amount of \$10,000, it is to constitute a Special Fund for the redemption of a like amount of these Bonds, at a rate not exceeding 105 per cent. They are also receivable at PAR by the Company in payment of its sales of Lands.

At St. Louis this road connects with all the Eastern Railways, and runs west through the most attractive parts of the State of Missouri via Franklin, St. James, Rolla, Lebanon, Marshfield, Granby (Lead Mines), and Neosho, to the west line of the State. At Springfield it will connect with the great ATLANTIC AND PACIFIC RAILROAD (its eastern terminus), to the Pacific.

When completed, it will present a road of 310 miles in length, costing about.....\$12,000,000
With 1,036,000 acres of Land valued at.....10,000,000

Showing a total value of.....\$22,000,000
With a total amount of Bonds authorized, with the guarantee as above, of \$7,250,000, which may be issued at a rate not exceeding \$25,000 per mile of completed work as it progresses.

Of the present issue of \$2,000,000 of Bonds, the sum of \$500,000 is now offered for sale at the low rate of 80 per cent., after 1st January, the rate will be 85 per cent.

For further particulars apply to

WARD & CO. BANKERS,

No. 54 Wall Street, New York.

Highly Important to Manufacturers and Capitalists.—The *New Self-Holding Volkman Plow*.—The most competent judges who have examined the new Patented Self-Holding Volkman Plow, are of opinion that it is superior to any plow now in use, and that it must therefore, soon supersede every other plow. For a description of its peculiar features we refer to the N. Y. Semi-Weekly Tribune of Nov. 13, the Semi-Weekly Times, Nov. 9, the N. Y. Independent, Nov. 15, the Artisan, Dec. 5, and other leading papers. Mr. Volkman, the inventor, is ready to entertain offers for the sale of State rights, or for the formation of a partnership. Address J. VOLKMAN, No. 171 West Thirty, eighth Street, New York City.

KNOX FRUIT FARM & NURSERIES.

One Hundred and Fifty Acres in Grapes, Strawberries, Blackberries, Raspberries, Currants, Gooseberries, &c., &c.

Send for our Catalogue, which is a valuable Treatise on their Cultivation.

We were among the very first to engage in growing **SMALL FRUITS**, on a large scale, and for many years have been making a collection, which is unsurpassed if equaled anywhere.

GRAPES.

The **Concord** is decidedly the most popular grape in the country. It is now generally planted, and gives greater satisfaction than any other. The

GREELEY PRIZE

has just been awarded it as the grape of the greatest value. For full description SEE CATALOGUE.

Hartford Prolific and **Crevelling**, are the best very early grapes yet thoroughly tested, and are very profitable.

Ives is destined to be, if it is not now, the leading wine grape of the country. For full description of this invaluable grape, SEE CATALOGUE.

Rentz is nearly of the same value, and is a most vigorous grower.

Martha is a **White Concord**, and is destined to be among White grapes, what its parent, the Concord is among the colored varieties.

Black Hawk promises to be a grape of very great merit—perhaps the earliest of all.

For description of above, and **Iona**, **Israella**, **Adirondack**, and all other desirable kinds, as well as much valuable information on Grape Culture, send **10 Cents** for Catalogue.

Our vines are grown in the open air, from bearing wood taken from our extensive Vineyards.

STRAWBERRIES.

For many years we have given earnest attention to the cultivation of Strawberries. Our long and varied experience gives us great advantages, in the selection of such varieties as will give the best satisfaction to the grower, whether for home or market purposes; our collection, in variety, quality, and quantity, is unsurpassed, if equaled anywhere. We call special attention to the

JUCUNDA—OUR NO. 700.

After thoroughly testing this variety for seven years, we unhesitatingly say, that for UNIFORM and LARGE SIZE, BEAUTY OF FORM and COLOR, ENORMOUS YIELD, LONG CONTINUANCE IN BEARING, GREAT PROFIT, HEALTH AND VIGOR OF PLANT, and other desirable qualities, it is the most valuable Strawberry of which we have any knowledge. All who have seen it on our grounds, prize it alike highly.

L. L. WHITLOCK,

Room 6, { 145 Nassau-street, } New-York.
37 Park Row, }
All kinds of Trees, Shrubs, &c., bought and sold on Commission. Producers are requested to send a list of Stock they have for sale.

Advantages in Buying of L. L. Whitlock.

- 1.—He keeps a list of the cheapest Stock in the Market.
- 2.—He buys Stock for you at Wholesale price.
- 3.—His twelve years' experience enables him to know how to select good Stock.

Office Hours, from 11 A. M., to 1 P. M.

HUTCHINSON'S PATENT UNIVERSAL EAGLE PLOW—Makes three furrows any size or depth, while the driver rides, and without leaving his seat, has full command of the Plow. STATE or COUNTY RIGHTS for sale on reasonable terms. For descriptive Circular, apply to
HUTCHINSON & CO.,
Care A. WINCHESTER, 706 Chestnut street, Philadelphia, Pa.

THE "THREE WARRANTS."—Please read my advertisement headed "Farmers and Gardeners."
JAMES J. H. GREGORY, Marblehead, Mass.

**WE WANT AN AGENT IN EVERY COUNTY
TO SELL OUR
POPULAR SUBSCRIPTION BOOKS**

They are the most popular books now published, and many Agents are making \$10 to \$20 a day. Send for Circulars giving full particulars to **RICHARDSON & CO.,** Publishers, 510 Broadway, New York.

Our present stock of plants of **Jucunda**, and all other valuable varieties is the largest and best we have ever offered.

Send **10 Cents** for Catalogue, which is a complete Manual on the Strawberry.

CURRANTS.

The demand for this valuable fruit is greatly increasing every year. We have taken special pains to make the best possible collection, and our stock is, perhaps, much the largest in the country.

We offer very superior plants of **Versaillaise**.—The best of all.

Fertile de Angers.—Very similar to the above.

Cherry.—Excellent for jelly.

Victoria.—Very late and good.

White Grape.—Superior for Wine.

La Hatine.—Vigorous grower and very good.

Black Naples.—Good for Jams and Jellies.

We can furnish any other desirable kinds.

Also,

Raspberries, Blackberries, Gooseberries, &c., &c.

Send 10 cents for our **Descriptive and Illustrated Catalogue** with **Supplement**.

It contains **Descriptions** and **Illustrations** of the leading varieties of

Grapes, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, &c.—Select **Lists of Fruits**, made up with great care.

Letters from Eminent Fruit Growers, and Reports of various Committees, who have visited our grounds, including the **Report of the Ad Interim Committee of the Ohio Pomological Society, 1865**, written by the President, Dr. JNO. A. WARDER, from which we extract:

"Four things struck all the visitors as especially worthy of note: The modes of propagation and culture of the soil, the varieties under culture and trial, the wonderfully abundant product of magnificent berries, and the excellent and successful mode of harvesting and marketing the fruit, all of which may properly be introduced into this Report for the benefit of our fellow members."

Much valuable information, in each of these prints, is contained in this Report, and other parts of the Catalogue

J. KNOX,

Box 155, Pittsburgh, Pa.

VICK'S

ILLUSTRATED CATALOGUE

of Seeds and

FLORAL GUIDE FOR 1867,

Is now published. It contains nearly 100 pages, 100 fine Illustrations on Wood, of choice Flowers and Vegetables, and a beautiful Colored Flower Plate for Frontispiece. Also, descriptions of the finest flowers grown, with full and plain directions for culture.

Sent to all who desire, postage paid, for 15 cents—not half the cost. Sent free to all my customers of 1866, without being ordered. Address

JAMES VICK,
Rochester, N. Y.

As will be seen by an advertisement in another column, **HENRY WARD BEECHER** is engaged in writing a story for the *New York Ledger*. The circulation of the *Ledger* is larger by one hundred thousand copies than that of any weekly or daily paper in the country.

SUPERIOR GARDEN AND FLOWER SEEDS.

B. K. BLISS'

CELEBRATED SEED CATALOGUE,

and Guide to the Flower and Kitchen Garden.

Beautifully Illustrated with upwards of One Hundred Engravings.

The Thirteenth Edition with Supplement for 1867, is now in press, and will be ready for distribution early in January. It will contain 112 pages of closely printed matter, and upward of One Hundred finely executed engravings of Flowers and Vegetables, and a descriptive list of Two Thousand varieties of Garden and Flower Seeds, embracing all the NEW VARIETIES worthy of cultivation, introduced the past season—both of European and Home production, with explicit directions for their culture,—also a list of One Hundred and twenty-five varieties of French Hybrid Gladiolus, including the leading novelties of the past season, with many other Summer Flowering Bulbs, consisting of Amaryllis, Tu-

beroses, Tigridias—Lilies in great variety, etc. To which is added a list of a few of the choicest varieties of Grapes, Strawberries, Raspberries and other Small Fruits, Bedding Plants, etc., etc., cultivated at his gardens, with much other useful information upon the subject of gardening generally, which will be found useful to all engaged in the delightful occupation of gardening. A copy of the Catalogue will be mailed to all applicants enclosing Twenty-five Cents. Our regular customers supplied without charge. Address

B. K. BLISS,
Lock Box No. 11,
P. O. Springfield, Mass.

STRIPED LEAVED JAPANESE MAIZE.

The experience of the past season fully confirms all that we stated in reference to this beautiful plant, when introducing it to the public last spring; and we are in receipt of many flattering letters from the leading Florists in Europe, all of whom agree that it is the finest plant for decorative purposes that has been introduced for many years. Certificates of Merit and numerous Prizes have been awarded to Exhibitors at the various English and Continental exhibitions, not the least of which was that of the "Royal Horticultural Society's International Show," all grown from seed

furnished by us last spring to our European correspondents.

"Cosmos," Agricultural Editor of the Saturday Evening Post, writes us that it is superior to any other for table use, as green corn.

Packets containing about 40 seeds, 25 cents.

Prices to the Trade, in bulk or in packets, will be given upon application.

Springfield, Mass.

A Cough, A Cold, or
A Sore Throat,

REQUIRES IMMEDIATE ATTENTION
AND SHOULD BE CHECKED.

IF ALLOWED TO CONTINUE,

Irritation of the Lungs, a Per-
manent Throat Disease,
or Consumption,

IS OFTEN THE RESULT.

BROWN'S BRONCHIAL TROCHES

HAVING A DIRECT INFLUENCE TO THE PARTS,
GIVE IMMEDIATE RELIEF.

For Bronchitis, Asthma, Catarrh, Consump-
tive and Throat Diseases,

TROCHES ARE USED WITH ALWAYS GOOD SUCCESS.

SINGERS AND PUBLIC SPEAKERS

will find Troches useful in clearing the voice when taken before Singing or Speaking, and relieving the throat after an unusual exertion of the vocal organs. The Troches are recommended and prescribed by Physicians, and have had testimonials from eminent men throughout the country. Being an article of true merit, and having proved their efficacy by a test of many years, each year finds them in new localities in various parts of the world, and the Troches are universally pronounced better than other articles.

OBTAIN only "BROWN'S BRONCHIAL TROCHES," and do not take any of the Worthless Imitations that may be offered,
SOLD EVERYWHERE.

DEMAREST'S BED-CLOTHES CLASPS are real Guardian Angels, at 25 cents each. Every parent should secure these invaluable protectors. No. 473 Broadway. Mailed post free.

Thorough-bred Poultry.

FOWLS, of all the valuable choice breeds, furnished at reasonable prices. They are carefully selected from the progeny of the more recent importations, and their purity is guaranteed. Orders sent by mail promptly filled.

Circulars, with full descriptive list, will be forwarded to any address on receipt of stamp. American Live Stock Co., No. 199 Water-st., New York City.

A. T. SCHAUFFLER, Superintendent.

New and Rare Vegetables.

I present to the Public my Annual List of New and Rare Seed for 1867, many of which I send out the first time this season.

MARLBHEAD MAMMOTH DRUMHEAD CABBAGE.—(The largest Cabbage in the world. Weighs from thirty to sixty pounds to the head, and is tender and sweet. No cabbage does so well in the South as this.) **CANNON BALL CABBAGE.**—(About as round and hard as a cannon ball. An early sort, and the hardest heading of all Cabbage.) **STONE MASON CABBAGE.**—(Standard variety of Winter Drumhead Cabbage in Boston market. Under good cultivation every plant on an acre will make a large and hard head. It is remarkably tender and sweet. In half ounce packages.) **LENORMAND'S MAMMOTH CAULIFLOWER.**—(A new variety, the largest of all the Cauliflowers family. Very reliable for heading.) **VERY EARLY ERBUT CAULIFLOWER.**—(New, remarkably early, and fine for hot-beds.) **NEW YORK IMPROVED EXTRA LARGE PURPLE EGG PLANT.**—(This grows to a larger size, and is of a richer color, than the Common Large Purple Egg Plant.) **STRIPED GAUDELOUPE EGG PLANT.**—(An elegant variety for the table. The stripings of white, purple and yellow give it a magnificent appearance.) **ORNAMENTAL KALE.**—(The great variety in color, and structure of the leaves, make them elegant ornaments for the flower garden and among shrubbery.) **MAMMOTH SWEET CORN.**—(The largest of all Sweet Corn. Sweet, and excellent for the table. The ears weigh, as gathered, from two to three pounds each.) **MAMMOTH FRENCH SQUASH.**—(Sometimes grown to weigh over two hundred pounds. They grow well proportioned, and are finely colored.) **VEGETABLE CATERPILLARS.**—(Vegetable curiosities, the seed-vessels resembling caterpillars.) **VEGETABLE SNAILS.**—(A French oddity, the seed vessels of which resemble snails.) **VEGETABLE WORMS.**—(Another curious vegetable product.) **SNAKE CUCUMBER.**—(A very long variety which grows coiled up, having the appearance of a large snake.) **COMMODORE NUTT PEA.**—(A new dwarf Sugar PEA, grows about one foot high, with pods eatable.) **LAXTON'S PROLIFIC EARLY LONG POD PEA.**—(A new and quite distinct variety. Many of the pods contain from ten to twelve Peas each.) **DWARF INDIAN CHIEF BEAN.**—(Those who have grown the Pole Indian Chief will be pleased to find a bush variety of this fine String Bean.) **GIANT WAX BEAN.**—(A new Pole Bean, being an improvement on the Indian Chief, it being a larger and longer Podded Bean than that choice variety. The Wax Beans (so called because the pods are of a wax color,) are the best of all String Beans.) **NORBITON'S GIANT CUCUMBER.**—(A new English variety, the finest, longest, and most prolific Cucumber in cultivation.) **WARD'S NECTAR MELON.**—(When compared with all other sorts, this has been awarded the palm as the best of all green-fleshed Melons.)

Each of the above sent to any part of the United States, and warranted to reach the purchaser, at twenty-five cents per package.

AMERICAN TURBAN SQUASH.—(The driest, finest grained, and best flavored of all Fall Squashes. The packages contain about fifty seeds.) **HUBBARD SQUASH.**—(I was the original introducer of this, and the seed is true.) **YOKOHAMA SQUASH.**—(A new variety from Japan; very prolific. The quality resembles a fine Crookneck, but is much superior.) **BOSTON MARROW SQUASH.**—(My variety took the premium for purity at the Annual Fair of the Massachusetts Horticultural Society in 1865.) **PARA SQUASH.**—(A bush Squash from South America, which can be kept into winter. Oblong in shape, of good size, fine-grained, and excellent quality, far superior to any standard variety of bush Squash.) **IMPROVED GREEN GLOBE SAVOY CABBAGE.**—(For family use, the Savoy is the richest of all Cabbages. The heads of this variety are large, hard, and of most excellent quality, the stumps short. Remarkably reliable for heading.) **PANCALIER SAVOY.**—(The French consider this the earliest Cabbage grown.) **SMALL EARLY ULM SAVOY.**—(Very early and reliable.) **BURNELL'S KING OF THE DWARFS.**—(In England this is considered the earliest of Cabbages. Very dwarf, fine quality, and sweet.) **LARGE BRUNSWICK SHORT STEM.**—(A very large and very early Drumhead, much sought for by market gardeners.) **LITTLE PIXIE CABBAGE.**—(An early dwarf; stump, short; heads, pointed, and very hard, fine quality, and very sweet.) **TILDEN'S NEW TOMATO.**—(Large, round or oblong; color, rich scarlet; vines, dwarf, and very productive.) **EARLY YORK TOMATO.**—(Very early, and remarkably prolific, has yielded at the rate of over one thousand bushels per acre. Fruit of good market size; flat, round shape; quality, excellent.) **COOK'S FAVORITE TOMATO.**—(A large, apple-shaped variety; very prolific; quality, superior; decidedly the best of the apple-shaped Tomatoes.) **MAMMOTH CHIHUAHUA TOMATO.**—(Enormously large, weighing from two to three pounds. Some single specimens will weigh a quart measure.) **NEW MEXICAN TOMATO.**—(Very large, round Tomato; a great bearer; resembles, in color, Lester's Perfected, but an improvement on it, in always being round.) **TREE TOMATO.**—(A French variety; grows erect in the form of a bush.) **MCLEAN'S ADVANCE PEA.**—(A new English wrinkled PEA. A decided improvement on the Champion of England; bears well, with Peas equally sweet, is much larger, and does not run nearly as high.) **MCLEAN'S LITTLE GEM.**—(A new dwarf wrinkled PEA; grows about one foot high, very early, only a few days later than the Dan O'Rourke; a decided acquisition.) **VILMORIN'S NEW WRINKLED, EDBLE, PODDED PEA.**—(The first wrinkled sort yet found, the pods of which can be eaten.) **CARTER'S FIRST CROP.**—(A new English PEA, sent out as the earliest of all varieties.) **HAIR'S DWARF MAMMOTH.**—(A wrinkled PEA, larger than Champion of England, growing only half its height; quality, fully equal to the Champion.) **TOM THUMB PEA.**—(As early as Dan O'Rourke, grows ten inches high, and is remarkably prolific.) **DREW'S NEW DWARF PEA.**—(Peas, very large, egg-shaped; each plant forms quite a bush. Peas should be planted about a foot apart. Early, dwarf, and very prolific.) **BROWN'S NEW DWARF MARROWFAT.**—(Warranted to be the earliest and most dwarf Marrowfat PEA grown. A capital PEA for market gardeners.) **FORTY DAYS' CORN.**—(Earlier than any Sweet Corn. Desirable as an early sort.) **BATES' EXTRA EARLY SWEET CORN.**—(A variety of wrinkled kernalled Sugar Corn; earlier than Darling's Early, and excellent for table use.) **MAMMOTH FLINT CORN.**—(Ears grow sixteen inches long; stalks very tall and stout, and matures as far North as Central New

England.) **CROSBY'S EARLY.**—(The earliest of all twelve rowed Sweet Corn. The Massachusetts Horticultural Society offered special premiums for this new Corn at their last Annual Fair. It is of good size for market, and a decided acquisition.) **MEXICAN SWEET CORN.**—(I still find this to be the sweetest and most tender of all varieties of Sweet Corn. Nothing can equal it for the table.) **GOLDEN SWEET CORN.**—(A Sweet Corn of golden color; early, of good size, and excellent quality for the table; flavor, fine, and distinct from any other variety.) **YARD LONG BEAN.**—(A curious Bean; pods growing over two feet long; foliage, a rich, dark, glossy green.) **CONCORD BEAN.**—(This new Bean is probably the earliest Pole Bean grown; very prolific, and of excellent quality, either as a string or shell Bean.) **FEJEE BEAN.**—(A new bush Bean; the earliest and hardiest of all beans; very prolific, and worthy of general cultivation.) **INTERMEDIATE HORTICULTURAL BEAN.**—(An excellent bush Bean for marketmen. Pods of the same rich color as the Pole Horticultural.) **CALIFORNIA BEAN.**—(A very early, large, flat Pole Bean; excellent, either green or baked.) **MOTTLED CRANBERRY.**—(An improvement in health, vigor, and productiveness on the old fashioned Cranberry. Few Pole Beans will yield equal to this. Pods, long, large, and well filled.) **SIMM'S EARLY BEET.**—(A new, early sort, well shaped; as early as Bussano, and darker.) **NEW TURNIP BEET.**—(Round, flat-shaped, very early, and very nice.) **CASTLEBANDY BEET.**—(A famous French variety; flesh, a deep purple color, very tender and sweet.) **CRAPAUDINE BEET.**—(Rough skinned; color, very dark purple. Esteemed by the French as the best of all Beets for table use.) **WHYTE'S VERY DEEP RED BEET.**—(Medium size, dark color, very sweet, and excellent for table use.) **YELLOW OVOID MANGEL WURTZEL.**—(For cattle. Of seventeen varieties tested, the crop of this exceeded all.) **EARLY CRACKER ONION.**—(Earliest of all the yellow sort; quality, very delicate and sweet.) **HOOD'S NEW DWARF IMPERIAL PURPLE CELERY.**—(A choice new English variety.) **TURNER'S INCOMPARABLE DWARF WHITE CELERY.**—(A first class English variety.) **READ'S MATCHLESS CELERY.**—(A premium English variety, fine, solid and red.) **BOSTON MARKET CELERY.**—(True. This is the short, compact, solid variety, so often admired by strangers in the markets of Boston.) **TRUE BOSTON CURLED LETTUCE.**—(The most elegant of all the Lettuce family, grows in the form of a Rosette.) **WHEELER'S TOM THUMB LETTUCE.**—(A choice new variety, in high favor with those who have grown it.) **PERPIGNAN LETTUCE.**—(This is an excellent Lettuce for standing the summer heat. Heads, compact, attaining to seven inches in diameter.) **NEAPOLITAN CABBAGE LETTUCE.**—(One of the finest Cabbage Lettuces yet introduced.) **SIX VARIETIES OF CABBAGE LETTUCE.**—(Six of the choicest varieties in one package.) **ORANGE WATERMELON.**—(When fully ripe the skin will peel off like an Orange.) **ALLEN'S SUPERB MUSK MELON.**—(Quality, superior; by some called the "Queen of Melons.") **LARGE PERSIAN MUSK MELON.**—(A fine, large variety.) **WHITE JAPANESE MELON.**—(Flesh, greenish white, very thick meat; one of the earliest and sweetest of all melons.) **DWARF BROOM CORN.**—(This is thought to make a better brush than the common tall sorts.) **CHUFAS, OR GROUND ALMONDS.**—(These taste very much like a Coconut; are very prolific, yielding 100 to 1.) **ORNAMENTAL GOURDS.**—(Many varieties in one package.) **NEW JERSEY HYBRID CUCUMBER.**—(A remarkably long variety; an improvement on the White Spined.) **IMPROVED LONG GREEN CUCUMBER.**—(This is the longest of all the Long Greens.) **CHINESE SCARLET EGG PLANT.**—(Of magnificent scarlet color, and highly ornamental.) **MAMMOTH MILLET.**—(Extra tall; seed heads much larger than any other variety.) **SURRY WHITE WHEAT.**—(A new English Winter Wheat, highly recommended for poor soils, remarkably free from blight and rust.) **OTAHETIAN SUGAR CANE.**—(This yields more Sugar than any other variety of Sugar Cane grown in the North.)

Any of the above varieties will be forwarded, post-paid, and warranted to reach the purchaser at fifteen cents each. **EARLY SEBEC POTATOES.**—(Coming rapidly into favor in Boston and vicinity as a first class, early market Potato. Large size, excellent quality, and remarkably productive.) **EARLY GOODRICH.**—(True.) **SHAKER'S FANCY.**—(A new variety of white-fleshed Potatoes, considered as early as Early Goodrich, yielding equally well, and rapidly gaining favor in Pennsylvania. This and the Early Sebec are of better shape for market purposes than the Early Goodrich. Four pound packages of either of these varieties sent to any address, warranted to reach the purchaser, on receipt of one dollar. All orders for Potatoes will be put on file, and be filled as soon as danger from freezing is past.

Catalogues containing over two hundred varieties of warranted Garden Seeds, one hundred and twenty-five of which are of my own growing, sent gratis to all applicants.

I warrant three things: 1st. That my seed is genuine. 2d. That your money shall reach me. 3d. That my seed shall reach you. Can the Public ask for anything fairer than this? **JAMES J. H. GREGORY,** Marblehead, Mass.

Sing Sing Grape Vines.

I have a few thousand Grape Vines yet unsold. Good single eyes, one year old, grown under glass, and out-door, at the following prices, if the cash come with the order:

Iona No. 1, per 100, \$85, per 1,000, \$800.

Iona No. 2, per 100, \$65, per 1,000, \$600.

Iona No. 3, per 100, \$45, per 1,000, \$400.

Israella No. 1, per 100, \$85.

Israella No. 2, per 100, \$70.

Israella No. 3, per 100, \$50.

Adirondack No. 1, per 100, \$70.

Adirondack No. 2, per 100, \$50.

Adirondack No. 3, per 100, \$40.

Allen's Hybrid, No. 1, per 100, \$40.

Allen's Hybrid, No. 2, per 100, \$30.

Allen's Hybrid, No. 3, per 100, \$20.

My Vines are as good, if not better, than any others offered. First class, wood grown under glass, of Iona and Israella: Iona, per 1,000 buds, \$55. Israella, per 1,000 buds, \$55.

J. F. DELIOT, Vine Grower,

Sing Sing, New York.

GRAPE VINES.

Iona, Israella, Adirondack, Concord, Diana, Hartford, Rogers', &c., &c. Prices too low to advertise in this Paper without injury to the Trade. By the use of my patent process, I am enabled to produce the largest and best vines for future growth and productiveness, grown on the American Continent. See cut in Sept. No. page 384. Send for Terms to those forming Clubs, which is worthy of particular attention.

If illustrated and Descriptive Catalogue is wished, send two red stamps. Address **F. L. PERRY, Canandaigua, N. Y.**

Send for Catalogues GRATIS.
WILLIAM PARRY, Cinnamon, N. J.

**Silver Leaved Maple Trees Given
Away.**
To any person sending me nine Subscriptions to the Amer-
ican Agriculturist at \$1.50 each, for 1867, I will send them
500 trees as above; for 15 names, at \$1.50 each, 1,000 trees;
40 names, \$1.50 each, 3,000 trees. The trees are all first-class,
one year, 1 1/2 to 2 1/2 feet, are worth the sum required, should
the paper not be wanted, (which of course will be). Trees
shipped early in spring, well packed. Send along Green-
backs or P. O. Orders, to
J. H. GRAVES, Dement, Ogilvie Co., Illinois.

**Valuable and Important Catalogue
For the Spring of 1867.**
Containing Instructions from fifteen years of practical ex-
perience in the cultivation of **Small Fruits**. Tells how
to plant, grow and market. How to make the cheapest and
best shipping boxes and stands, and boxes to gather the fruit.
How to gather, and many other important and valuable
hints, which will prove invaluable to the market grower, as
well as the amateur, and those growing but a small bed, or
family use. Sent to all applicants as soon as issued, in Dec.,
on receipt of 10 cts. Address A. M. PURDY, South Bend, Ind.

CRANBERRY PLANTS, bearing vines in parcels
of 100 each, for price and culture, send for Circular.
TROWBRIDGE'S GRAFTING WAX—Nurserymen and Grafters
pronounce it of first quality, and cheaper to purchase than
to make it—put up in large packages for Nurserymen, and in
one, one-half and one-quarter pound rolls for retailing, with
directions for use. Liberal discount to Nurserymen and
Dealers. **TREE VARNISH**, an indispensable article in trim-
ming trees, causing the wound to heal sound. \$3 per dozen;
\$5 cents, single bottle.
F. TROWBRIDGE, Milford or New Haven, Conn.

Burroughs' Nurseries.

Post Office Address, Vergennes, Vt.—Fruit and Ornamental
Trees, Grape Vines, Evergreens, Roses, &c., &c. Send 1
stamp for Price Catalogue, or 2 stamps for General Cata-
logue.

STRAWBERRY, RASPBERRY, AND BLACKBERRY
Plants, Good Roots, Best Varieties. Inducements of-
fered to those wishing a few of each variety. Catalogue
gratis; send for one. JOHN S. COLLINS, Moorestown, N. J.

TO FARMERS AND PLANTERS.
The LODI MANUFACTURING CO., having the exclu-
sive control of the night soil of New York City, have
received therefrom the past season, some 60,000 tons of night
soil, which they have manufactured up into an *extra fine*
article of Poudrette of superior quality, (put up in bright
new packages,) (which they offer for sale at the usual
price.) For
CORN, TOBACCO AND COTTON
This article has no superior, taking into consideration its
price, and the effects derived therefrom. It is equal, pound
for pound, to the best brands of Super-phosphates in market
sold at \$60 per ton, while the Poudrette costs only \$20. It
matures a crop two to three weeks earlier, does not injure
the seed when brought into contact with it, and is cheaper
by 100 per cent, than any other fertilizer offered for sale.
Send for a Pamphlet. Address
THE LODI MANUFACTURING CO.,
66 Cortlandt-st., New York.
ROCKY MOUNT, Edgecombe Co., N. C., Nov. 13, 1866.
JAMES R. DEY, Pres't.—Sir: In regard to the results of
our experience in the use of your Improved Poudrette on
this year's Cotton crop, we beg leave to say that the season
has been unfavorable to the action of all Fertilizers. Sev-
eral kinds were used by us, and with the exception of your
Poudrette, with little or no effect to the crop. Where the
Poudrette was applied it gave us near a *half bale* more
per acre and caused the Cotton to open much earlier. We
would recommend it not only as a manure suitable for the
growth of Cotton, but for the improvement of the soil.
Yours, very respectfully,
HENRY P. STULTS & BRO.

AMMONIATED PACIFIC GUANO.
The attention of Farmers and Agriculturalists is called to
this article, as superior to anything else offered in the market.
Equal to Peruvian Guano, and costing much less.
We offer this fertilizer in lots to suit all purchasers. A
liberal discount made to the Trade.
Pamphlets with copies of Analysis by Dr. Liebig, of Balti-
more, and Dr. Jackson, Massachusetts State Assayer, and
testimonials from Agriculturalists, showing its value, and
directions for use, can be obtained from
J. O. BAKER & CO., SELLING AGENTS,
131 Pearl-st., New-York.

Thorough-bred Chester White Pigs
For Sale; from 10 weeks to 1 year old. For growth and
quality, can not be excelled in the United States. For de-
scription and Prices, send for Circular. Address
JAMES YOUNG, Jr. & CO.,
Marshallton, Chester Co., Pa.

WANTED.—A good thorough-bred Durham Bull, from
an extra milk strain. Address T. C., Box 317, Warsaw, Ind.

DEMOREST'S MONTHLY MAGAZINE is un-
questionably the most useful, sparkling, and popular
Magazine, and offers the most liberal terms and premiums
for clubs. Send for circular. Back numbers, 10c.; postfree.
No. 478 Broadway. The January number, with extraordi-
nary Holiday attractions, now ready. Sold everywhere.

Lane's Purchasing Agency,
FOR PURCHASING
at the lowest regular price, any thing to be
procured in New York City, and at
other accessible points.
Orders for Books for private and public Libraries carefully
attended to. Special attention given to the selection of Cir-
culating Libraries, and Libraries for Farmers' Clubs. Val-
uable Books can be purchased by me at the frequent Auction
Sales, much below the regular prices.
HARVEY B. LANE, 151 Nassau-street, New York.

HALSTED & PUTNAM

For the sale of Country produce of all kinds.
Send for Weekly Price Current. Marking Plate and
Circular with Packing and Shipping directions.

NURSERY FOR SALE.
We offer for sale a Nursery containing 120 Acres of land
selected for its favorable location and soil, well improved,
underdrained, &c. Situated a short distance from Toledo,
Ohio, in a pleasant neighborhood. All its surroundings mak-
ing it a desirable place for the business and a residence.
There is on the premises an ELEGANT RESIDENCE, sur-
rounded by a fine PARK, laid out and ornamented with
Walks, Shrubberty, &c.—Also, THREE TENEMENT HOUSES,
an Office, Packing House, Corn Crib, Root Cellar, Barn, Stab-
ling room for ten horses, large Cistern, Propagating House
heated by HITCHINGS Boiler No. 5, Green-Houses, Growing
Houses, Forcing Pits, Sash for Hot Beds, &c.—Also, an
ORCHARD, containing 2,000 Fruit Trees of the best and finest
varieties, most of which are in bearing.—Also, a VINEYARD
of one acre of vines in bearing—and two acres of vines, two
and three years old, all of the best and most suitable vari-
eties for this climate.—The STOCK EMBRACES the BEST
COLLECTION of Green and Hot-House Plants in the West
over 50,000 Grape Vines, 1 and 2 years old.—A large and
fine stock of ORNAMENTAL TREES, SHRUBS, &c.—A large
stock of FRUIT TREES of vigorous growth, and embracing
all kinds and varieties grown and sold in this Market.—The
location of this Nursery is in every way desirable, being
near the flourishing City of TOLEDO, OHIO, in the midst of
a fast improving country—with means of transportation
almost unequalled; in fact, possessing advantages in every
particular not excelled in the West.
Address, or inquire of
VON BLESSING & RAY,
Real Estate Agents, No. 7 Lenks Block,
Toledo, Ohio.

SCHOOL TEACHERS WANTED.—The sub-
scriber wishes to employ for each town in the United
States, male teachers who have formerly been engaged either
in Day Schools, or Sunday Schools, who can devote their ex-
clusive time to the business, to canvass for the "Il-
lustrated History of the Bible," by John Kitto, D. D.,
F. S. A., edited by Adrian Bond, D. D., of Norwich, Conn.
This is the best-selling book I have ever published. Agents
make from \$100 to \$300 per month, and say "they never
knew a book to sell so well." Apply immediately in person
or by letter to the publisher.

BEST AND CHEAPEST Self-acting Hand and Carriage Gates. Made by American Gate Company; 55 Bank-st., Cleveland, Ohio. Send for Circulars.

WOOD & MANN STEAM ENGINE CO'S CELEBRATED Portable Steam Engines,

FROM 4 TO 35 HORSE POWER.
ALSO PORTABLE SAW MILLS.

We have the oldest, largest and most complete works in the United States, devoted exclusively to the manufacture of Portable Engines and Saw Mills, which, for simplicity, compactness, power and economy of fuel, are conceded by experts, to be superior to any ever offered to the public.

The great amount of boiler power, fire surface and cylinder area, which we give to the rated horse power, make our Engines the most powerful and cheapest in use; and they are adapted to every purpose where power is required.

All sizes constantly on hand, or furnished on short notice.

Descriptive circulars with price list, sent on application.

WOOD & MANN STEAM ENGINE CO.,
Utica, N. Y.

Branch Office, 96 Maiden Lane, New York City.

Farmers and Gardeners!

Many of you have thus far found the purchase of Garden Seed the most unsatisfactory and most vexing of all your investments. Now, if you will stand by me, I propose to change all this, and make a revolution in the seed business by my three warrants.—1st. I will warrant my seed to be what it purports to be in kind and quality; 2d. I will warrant that the money you send for seed shall reach me; and 3d. I will warrant that the seed you order shall reach you.

Thus, you see, I take all the risks on myself. I know that in doing this I shall make some losses, but I have confidence that the good sense of the farmers and gardeners of the United States will stand by me in this new movement, and so far increase my business, as to enable me to bear all such losses and continue the business on the "three warrants" basis. Stand by me and I will stand by you! Catalogues sent gratis to all. See the advertisement headed "Gregory's Seed Catalogue."

JAMES J. H. GREGORY,
Marblehead, Mass.

A. N. WOOD & CO.

H. B. LANE, 151 Nassau-st.

FLAX.

MALLORY & SANFORD'S IMPROVED

FLAX AND HEMP BRAKES,

As now made, are the strongest and best ever used. They occupy about 5 feet square, weigh about 1,000 lbs., require one man and a boy, and one to two horse power to work them; breaks from 2,000 to 3,000 lbs. Flax straw in 10 hours, taking out 65 to 75 per cent. of the woody matter. This machine will save 120 lbs. to the ton more than any other machine in the world. It will break tangled straw as well as straight. We have also an entirely new TOW SHAKER AND PICKER, works perfectly and does its work quicker and better than any other machine, and prepares the stock for Rope. Also a new TOW COMBER, which cleans and straightens the tow, free from shive, rapidly making it fine and straight. Send for circular or see machines in operation at 93 William-st., New York. Address

JOHN W. QUINCY, Treasurer,
No. 93 William-st., New York.

Stereopticons and Magic Lanterns,

With the Improved Lime Light, illuminating brilliantly two hundred square feet of canvas, and magnifying the views to that size, at an expense of less than one dollar for a whole evening's exhibition. Easily managed and pays well.

SIBERIA OTT, 581 Broadway, New York.

IS WATER
POISONED!!!
BY
LEAD PIPE.

The Manchester (N. H.) Mirror and Farmer, of recent date, notices the death of two citizens of that place by lead poison, from water drawn through lead pipe. They say: "The disease manifests itself in different ways: lead colic, a painful affection of the joints, disease of the brain, as in the case of Mr. Sargent; partial or general paralysis, as in the case of Dr. Tibbets."

The mortality statistics of this city indicate a larger increase of deaths by paralysis, since the introduction of the Croton Water, in proportion to the population, than any other disease of this class. The statistics show THE DEATHS, in 1853, to be 92, population about 575,000, in 1865, 261, population about 1,060,000. The same is true as regards consumption of the bowels, want of action of the kidneys' disease of the heart, etc., etc.

Dr. Hayes, of Boston, says: "Lead, as a material for pipes, cannot safely be used for conducting water which is to be used for domestic purposes," and all the leading Chemists and Physicians of the country assert the same thing.

LEAD ENCASED
BLOCK TIN PIPES,

Entirely prevent water, and other liquids that flow through them, from becoming impregnated with poisonous solutions of lead.

It is the only safe and durable pipe made for domestic use. It costs but little more than lead pipe, and possesses all the mechanical qualities required by Plumbers.

The following distinguished Chemists and Physicians have unqualifiedly endorsed and recommended this pipe for general use:

Prof. Torrey, U. S. Assay Office, N. Y.
Prof. Doremus, College of the City of New York.
Prof. Chandler, School of Mines, Columbia College.
Prof. Draper, University Medical College.
Prof. Horsford, late of Harvard College.
Prof. Silliman, Yale College.
Dr. Hayes, State Assayer, Mass.
Prof. Booth, U. S. Mint, Philadelphia.
Dr. Pohl, successor to J. R. Chilton & Co.
Willard Parker, M. D., Dr. Percy, N. Y. Med. College,
James Anderson, M. D., James R. Wood, M. D.,
Jared Linsly, M. D., Alfred C. Post, M. D.,
Lewis A. Sayre, M. D., F. G. Thomas, M. D.,
James Crane, M. D., M. G. Echeveria, M. D.,
And many others.

We also manufacture

TIN PLATED SHEET LEAD,

For Lining Water Tanks, &c., &c.

For Pamphlets, and further information, address,
The Colwells, Shaw & Willard Mfg. Co.,
(Sole Manufacturers.)

Foot of West Twenty-seventh-st., New York.

THE UNIVERSAL CLOTHES WRINGER

AND

DOTY'S CLOTHES WASHER.

THE UNIVERSAL WRINGER was awarded the First Premium by the unanimous vote of the Committee of the GREAT NEW ENGLAND FAIR of 1866, after the most scrutinizing trial of the various machines of numerous competitors.

It was pronounced superior to all others at the WORLD'S FAIR IN LONDON, 1862.

Took the First Premium at the last two Great Fairs of the AMERICAN INSTITUTE in New York City, 1863 and 1865. At each of the following State Fairs it also received the

FIRST PREMIUM;

NEW YORK.....	1862.	1863
VERMONT.....	1863.	1866
NEW HAMPSHIRE.....	1866	1866
PENNSYLVANIA.....	1863.	1864
OHIO.....	1863.	1865
MICHIGAN.....	1864.	1866
INDIANA.....	1863.	1865
ILLINOIS.....	1863.	1864.
IOWA.....	1863.	1864.
WISCONSIN.....	1864.	1865.
MINNESOTA.....	1863.	1866
MISSOURI.....	1865.	1866
KENTUCKY.....	1865.	1866
CONN. RIVER VALLEY FAIR.....	1864.	1864
CHAMPLAIN VALLEY FAIR.....	1864.	1864
MECHANICS' INSTITUTE, Boston.....	1863.	1863

And at most of the County and Institute Fairs throughout the country where it was exhibited.

The manufacturers WARRANT it FAR superior to all others.

There have been more than half a million UNIVERSAL CLOTHES WRINGERS sold, which amounts to more than those sold by all other makers. We warrant them to be all they are represented to be. They are so well made and durable as to seldom need repairing, and with ordinary care will last many years. Those received for repairs will not average more than one in every two hundred sold. The UNIVERSAL CLOTHES WRINGER has given really universal satisfaction. It wrings clothes almost dry without injury to the most delicate garments.

In selling the UNIVERSAL WRINGER, we find a large demand for a good Washing Machine, and knowing

DOTY'S WASHING MACHINE

to be the best, we bought the patent, and now offer it to the public, knowing that it will give satisfaction wherever used. Doty's Clothes Washer was awarded the FIRST PREMIUM at the GREAT NEW ENGLAND FAIR of 1866, after the most thorough trial with numerous competitors. It has taken the

FIRST PREMIUMS

At the State Fairs of
NEW YORK, PENNSYLVANIA, VERMONT,
MICHIGAN, WISCONSIN, and IOWA.
Also, at the last
GREAT FAIR OF THE AMERICAN INSTITUTE.

A supply of the Wringers and Washers are always kept on hand in Chicago, Cincinnati, Cleveland, Louisville, and St. Louis, boxed ready for shipment, at about New York prices. Circulars, giving wholesale and retail prices, sent free.

Large profits are made selling these Machines. Exclusive right of sale given, with no charge for the patent right.

On receipt of the price from places where no one is selling, we will send one Washer and one Wringer, either or both, free of freight charges. Family Size Washer, \$14; No. 1 1/2 Wringer, \$10; No. 2 Wringer, \$3.50.

R. C. BROWNING, General Agent,
No. 32 Cortlandt St., New York,
(Opposite Merchants' Hotel).

SAVONINE.

NOTICE whenever an article of actual value, and acknowledged as such by the Public, becomes "a Household Necessity," it is a notorious fact numberless counterfeits immediately appear, and claims are made of "priority of invention." An action on this head has already commenced in the Supreme Court of New York. Now, therefore, TAKE NOTICE that any one counterfeiting, or, in any manner, making use of the Trade Mark hereunder, and, duly registered, will be prosecuted, and, without further notice, by the GLAMORGAN SOAP CO.,
45 Broadway, N. Y.

MME. DEMOREST'S BENOITON DRESS
LOOPEES—Convenient, efficient and durable, requiring no sewing, and very ornamental. \$1 per set; sold everywhere, or mailed, post free, on receipt of price. No. 473 Broadway, N. Y.

EXTREMES

MEET.

VERMONT & LOUISIANA. Gothic Furnace vs. Zero Refrigerator.

"Your Furnace gives perfect satisfaction. We warm our Store, 100x25 ft., Carpet rooms in 2d story, and Public Hall in 3d story, 75x40 ft.—none but a powerful Furnace would do this." J. JAY JOSLIN, Poultney, Vermont.

Dec. 12th, 1866.

"LESLEY'S ZERO-Refrigerator has just received the first Premium at the Louisiana State Fair, over all others." Nov., 1866. J. D. STRONG, New Orleans, La.

Courtlandt street, New York, wish to engage some smart young men as country canvassers, to distribute advertisements and to procure orders for their celebrated Poudrette. A liberal commission allowed.

Gregory's Seed Catalogue,

Containing One Hundred and twenty-five varieties that I grew myself, besides many kinds imported from France and England, and grown by the best Seed growers in the United States. Farmers and Gardeners will find in my Catalogue many new and rare vegetables, some of which are not to be found in any other Seed Catalogue. As the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, Boston Curled Lettuce, and many other new vegetables, I invite the patronage of the public. Catalogues sent gratis to all. Those who purchased seed last season will receive it without writing for it.

JAMES J. H. GREGORY,
Marblehead, Mass.

WALTON'S SERIES OF ARITHMETICS

CONSISTS OF

1. Walton's Pictorial Primary Arithmetic.
11. Walton's Intellectual Arithmetic.
111. Walton's Written Arithmetic.

The Pictorial Primary Arithmetic,

On the plan of Object-Lessons, is appropriately illustrated, and presents the elementary combinations of numbers in a series of simple and progressive lessons, calculated to interest and develop the mind of the young learner.

The Intellectual Arithmetic

Forms a connecting link between the Primary and Written Arithmetics, reviewing the former, and illustrating with small numbers nearly all the principles applied in the latter. This book contains also *An Introduction to WRITTEN ARITHMETIC*, and is well adapted to meet the wants of the large class of students who can devote but little time to the study of arithmetic.

The Written Arithmetic,

For Common and Higher Schools, is a thoroughly analytical and progressive work; it presents the science of numbers in a philosophical manner, and affords a more full and varied practice than any other book of its class. Its original and thorough system of reviews commends it to every practical teacher. A distinguishing feature of this Arithmetic is its adaptation to the present wants of business life.

BREWER & TILESTON, Publishers,
131 Washington-street, Boston.

MOTHERS' JOURNAL,

And FAMILY VISITANT.

A Monthly Magazine, for Mothers and the Household. With nothing light or trashy, it is practical in purpose, substantial in matter, attractive in style. To aid Mothers in their noble, but difficult work, and to make the family healthy, happy, useful, and good, is the object of the JOURNAL. Price \$1.50 per year. Five copies, \$7. Single Numbers, 75 cents. Send by mail, directed to "MOTHERS' JOURNAL, 500 Broadway, New York."

Merry's Museum.

The Children's Old Favorite.

THE JANUARY NUMBER, 1867, commences the Twenty-seventh Year of this popular favorite of the young folks everywhere, and is filled with the choicest Stories, Pictures, and Puzzles. In addition to its present unequalled list of writers for that class in America, a number of others have been secured, and no pains will be spared to make it worthy of its reputation of being the best magazine for Young People in the land. Its moral tone will be unexceptionable, and the literary matter interesting and instructive. Valuable Premiums given for obtaining new subscribers. Terms \$1.50 a year in advance. Single copies, 15 cents. Send for it. Address, E. H. FALES, Publisher,
172 William Street, New York.

1867.

10 Copies for \$15.

A NEWSPAPER

Now, as always, pledged to the advocacy of the Great Principles of

Free Soil, Free Speech, Free Labor,
Free Men and Free Trade!

THE "EVENING POST,"

NEW-YORK,

Combines all the essential elements of a

First-Class Metropolitan Newspaper.

ITS LITERARY and MISCELLANEOUS SELECTIONS are prepared with great care, and constitute its chief attractions to the

FAMILY CIRCLE.

ITS SOUND POLITICAL VIEWS on all the great questions of the day recommend it to all who prize

TRUTH ABOVE PARTY.

ITS AGRICULTURAL and HORTICULTURAL articles are full and interesting.

ITS MONEY and MARKET REPORTS are invaluable to Farmers or Country Merchants.

It is printed on entirely new type, and good white paper.

PLEASANT WORDS.

The following complimentary expressions are selected from numerous notices of the recent improvements in the EVENING POST:

Though in its sixty-sixth year, the EVENING POST has all the freshness and vigor of its more youthful competitors. Mr. Bryant's writings have always been its principal charm, and it is gratifying to know that his pen is still as active as ever.—*American Agriculturist*.

The New York EVENING POST is one of the most dignified and able newspapers in the country—a creditable exponent of American thought.—*Albany Evening Journal*.

The New York EVENING POST is one of the soundest, as it has always been one of the ablest and most dignified of American newspapers.—*Rochester Democrat*.

THE EVENING POST is an honor to American journalism. Having definite convictions, and a broad, comprehensive political creed, it is not so much the organ of any party as it is the educator of statesmen. Dignified, direct, and forcible in style, its editorials are frequently models of linguistic purity and elegance. With its political philosophy is allied a practical comprehension, which has secured for the Post a confidence sparingly reposed in journals of a more impetuous or more servile temper. We are glad that a paper so deserving of appreciation as the Post, receives it with ever augmenting measures.—*Christian Intelligencer*.

POSTMASTERS or others acting as Club Agents can learn further particulars on application.

CLERGYMEN are supplied by Mail with the Daily at \$10; Semi-Weekly at \$3; or Weekly at \$1.50 per annum.

REMITTANCES should be made, if possible, by Draft or Post-Office order, payable in New York.

Specimen copies sent free.

WILLIAM C. BRYANT & CO.,

PUBLISHERS,

41 Nassau Street, New York.

REV. HENRY WARD BEECHER,

will furnish REGULAR CONTRIBUTIONS to the columns of

THE METHODIST.

Consisting of Fortnightly SERMONS, and "Lecture-Room Talks," reported expressly for "THE METHODIST," revised by Mr. Beecher, and protected by Copy-right. [These Sermons are now published in THE METHODIST instead of in the Independent, as formerly.]

Also a series of valuable and instructive Sermons, by the most eminent Pulpit Orators of the Methodist and other Churches.

THE METHODIST is an eight-page Weekly Newspaper, now in its seventh year of highly successful publication. It is Religious and Literary; Independent, Fraternal, Loyal and Progressive.

It is Edited, as heretofore, by

REV. GEORGE R. CROOKS, D.D.

Assisted by able Editorial Contributors:

TERMS: \$2.50 per year, payable in advance.

Twenty cents must be added by Subscribers in the British Provinces, to pre-pay postage.

Liberal Premiums are allowed to those forming Clubs of subscribers.

Specimen Numbers sent free, on application.—Address

THE METHODIST,
114 Nassau-street, New York.

THE AMERICAN JOURNAL

OF

HORTICULTURE,

AND FLORIST'S COMPANION,

ILLUSTRATED.

We shall commence with the coming year the publication of an Illustrated Monthly Magazine devoted to Horticulture. For a long time the demand has been felt for a Journal in this department, of high tone and liberal ideas, employing not only the best talent in America, but the selection of all that is good from the English, French, German and other foreign works. This demand we design to supply.

An important and novel feature of the Magazine will be the department of FLORICULTURE. Recelving contributions from all of the known talent in America, with copious extracts from the best foreign works, it will be an Encyclopedia of Floriculture. To the lady who has only a window for her garden, or the front of a city residence, as well as to the proprietor of the largest garden and green-house, it will be a necessary companion and guide. Every novelty introduced will receive proper attention in our columns.

The subscription price will be \$3.00 per annum, so that it may be within the reach of all who desire such a work.

Each number of the magazine will contain 64 pages of reading matter, including illustrations.

THUS IT WILL BE SEEN THAT FOR THREE DOLLARS WE GIVE NEARLY EIGHT HUNDRED OCTAVO PAGES OF ILLUSTRATED HORTICULTURAL MATTER, SELECTED FROM THE BEST THE COUNTRY CAN PRODUCE.

The January number will be ready about December 1st.

TERMS: Three dollars per annum, strictly in advance. Liberal terms will be made with those desiring to form clubs, or to act as agents in enlisting subscribers.

Sample numbers sent by mail on receipt of 20 cents.

Agents wanted in every city and town in the country.

J. E. TILTON & CO.,

PUBLISHERS, BOSTON.

Prospectus with list of contributors, sent on application.

TAXIDERMISTS' MANUAL,

GIVING full instruction in Skinning, Mounting and Preserving Birds, Animals, Reptiles, Fishes, Insects, Eggs, Skeletons, &c. Sent by mail, postpaid, on receipt of \$1.00.

Address S. H. SYLVESTER, TAXIDERMIST,
Middleboro', Mass.

BOOK AGENTS WANTED.—Agents are now wanted to solicit orders in each town in the United States, for *The Illustrated History of the Bible*, by John Kitto, D. D., F. S. A., Edited by Alvan Bond, D. D., of Norwich, Conn.

This is the best selling book now published. Agents make from \$100 to \$300 per month, and say "they never knew a book to sell so well." For further information apply immediately to the publisher, HENRY BILL, Norwich, Conn.

THE HOG BREEDERS' MANUAL tells you how to cure Hog Cholera, and all diseases of Hogs, only 25 cents. Address N. P. ROYCE & CO.,
Gum Tree, Chester Co., Pa.

AGENTS WANTED everywhere for "Phillips' Excelsior Sticking Paper." Send 2 red stamps and get sample and terms. L. W. PHILLIPS, Et. Bridgewater, Mass.

THE NEW YORK LEDGER FOR 1867.

A Story by Henry Ward Beecher.

IT HAS BEEN OUR CUSTOM, AS OUR READERS are aware, to engage, as contributors to the *New York Ledger*, some of the most distinguished persons in the literary world, not only in this country, but also in Europe. As a proof of this we have only to refer to EDWARD EVERETT, CHARLES DICKENS, GEORGE BANCROFT, HENRY WARD BEECHER, and others, who, as it is well known, have been writers for the *Ledger*. A feature of the coming year will be a story by the Rev. HENRY WARD BEECHER, written expressly for the *Ledger*, which will extend through several months. In addition to this new feature, we shall continue to give the usual quantity of matter from our old and unrivalled corps of contributors.

The *Ledger*, however, as we stated on a former occasion, is its own best advertisement and prospectus. The mere fact that we are printing over one hundred thousand copies more than any other weekly or daily paper in the country is proof enough of the value of the *Ledger* as a popular paper. Its great success, as we have repeatedly announced, is owing to the fact that we spare no expense in getting up the BEST FAMILY PAPER—a paper of high moral tone. The exalted reputation of its contributors, the practical and invariably pure and healthy character of all its articles, the care which is taken that not even one offensive word shall appear in its columns, and the superiority of its Tales and Sketches, have gained for the *New York Ledger* a position that no literary paper has ever before reached.

—MRS. SOUTHWORTH, MR. COBB, MISS DEPUY, FANNY FERN, JOHN G. SAXE, and a host of other popular writers, are exclusively engaged in writing for the *New York Ledger*. They each stand high, and have their admirers in their own peculiar line, and that is the reason why we monopolize their services. We make the best paper by employing the best talent.

—We are certain that our readers will be glad to learn that MR. PARSONS will continue to contribute to the *New York Ledger*, during the coming year, his admirable biographical sketches. They are both entertaining and instructive.

FANNY FERN, who has been with us from the start, will continue to write for the *New York Ledger* during the coming year. She writes for no other paper.

—JOHN G. SAXE, the most popular poet in the country, writes only for the *New York Ledger*.

The following are some of the opinions of the press:
[From the New York Daily Times.]

A Novel by Henry Ward Beecher.

REV. HENRY WARD BEECHER is announced in still a new capacity. He has engaged to write a novel for the *New York Ledger*, and in a note to Mr. BONNER informs him that he "hopes to put enough manuscript in his hands to enable him to begin the story early in 1867." Next to the exhaustless vigor and restless industry which distinguish Mr. BEECHER, his resolute readiness to undertake any line of business, however remote apparently from his ordinary line of labor, is the most remarkable. The more he has to do, the more readily does he seem to undertake new tasks. This last advantage will be watched for with interest. The great success of his sister, Mrs. STOWE, in that department of literature, will invite and provoke the severest criticism; and if he aim at literary rivalry, either with her or the many other novelists whose works now engage public attention, he has certainly entered upon a task of danger and difficulty. Mr. BEECHER, however, is not apt to undertake anything which he cannot do well. His resources are abundant, and his intellectual vigor is equal to his courage. We are not aware of the subject or character of his promised story. Mr. BONNER, in securing this new and unique contribution to his columns, is continuing the original and brilliantly successful career which he commenced some years ago.

[From the "Prince Georgian," of Marlborough, Md.]

THE NEW YORK LEDGER.—The numerous readers of this popular journal will be gratified to learn that Mr. BONNER, its energetic editor, has engaged the Rev. HENRY WARD BEECHER to write a story for his paper. By the last issue of the *Ledger*, we learn the whole arrangement has been perfected, and that the publication of the tale will be commenced early in the New Year, and extend through several months. The fame of Mr. BEECHER, as a great and a public writer, is too widespread to need further mention from us, but we trust that the energy of Mr. BONNER, who, since the commencement of his journal, has catered so successfully to the public taste, will, in this instance, as heretofore, bring him a rich and deserved reward.

[From the Fincastle (Va.) Herald.]

REV. HENRY WARD BEECHER is writing a story for the *New York Ledger*, which will commence about the 1st of January next. A story from this eminent and gifted divine, unconnected with politics, as doubtless it will be, we think will prove very interesting to the reader. We advise all persons who wish to obtain a splendid literary paper, to subscribe for the *Ledger*, as there is no paper in the United States that can boast of as good authors as it can.

[From the Mining and Manufacturing Journal.]

NEW YORK LEDGER.—This enterprising literary paper, always foremost in securing something valuable for its wide circle of readers, has engaged HENRY WARD BEECHER to write a story for it, which will continue during the several months of next year, beginning in January.

[From the Philadelphia Ledger.]

MR. BONNER, the editor and proprietor of the *New York Ledger*, who is ever alive to keep his paper ahead of all competition, has just made an arrangement—the engagement of HENRY WARD BEECHER to write a story for his paper—which must add to his already enormous circulation.

[From the Hudson County (N. J.) Democrat.]

Why should not the Rev. Mr. BEECHER write a story? In the best of books we are taught by parables and allegory; and Mr. BEECHER has imagination, and wit, and judgment, with a brilliant, attractive style of composition, which give promise of eminent success.

[From the Hartford Daily Post.]

MR. BEECHER's story will unquestionably be looked for with great interest. The circulation of the *Ledger* is now larger by one hundred thousand copies than that of any daily or weekly paper in this country.

[From the Essex (Mass.) Banner.]

The *New York Ledger*, which is universally conceded to be the best story paper in this country, is constantly producing new attractions. The "best productions of the best authors" is what the *Ledger* always has.

[From the Portsmouth (N. H.) Morning Chronicle.]

The *New York Ledger* always has something nice for its readers, and Mr. BONNER has proved that he cannot and will not be bent as a caterer for the public taste.

[From the Sandusky (Ohio) Union.]

The *New York Ledger*, which, as a literary journal, is, without question, ahead of all others, will be still more attractive for 1867.

OUR TERMS FOR 1867—NOW IS THE TIME TO SUBSCRIBE.

Single copies, \$3 per annum; four copies, \$10, which is \$2 50 a copy; eight copies, \$20. A party who sends us \$20

for a club of eight copies, (all sent at one time,) will be entitled to a copy free. Postmasters and others who get up clubs, in their respective towns, can afterwards add single copies at \$2 50. No subscriptions taken for a less period than one year. Canada subscribers must send twenty cents in addition to the subscription, to pay the American postage. When a draft or money-order can conveniently be sent, it will be preferred, as it will prevent the possibility of the loss of money by mail. The postage on the *Ledger* to all parts of the country is only twenty cents a year, or five cents a quarter, payable at the office where the paper is delivered.

We employ no travelling agents. Address all communications to
ROBERT BONNER, Publisher,
No. 99 Beekman street, New York.

IONA AND ISABELLA

[Continued from next page (36), which see.]

And the wine from the Delaware, although most excellent of its class (resembling the alcoholic Sherry), was too rich and "heavy," or intoxicating for general use. It could not supply the want that is felt for the finest German Wines, which are more healthful and restorative, but less stimulating, and though greatly coveted, are but rarely obtained in this country. Their use is greatly restricted by their exceeding costliness.

The following from Mr. Mottier, will be conclusive for wine making to those who know his cautious manner of forming and expressing opinions, and his ability to judge.

DR. C. W. GRANT,—

Dear Sir: I have to express to you my very great satisfaction at the trial of the Iona Wine, and also of the Juice. The Wine of 1864 was far better than any American production that I ever tasted, of that age, and I think equals the very finest Hocks of Germany. That of this fall that has just finished its fermentation, I think, promises at least equally well. I never doubted the great excellence of the Iona for Wine—its fruit plainly indicates that; as it appears to me now, it is of the very highest promise, and I shall plant very largely of it.

Signed, (Yours, respectfully,

JOHN E. MOTTIER.)*

The must (juice) of the IONA has registered by the scale from 88 to 130 degrees, where that of Catawba could scarcely rise above 70, and the wine at two years old, is able to bare comparison in pure refinement and all good qualities, with the most excellent of Europe, at that age. While this can be said of no other American Wine, except that of the Delaware, there is a general concurrence among good judges in awarding great superiority to the IONA over that. In purity and richness, it equals the Delaware, and greatly excels it in sustaining and restorative power, without the strong disposition to intoxication, from which the Delaware is not exempt. It has been well characterized as "generous and animating, smooth, rich, refined and pure, leaving the mouth cool and the head clear, in no degree heavy or oppressive, with delightful bouquet, and not a trace of native foxiness."

Its juice never requires sugar or any admixture to prevent acidification, and the wine is most simply made, requiring only that its juice should be pressed and set to ferment in an open vessel, either in a warm upper room or cellar. It is so fixed and enduring in its character that it does not require a cellar to keep it from acetous fermentation, and a little of its rich juice added to that of Catawba, prevents the disposition of that to form vinegar, and adds greatly to its refinement and richness.

An all important characteristic that belongs to the IONA, it may be said alone, of all our native kinds, is its habit of ripening thoroughly and uniformly, quite to the center, and as soon at the center as at any other portion. To say that this characteristic added to the Catawba, would tenfold its value for wine, and change its character entirely for the table, is saying less than the fair plain truth. The Catawba, merely for the want of this one of the peculiar characteristics of the IONA, must become of little value as soon as enough vines of the IONA can be planted to supply its place.

But the IONA has other exclusive characteristics of exceeding importance. Its skin is pleasantly spicy and good to eat, in place of the acrid foxiness of the Catawba. Its juice is perfectly pure, smooth to the tongue, in place of the harsh impurity of the Catawba, (our other natives being greatly more harsh and impure,) at the same time greatly exceeding it in richness. It ripens three weeks earlier, and is exempt from rot, where the Catawba is rendered worthless by it. I leave all that are inferior to the Catawba out of the comparison.

The planting of vines in vineyards as well as in gardens, is now being so extensively done, that we are called upon to look attentively and intelligently at the conditions of profit and success in the undertaking.

It is only in the production of good articles of any kind that it is safe to put trust for permanent profit, and especially if the good are greatly better than the inferior, and cost no more.

The best varieties of grapes which we designate as European (but originated in Asia), differ greatly from our ordinary American kinds in their quality, and in the construction or physical character of the fruit. In order to get a true notion of the Grape as the best of fruits, which it truly is in its best kinds, in perfect condition, it will be necessary to note the prominent points of these somewhat critically that we may bring them in our minds into just comparison with our own kinds. This will enable us rightly to estimate the value and importance of some of our new varieties

* (Mr. Mottier has already taken Six Thousand vines of IONA this Fall, and expects to take more in the Spring.)

(when we know also the habit and character of the vines), both for fruit and for wine.

The skins of the foreign kinds generally grow inseparably fast to the flesh, but are good to eat, and the flesh or substance of the berries ripens uniformly from the circumference to the center, and the entire substance is equally rich and good. This fruit is eaten, and all the substance deliberately enjoyed in the mouth, instead of being swallowed chiefly whole, and in the rich spirited kinds, it is literally eating wine. All persons who have had knowledge of these, have most earnestly desired their cultivation in this country, for their pure, rich, animating spirit, and for their exquisite refinement of flavor.

But these can be grown only in expensive glass houses in this country.

In contrast to these, the skins of American grapes let the fruit slip out from them when burst by pressure, like a bullet from a gun. The skins are too unpleasant for eating, being sharp and acrid to the lips, with the offensive odor of the excreta of the Fox. There is always a tough, unripe acid portion in which the seeds are imbedded, that must be swallowed whole like coated pills. The only portion which ripens is that between the skin and bullet center, and even this portion, as in the Catawba and Isabella, is neither refused or rich in flavor, when compared with Fontignan or Muscat of Alexandria, which are equally good from circumference to the center.

To say that a grape is as good as Muscat of Alexandria, is to give it the highest possible commendation, and this is certified of the IONA. Both are raisin grapes.

It is equally important that grapes for making good wine should be pure and refined in flavor, without any foxiness or unripeness at the center, and indispensable that they should be high flavored and spirited.

The stories of high prices for wine from Concord and kindred kinds, are doubtless true to the letter, but tend to propagate notions of great and disastrous antrath.

(These may seem to be minute details, but they show the only foundation upon which Grape Culture can permanently stand. Continued next month. For Pamphlet in which the subject is treated at length, send stamp.)

A Grape Book for the Million.

The Subscriber has been induced to undertake the preparation of a Book on the Cultivation of Grapes, with the aim to make the subject more simple and easily intelligible than has heretofore been done, by removing from it all extraneous matters, and giving only the plain essentials of full success. This is to invite communications on the subject, stating important facts that may have transpired in individual experience, concerning any variety worth noting, and especially in relation to the new varieties, and from districts where the cultivation is less known.

R. G. PARDEE, New-York.

No. 218 West 34th-st.

PERUVIAN GUANO SUBSTITUTE!

BAUGH'S
RAW BONE
Super-Phosphate of Lime.

MANUFACTURED under the formula originated in 1854, and patented by

BAUGH & SONS,

SOLE PROPRIETORS, AT THE

Delaware River Chemical Works,

PHILADELPHIA, U. S. A.

The most highly concentrated, speedy, permanent, and cheap manure in the market, used by thousands of farmers in the Atlantic, and by Planters in all the Southern States, with remarkable success, upon

COTTON, CORN, TOBACCO AND ALL CROPS.

Pamphlets containing well known Southern evidence furnished upon application to New York or Philadelphia offices.

Sold by Dealers in all the principal Cities and Towns throughout the United States and the British Provinces.

BAUGH, BROTHERS & Co.,
General Wholesale Agents,
181 Pearl-street, New York.

Sent Free, three Months for Nothing.

The great AMERICAN STOCK JOURNAL—THE FARMERS' AND STOCK BREEDERS' ADVERTISER, the Oct., Nov. and Dec. numbers, of 1866, sent free to all Subscribers for 1867, only \$1.00 a year in advance. Each number contains 32 large double-column pages. Illustrated with numerous Engravings. Send stamp for specimen copy and circular, with list of splendid Premiums to Agents.
Address N. P. BOYER & CO., Gum Tree, Chester Co., Pa.

(Business Notices \$2.50 per Agate Line of Space.)

THE GREAT AMERICAN TEA COMPANY ALWAYS A WHOLESALE ESTABLISHMENT.

We have many enquiries (10 to 20 letters a day) asking what discount we make to the Trade from our prices as published in the PRICE LIST. These are our *lowest wholesale prices*. We consider ourselves only a Wholesale Corporation, and we have but *one price*.

The way in which we came to break packages at all, was that during the high prices of Teas we furnished parties with packages as small as five pounds. Our fame spread far and wide; and parties with small means thought it very hard to be compelled to pay, elsewhere, about a *dollar* per pound more than we were selling the same goods for, simply because they could not afford to buy five pounds of us at one time. Therefore, in order to lighten these burdens, we consented to supply their wants in quantities as small as one pound at the wholesale prices.

Parties of small means wishing for goods to sell, can have their orders put up in small packages to suit their trade, but we cannot make any reduction in price, as our profits for the last six years have not averaged more than *two cents per pound*.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lots at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for *all the profit he can get*.

When you have added to these *eight* profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

The Company have selected the following kinds from their Stock, which they recommend to meet the wants of Clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the List of prices will show.

All goods sold are warranted to give satisfaction.

PRICE LIST:

YOUNG HYSOON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

MIXED, 70c., 80c., 90c., best \$1 per pound.

JAPAN, \$1, \$1.10, best \$1.25 per pound.

OOLONG (Black), 70c., 80c., 90c., best \$1 per pound.

IMPERIAL (Green), best \$1.25 per pound.

ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

GUNPOWDER (Gunpowder), \$1.25, best \$1.50 per lb.

The most convenient club forms are shown in former editions of this paper.

P. S.—All towns, villages, or manufactories, where a large number of men are engaged, by clubbing together, can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,
31 and 33 VESSEY-STREET, corner of Church.
Post Office Box, 5,643 New-York City.

We call special notice to the fact that our Vessey Street Store is at No. 31 and 33 Vessey Street, corner of Church Street—large double store.

Parties looking for our store will please bear in mind that ours is a large double Store, Nos. 31 and 33 Vessey Street, corner of Church-street. This is an important fact to be remembered, as there are many other Tea Stores in Vessey St.

IONA AND ISRAELLA VINES FOR SPRING PLANTING.

Besides my general stock of Vines for Garden and Vineyard, which are of unequalled quality, I have some that have been reserved for spring planting, that greatly surpass in quality any that I have heretofore offered in quantity.

A full description of these will be given in Spring Price List, which will be ready before the 1st of January.

There are a few important facts in relation to my present stock of IONA and ISRAELLA vines which are of great interest to all purchasers who desire to secure the best and cheapest plants.

The past season, from its sudden changes, was the most unfavorable for the production of plants of good quality, and propagators have experienced very great disappointment generally.

The principal portion of my stock was started very early for the purpose of making plants of unusual quality, and were, at the time of the June cold, advanced to healthy endurance, so that they received but little check, and before the cold of August, had made a strong mature growth, that carried them safely through the season. Hence, although the season was the most unfavorable ever experienced, I am able to offer better and cheaper vines of these kinds than were ever before grown in open air.

I have besides a large stock of vines that were grown in houses all the season. These also challenge competition.

My vines of this class have given universal satisfaction, and have never been approached in quality by those of any propagator. Those of this season excel my former productions, and are the natural result of proper management. The Houses are of unusual construction, and are made to admit the full force of the sun, and so thoroughly ventilated as to equal the effects of full exposure, except in times of trial by cold, or tearing winds—that are greatly detrimental to any vines, but lightly damaging to young ones. They were also grown at large distances apart, the open spaces amounting to one foot or more and exceeding by more than four-fold the ordinary distances of the best plants. The roots are proportioned to the distances, as were also the leaves. **Such plants can be very cheap** without being very low-priced, and they can not be produced without great cost.

I offer a fine lot of wood, from strong and perfectly healthy Iona and Israella vines, for propagation. For descriptions and price send for spring price list.

I may here say, that all of my vines are offered at a very small living profit, and I do not hesitate to warrant that at the prices asked, they will be found to be much cheaper than any that have been or can be sold at Auction this season. The proposition to be solved and being solved daily, where the value of good grapes is well understood, is like the following. How much cheaper is a vine at 25 cents, that at the end of the third season has given no return, than one for \$2.00 that has given \$5 for its fruit, and \$3.00 for its cuttings.

Send two-cent stamp for present state of Grape Culture, and Price Lists for 1867.

C. W. GRANT, Iona,

(near Peekskill), Westchester Co., N. Y.

P. S.—I again invite all interested to call and inspect the vines at Iona. The visit has its dangers. Let one marked instance suffice for example and warning. One—of great firmness of character too, came resolved to not buy. He bought 12,000 Extra Iona Vines for his own planting. (If he wishes he can have my guaranty that it will prove the cheapest large lot ever purchased in the country.) Many have been overcome in the same way to the amount of thousands. I also offer Iona wine for inspection.

The Present State of Grape Culture.

The past has been acknowledged, by general consent, to have been the most unfavorable season for Grape Culture, (both for the propagation of plants and production of fruit,) that has occurred since these became an important branch of cultivation, and more interest from those that are alive to the importance of the subject, has centered in the IONA, than in all of the other kinds, for that is the only one before the public that has promised, by its assemblage of excellences, to make our country eminent in grape producing for all purposes.

If this were to come short in any important point of the high expectations raised by its past history, it would be an astounding disappointment. From a very extended survey, we shall see that it has fully **sustained its high promises in every particular**, although vines have failed in some instances from improper treatment.

It is true, there have been instances of failure of the vines from being frozen out, as of all other kinds, from a vicious plan of planting, but in no instance within my knowledge, where the simple directions of the Manual have been followed. Of that I shall treat farther soon.

Three years ago it had begun to be clearly apparent to those who were most intimately acquainted with grapes,

and who were also most thoroughly conversant with vine culture throughout this country and in Europe, that the IONA was the grape to complete the revolution both for Fruit and for Wine, that had been already well undertaken by the Delaware.

The richness, purity, and refinement of flavor of the Delaware, apparently left little to be hoped for, better in these respects. As a fruit, it was exquisite, and its wine was of a rich, refined character, heretofore unapproached by the productions of this country. The Catawba, before the introduction of the Delaware, had justly stood high above all other Native kinds, both for Fruit and for Wine, but with strong points of excellence, it had very great and radical defects for both purposes, in the quality of its fruit as well as in the habit and character of the vine.

Its Southern origin, and consequent lateness in ripening and sensitiveness to atmospheric changes, inducing mildew and rot, restricted its cultivation to a very narrow limit, and then in only a few favored localities could its fruit be hoped for with any degree of constancy that rendered its cultivation valuable commercially, or worthy of much attention in the Fruit-garden.

In addition to these discouragements, were the serious defects in the fruit itself, when in best condition—it always having a large, tough, unripe acid portion, that must be swallowed together with the seeds—and quickly to avoid its unpleasantness.

The better portion, too, had always some astringency from excess of Tannic-acid, and the skin was somewhat acid with a considerable degree of disagreeable and unwholesome foxy odor, even under the most favorable influences of season and climate. As a fruit, it could measurably satisfy the cravings of persons who had known nothing better, but was not good enough to afford much, if any, enjoyment to those who had known the real excellence of Grapes, as existing in the best foreign kinds.

As a Table-grape, the Isabella was always associated with the Catawba, but by its earlier ripening, it was adapted to a much more extended region.

The native defects in this were the same as those in the Catawba, but with much less of excellence, the Isabella being comparatively feeble-flavored—that is, having in a given quantity of juice, less sugar, and what is more important, less of the acids that are indispensable constituents of good grapes. The acids of unripeness in the tough, unripe center are not here intended, for these are the bane of our ordinary natives, and especially for wine-making.

The Isabella has thus too little richness for making real wine—while the Catawba in its best condition, as cultivated in some favored localities, produces wine of good quality, that has, like the grape, strong points of excellence, with its very positive native defects—in unpleasant aroma, and want of refinement. Mr. John E. Motier, has exhibited the best Catawba wine probably that the grape is capable of producing, in the vintages of '59 and '63, and our comparisons are made with that.

These two kinds had led a large portion of our people to a knowledge of much better grapes than the wild ones of the woods, and Catawba wine, had given a good idea of an exhilarating and refreshing beverage, with little tendency to intoxicate. But the adulterated imitations (falsely represented as pure Catawba, because of the alcoholic strength being added in the form of sugar,) had been manifold more in quantity than the pure wine.

The strong desire to have grapes and wine acting constantly had induced some progress; yet, the advance had been slow, because no grape had appeared of the requisite quality and character to bear comparison with the best of vine-growing countries.

But after the propagation of the Delaware had been undertaken in earnest, as rapidly as plants for the purpose could be supplied, the knowledge of good grapes was spread abroad over the country. At the time we have named (three years ago), the Delaware, which had been extensively disseminated, had borne much of its fine fruit, and made great progress in "educating the American taste," and those who had been foremost in learning from the Delaware how good grapes can be, were ready to take the IONA from the same recommendation, although the originator hesitated then to represent it as surpassing the Delaware in excellence of quality. The claim for it was, that it "deserved to stand by the side of the Delaware for quality, while in size of bunch and berry, it greatly exceeded it." Without detracting at all from the merits of the Delaware (it has not been over-praised), it is now by extensive trial, clearly established by the most abundant proof, that the IONA surpasses the Delaware in quality, for Wine and Fruit, as well as in its bright transparent beauty, and in the large size of its bunches and berries, and in addition that it is an excellent raisin grape, and *our only one that has sufficient richness of substance for that purpose*.

The Delaware was one of the greatest accessions to our enjoyment in fruits, and must ever maintain a very high position.

But a table grape as pure and refined as that, and more "spirited and exhilarating," and much larger in size for full free use, was yet wanted, that would ripen *thoroughly to the center*, which was not the case with the Delaware. [Continued on preceding page (35) which see.]

THE AMERICAN
AGRICULTURAL ANNUAL for 1867.

A New Year-Book,

CONTAINING

AN ALMANAC,

Hints About Work for Each Month,

Recent Progress in Agriculture, and

A Review of the Past Year, together with numerous very valuable contributed articles, and convenient Tables.

The Essay on Draining, by Col. Waring, Engineer of the Drainage of the N. Y. Central Park, is by far the most complete presentation of the subject which has been made for many years in this country.

Some of the Newest and Best Potatoes, with his own mode of culture, are described by one of the most successful cultivators of Westchester County, N. Y., Wm. S. Carpenter.

The Culture of Sorghum, with the latest views in regard to the production of Syrup and Sugar, is discussed by Wm. Clough, Esq., Editor of the Sorgho Journal.

How to Train the Horse.—Mr. Headley's Hints on Training and his Views in regard to his Mind and Temper deserve the attention of every horse owner.

The Culture of Wheat, is discussed practically and philosophically, by Mr. Harris.

John Johnston's Practice in Fattening Sheep, like every thing from his ripe experience, is very valuable.

Essential Features of a Good Barn.—Dr. F. M. Hexamer consults durability in the structure and economy in farm labor, security of crops, health and comfort of stock, in this admirable plan.

The above are but a few of the articles comprised in this little volume—and which make it not only

A Record of Past Progress and Experience—but

A Hand-Book for the Present—and

A Guide for the Future.

This volume is the first of a series which we expect to issue annually, intending to make them a record of what happens each year best worth knowing and remembering, pertaining to Agriculture, in a convenient form for preservation and reference.

Price, fancy paper covers, 50 cts.; cloth, 75 cents.
Sent Post-paid.

NEW YORK:

ORANGE JUDD & CO., 41 Park Row.

THE AMERICAN
HORTICULTURAL ANNUAL for 1867,

A Year-Book for the Gardener, The

Fruit Grower and the Amateur.

NOW READY.

This is the first of a series of Annals intended to give a record of Horticultural progress.

IT CONTAINS

An Almanac and Calendar for each MONTH, giving Hints for Work in the various departments.

Useful Tables, giving amount of Seed to sow a given space; number of Seeds to the ounce, etc.

How Horseradish is Grown for Market, by Peter Henderson. An article worth the price of the work to the grower for market.

Growing Grape Vines from Cuttings without Artificial Heat, by a simple process.

Home Decorations, IVY, HANGING BASKETS, etc. Instructions for the making, planting and management of these beautiful ornaments by A. Bridgeman.

The New Apples of 1866.—The new varieties first brought to notice the past year; as also Southern kinds first fruited at the North, by Doct. J. A. Warder.

New or Noteworthy Pears.—A valuable article, by P. Barry.

Native Grapes in 1866, from Notes furnished by Charles Downing, Geo. W. Campbell, J. A. Warder, A. S. Fuller, and other grape growers.

Small Fruits in 1866.—Accounts of new varieties and older ones not yet fully tested. By A. S. Fuller.

The Newer Garden Vegetables.—The result of experiments with new culinary plants, by Fearing Burr, Jr., J. J. H. Gregory, and others.

The Rarer Evergreens that have proved Valuable.—By Thomas Meehan.

The New Roses in 1866.—Brief descriptions of the novelties, by John Saul.

New Bedding and other Plants of 1866.—An account of how the recent importations have done the past year, by Peter Henderson.

The New Varieties of Gladiolus.—All the new ones noticed, by George Such.

Engravings of Fruits, Flowers, etc.—A useful list of those published in 1866.

Horticultural Books and Periodicals in 1866.—A list giving title, publishers name and price.

Nurserymen, Seedsmen and Florists.—A list of the most prominent Establishments.

With many other articles not here enumerated.

Fully Illustrated,

with Engravings made especially for the work.

A neat volume of 150 pages. Price, fancy paper covers, 50 cents; cloth, 75 cents. Sent Post-paid.

NEW YORK:

ORANGE JUDD & CO., 41 Park Row.

A NEW WORK.
GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

In the last chapter, the most valuable kinds are described, and the culture proper to each is given in detail.

NOW READY. 12 mo., 241 pp. *Finely Illustrated.*
SENT POST-PAID. PRICE, \$1.50.

NEW BOOKS.

**Saunders' Domestic Poultry.**

By S. M. SAUNDERS.

New Edition Revised and Enlarged.

This Book contains Articles on the Preferable Breeds of Farm-Yard Poultry, Their History and Leading Characteristics, with Complete Instructions for Breeding and Fattening, and Preparing for Exhibition at Poultry Shows, etc., etc., derived from the Author's Experience and Observation.

The work is compact, full of valuable hints and information, and beautifully illustrated.

An appendix contains an account of *Poultry breeding on a large scale*, as practiced in the neighborhood of Paris, and is a very important addition to the work.

Price, paper 40 cts., cloth 75 cts.

ORANGE JUDD & CO., 41 Park Row.**Money in the Swamps.****PEAT! PEAT! PEAT!****FUEL—MANURE.****WHERE TO FIND IT.****HOW TO MAKE AND USE IT.****ITS VALUE.****A NEW WORK ON PEAT, THOROUGH AND PRACTICAL;**

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of **PEAT, MUCK, etc.**, telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc. and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

SENT POST-PAID, - - - PRICE \$1.25

ORANGE JUDD & CO., 41 Park Row.**HINTS TO HORSE-KEEPERS,**

A COMPLETE

MANUAL FOR HORSEMEN.

BY THE LATE HENRY WILLIAM HERBERT.

(FRANK FORESTER.)

Beautifully Illustrated.**HOW TO BREED A HORSE.—**

CHOICE OF STALLION.—National Value of the Horse—The best class of Horses the cheapest for all purposes—What constitutes excellence—Blood: what it gives; should be on the side of the Sire—Breed up, not down—Diseases and Defects Hereditary—General Rules.

CHOICE OF THE MARE.—Size, Symmetry and Soundness more important than Blood—Points of the Brood Mare—Diseases Hereditary—Condition of the Mare—Should have moderate work when with Foal—Food and care during gestation—Health and temper.

MUTUAL ADAPTATION OF SIRE AND DAM.—First consideration in improvement of "cold" Blood—Relative size of Sire and Dam—Defects in either Parent—How Remedied in Progeny—Bloods which "hit."

CANADIAN BLOOD.—The Canadian originally the French Norman—Characteristics—Hardihood—Speed—Mode of Improvement—Crossing with Thorough-breds.

NORMAN BLOOD.—Origin and History of the Percheron Norman—A pure race—Characteristics and Points.

MODERN ARAB BLOOD.—English and American Thorough-breds derived from Oriental Blood—are now superior to the Modern Arabs—Nolan Arab.

PONIES—DIFFERENT BREEDS,

CHARACTERISTICS AND UTILITY.—Origin—Different Breeds—Shetlands and Scots—Galloways and Narragansetts—Mustangs and Indians—Profit of raising Ponies.

HOW TO BREED MULES.

Value of Mules—Their History and Natural History—The Mule and Hinny—Thorough-blood wasted in the Dam for Mules—The Mule in the United States—Large size not desirable—Varieties of the Ass—The kind of Mares to be selected.

HOW TO BUY A HORSE.

Of whom to Buy it—Extraordinary Cheapness and Extraordinary Excellence not consistent with each other—Points to be regarded—How to Examine the Eye—Broken Wind—Roaring—Whistling—Broken Knees—To examine the Legs—Splints—Damaged Back Sinews—Spavins—Ringbones—Curbs—How to tell the Age of a Horse.

HOW TO FEED A HORSE.

Consequences of Improper Feeding—Different Food for different conditions—Food for the Brood Mare—for the Foal—for Working Horses—Green Food—Carrots—Corn—Feeding Horses in Training—While Travelling—Summering Horses—The Best Method—Management of Omnibus Horses in New York.

HOW TO STABLE AND GROOM A HORSE.

Requisites for a good Stable—The economy of Proper Arrangements—Ventilation—Grooming: its necessity for all descriptions of Horses—How Performed—Clothing—Treatment when brought in from Work.

HOW TO BREAK, AND USE A HORSE.

What is required in a well-broken Horse—His education should commence when a Colt—Bitting—Putting in Harness—How to Use a Horse—Travelling—Working—Pleasure Horses—Punishment.

HOW TO PHYSIC A HORSE—

SIMPLE REMEDIES FOR SIMPLE AILMENTS.—Causes of Ailments—Medicines to be given only by the order of the Master—Depletion and Purging—Spasmodic Colic—Inflammation of the Bowels—Inflammation of the Lungs—How to Bleed—Balls and Purgatives—Costiveness—Cough—Bronchitis—Distemper—Worms—Diseases of the Feet—Scratches—Thrush—Broken Knees.

FARRIER, ETC.

Castration—Docking and Nicking—Blood-letting—Treatment of Strains and Wounds—Galls of the Skin—Cracked Heels—Clipping and Singeing—Administering Medicines—Diseases of the Feet.

HOW TO SHOE A HORSE.

Unskillful Shoers—Anatomy of the Foot Illustrated—The Foot of a Colt—Preparation of the Foot—Removing the Old Shoe—Paring the Foot—The Shoe—Fitting the Shoe—Nailing—Number of Nails—Diseases of the Foot.

BAUCHER'S METHOD OF TRAIN-

ING HORSES.—What Constitutes a Well-trained Horse—To make him come at your call—The Philosophy of Training—Flexions of the Jaw—Flexions of the Neck—Flexions of the Croup—Backing—The Paces—Leaping.

HOW TO RIDE A HORSE.

The Saddle—The Girths—The Stirrups—Saddle-Cloths—The Crupper—The Martingale—The Bridle—Spurs—Mounting and Dismounting—The Seat—The Hands—The Legs—The Paces—Hints for Special Cases—The Art of Falling—Riding with Ladies.

LADIES' RIDING—WRITTEN BY

A LADY.—Learning to Ride—The Side-saddle—The Girths—The Stirrup—The Bridle—The Martingale—The Bit—The Dress—Mounting and Dismounting—The Position—The Hands—The Leg and Whip—Accidents.

HOW TO DRIVE A HORSE.

The Art of Driving—Pleasure Driving—How to Hold the Reins—Driving a Pair—Four-in-hand Driving—Driving Working Horses—Flowing—Three-a-breast.

RAREY'S SYSTEM OF HORSE-

TAMING.—Rarey's System a New Discovery—Previous System—Principles of this System—Instructions for practicing Rarey's Method—To Stable the Horse—To Approach the Horse—Tying up the Leg—Laying the Horse Down—Final—Vices and Bad Habits—Rearing—Kicking—Baulking—Pulling on the Halter—Shying.

VETERINARY HOMOEOPATHY.

Principles of the System—Table of Remedies—General Directions—Treatment of a Sick Animal—Diet—Remedies for Specific Cases—Glossary of Diseases.

12mo. 425 p.—Sent by mail post-paid. \$1.75.

ORANGE JUDD & CO.,

41 PARK ROW, NEW-YORK.

**New Book of Flowers.**

By JOSEPH BRECK, Practical Horticulturist.

Beautifully Illustrated.

This work, while preserving scientific accuracy, is written in a familiar style, and with the enthusiasm of a life-long lover of flowers. Its teachings are eminently practical, and cover all branches of out of door gardening.

Bulbs.

The cultivation of bulbs, whether in-doors or in the open ground, is clearly described, and such instructions are given as will insure success with these favorite plants.

Annuals.

All the finer annuals are described, and the peculiar treatment necessary for each given in full.

Herbaceous Perennials.

This justly favorite class of plants is given here more at length than in any work with which we are acquainted.

Bedding Plants.

The treatment of the popular kinds of bedding plants is given, together with that of Dahlias, Chrysanthemums and such as usually fall under the head of florist's flowers.

Flowering Shrubs.

A separate section is devoted to the hardy flowering shrubs, including a very full chapter upon the

Rose.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. Not the least interesting part of the work is the author's personal experience, as he tells not only how he succeeded, but the mistakes he committed. Thus far it is

"The Book of Flowers."

SENT POST-PAID.

PRICE, \$1.75.

ORANGE JUDD & CO., 41 Park Row.**WARDER'S****Hedges and Evergreens.**

This is the only book wholly devoted to the cultivation, pruning, and management of plants suitable for American hedging, especially the Macra, or OSAGE ORANGE; illustrated with engravings of plants, implements, and processes; to which is added a *Treatise on Evergreens*, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo. 291 pp. SENT POST-PAID. PRICE \$1.50

ORANGE JUDD & CO., 41 Park Row.**BUIST'S****American Flower-Garden Directory.**

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms or Parlor-Windows, FOR EVERY MONTH IN THE YEAR, with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo. SENT POST-PAID. PRICE \$1.50

ORANGE JUDD & CO., 41 Park Row.**BONNER'S****Method of Manure Making.**

COMPLETE AND CLEAR IN ITS DIRECTIONS.

Carries Conviction of its usefulness, and the correctness of its principles.

Quinby's Bee Keeping.

By M. QUINBY, Practical Bee-keeper. Fully Illustrated. Entirely new. The result of 35 years' of successful experience—with directions for all contingencies that can ordinarily occur; treating of Breeding, Movable-Comb and other Hives, Pasturage, Robbing, Feeding, Swarming, Queens, Diseases, Anger, Enemies, Wax, Transferring, Sagacity, Wintering, Care of Honey, Italian Bees, Purchasing, etc. Bee-keepers will find this new work of Mr. Quinby's fully up to the times in all practical matter.

Sent Post-paid. Price \$1.50.

Gratifying Opinions of the Press.

From the Christian Intelligencer.

"Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From Moore's Rural New Yorker.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the Vermont Farmer.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the N. Y. Christian Advocate.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

SENT POST-PAID PRICE \$1.50.

ORANGE JUDD & CO., 41 Park Row.

FLAX CULTURE.

A NEW AND VERY VALUABLE WORK, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper. PRICE 50 Cents.

HOP CULTURE.

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING, and MARKETING the Crop. By Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER. 8vo, paper. PRICE 40 Cents.

TOBACCO CULTURE.

This is by far the most useful and valuable work ever issued on this subject. It contains full details for the Selecting and Preparing of the Seed and Soil, Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by FOURTEEN EXPERIENCED TOBACCO GROWERS, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 48 pp., in neat paper covers. PRICE 25 Cents.

ONIONS.

How to Raise them Profitably.

Practical Details, given very plainly by *Seventeen Onion Growers* of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers. Price 20 cents.

GRAPE CULTURIST.

By ANDREW S. FULLER.

New Edition, Revised and Enlarged.

This is the best Book published on Hardy Grape Culture.

CONTENTS.

INTRODUCTORY.—BOTANICAL CHARACTER OF THE Vine, Propagation by Seed.—4 Illustrations.

GROWING FROM SEED.—GATHER WHEN FULLY RIPE.

PROPAGATION BY SINGLE BUDS.—MODE OF OPERATION, Planting in Beds, Single Buds in Open Air, Starting in Hot-Beds, Form of Single Bud Cutting.—3 Illustrations.

CUTTINGS OF UNRIPE WOOD.—THOUSANDS OF VINES are Annually Produced from Green Cuttings.—4 Illustrations.

PROPAGATING HOUSE.—PERFECTION SHOULD BE our Aim, Span Roofed Propagating House, Lean-to Propagating House, Single Roofed House, Flues.—2 Illustrations.

CUTTINGS IN OPEN AIR.—TIME TO MAKE CUTTINGS, Selection of Cuttings, Form of Cuttings, Mallet Cuttings.

LAYERING THE VINE.—THIS IS ONE OF THE MOST Certain and Convenient Methods in Use.—1 Illustration.

GRAFTING THE GRAPE.—THIS IS AN OLD BUT VERY Uncertain Mode of Propagating the Grape, but Can be Used Successfully.—4 Illustrations.

HYBRIDIZING AND CROSSING.—THESE ARE OPERATIONS that Should Demand the Attention of Every One Who Undertakes to Produce New Varieties, Mode of Operation.—3 Illustrations.

TRANSPLANTING.—VINES WILL OFTEN REQUIRE ONE Season of Nursery Culture before being Planted in the Vineyard, Heeling-in.—3 Illustrations.

SOIL AND SITUATION.—MUCH DEPENDS UPON THEM. Preparing the Soil, Manures and their Operations.

STEM APPENDAGES.—SPINES, HAIRS, LATERALS, Forms of Leaves, Tendrils, Buds.—7 Illustrations.

PLANTING THE VINE.—A GREAT DIVERSITY OF Opinion, My Own Rule, Root Pruning, How to Plant.

GRAPE TRELLISES.—2 Illustrations.

TIME TO PRUNE VINES.—PRUNING AND TRAINING, Opposite Arms, Oblique Arms, A Plan for Poor Soils.

GARDEN CULTURE.—POSITION OF BORDER, Training the Vines, Four Tiers of Arms, Double Stem, Trellises in Gardens, Training to Stakes, Girdling the Vine, Removing the Leaves.—9 Illustrations.

GATHERING THE FRUIT.—PRESERVING THE FRUIT, Wine Making, Pruning Shears.—1 Illustration.

INSECTS.—ROSE CHAFER, GRAPE VINE FLEA BEETLE, Spotted Pelidnota, Tree Beetle, Caterpillars, Yellow Bear, Hog Caterpillar, Grape Vine Sphinx, Blue Caterpillar, Proctis Americana, Leaf Rollers, Thrips, Aphids, Red Spider, Vine Scale, Diseases, Mildew, Sun Scald.—18 Illus.

DESCRIPTION OF (nearly Seventy) VARIETIES.

REVIEW OF VARIOUS SYSTEMS OF PRUNING AND TRAINING, Reversing the Arms, Single Arm System, Bow System, Long Rod Spur System, Upright Canes, Thimery System.—Index.

Agricultural & Horticultural
Practical Knowledge.

Embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It contains **926 large Octavo Pages, and 250 Engravings.** Describing and Illustrating nearly the whole range of topics of interest to the **FARMER, the GARDENER, the FRUIT CULTURIST, and the AMATEUR.**

It is adapted not only to those owning large and Elegant Estates, but contains directions for the best arrangement of the smallest Plots, down to the *City Yard*, the *Roof or Window Garden*, or the simple *Flower Stand*. It also gives an abstract of the Principles, Construction and Management of *AQUARIUMS*. Among numerous other matters it treats of

Draining, Giving best methods, estimates of cost, trenches, tiles, etc., thus enabling almost any one properly to perform this important work.

Cattle are carefully noticed with reference to the special merits of different breeds for dairying or fattening.

Sheep Management, including Breeding, Feeding, Prices, Profits, etc., receives attention, and a very full treatise on the Merinos is given.

Grape Culture occupies a large space, embracing the opinions of men in all parts of the country, as to best sorts, planting, training, diseases, and general management for home use or marketing.

Full Lists of Ornamental Trees and Shrubs, Fruits, Flowers, Green and Hot-house Plants, etc., are given, with directions for management each month in the year.

The Kitchen Garden receives particular attention, with reference to the best way to grow and preserve each kind of Vegetable.

In short, as its name indicates, the book *treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.*

The Miniature Fruit Garden,

OR THE CULTURE OF
Pyramidal and Bush Fruit Trees.

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

SENT POST-PAID. PRICE, \$1.00

ORANGE JUDD & CO., 41 Park Row.

My Vineyard at Lakeview;
Or, Successful Grape Culture.

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

SENT POST-PAID. PRICE \$1.50.

Wringer

Wringer

IN USE.

IN USE.

CLOTHES WRINGERS have become an article of indispensable necessity in every family, and people who use them wonder how they ever managed to live without. They are one of the greatest **LABOR-SAVING MACHINES** of the age, and one of the least expensive. They more than pay for themselves in a few months' use, in the wear and tear of garments alone. It has become an established fact that in all households where the **EUREKA** is used, their clothes last about twice as long as in those who wash and "wring out" by the old-fashioned twisting process by hand. The **EUREKA** is superior to all other wringers in many respects:

1st. It is made entirely self-adjusting by means of Steel Elliptic Springs. These require no alteration and are always ready for any sized garment, from a lace collar to a bed spread.

2d. It is composed mostly of Iron and Steel, which makes it very durable.

3d. In consequence of the elasticity of the springs, the hardest part of the labor of washing and wringing is easily performed, and without injury to the finest fabrics.

4th. The Improved Rubber Rolls now used in this machine are of the very best quality, and with care will last for years.

5th. By means of the adjustable clamps or fasteners, they fit any shaped tub—round or square.

All the steel and iron of this wringer are covered with several coats of Jet Baking Japan, making them entirely free from any liability to rust.

HEAD OF "BARON," INFANTADO MERINO RAM.—BRED AND OWNED BY WM. CHAMBERLAIN.—Drawn from Life for the American Agriculturist.

The fine Ram, whose head is portrayed above, is of the breed known in this country as *Silesian Merino*. He was bred by his owner, Mr. Wm. Chamberlain, of Red Hook, N. Y., from pure Infantado stock, and has a documentary pedigree running back to 1811, when his ancestors were imported from Spain into Silesia. The wool is fine and very dense, with comparatively little grease or yolk, and the fleece, which usually weighs about 16½ pounds, covers the carcass remarkably, and grows well down to the hoofs. We regret not to be able to state the weight of cleansed wool, for we are confident it would compare most favorably with that of fleeces

which, in the grease, would weigh a great deal more. He took the first prize in his class at the last show of the New York State Agricultural Society, where the artist secured the sketch for the above engraving. It was very gratifying to us to witness the satisfaction of several wool manufacturers (some of whom we asked concerning their opinion of Mr. Chamberlain's Silesians,) when they examined the fleece of this ram and other sheep of the same stock. It confirmed us in a long held opinion that it will pay for farmers to produce such wool as manufacturers want to buy. The wool of these sheep is of great uniformity and excellent quality, opening

brilliantly, but the yolk gives it a dark crust at the surface. This kind of Merinos have compact, well-formed carcasses, and are not given to wrinkles nor grease in the excessive fashion of those popularly known as the Vermont or American Merinos. The Infantado's were imported also into this country about the same time that "Baron's" ancestors were taken to Silesia, and from 1813 to about 1845 were bred pure by Stephen Atwood of Connecticut. As now known, the two families both claiming much the same parentage, present notable differences, though many similarities, and breeders of good judgement are divided in their preferences.

Back Volumes Supplied.—The back volumes

of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1837—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, FEBRUARY, 1867.

We hope our readers will not think that we are unreasonably "harping upon one string," when we again insist upon the necessity of laying definite plans for work to be done. This makes the difference between success and failure—between thrift and unthrift, provided of course, that such plans are made, as may be, and are, carried out. An old farmer knows by experience what may be done, by what has been, and it is well for the young farmer not to undertake too much. Depend upon it, time will not hang heavy on your hands. Do what you undertake, thoroughly well, but do not "putter" and fuss to no account. Especially regard four things: *First*: "Your own health and that of the family, especially that of the good wife—relieving her in every possible way, by servants, by washing machine and wringer, by sewing machine, by your own helpful care, solitude, and interest in her work and cares. *Second*—*System*: Having every thing go according to a preconceived plan. *Third*—*Time*: Being prompt, up early, having chores done, breakfast ready at the moment, and the work of the day begun as nearly as possible at the same hour daily—and so through the day. Besides, allowing full resting spells, permit no loitering of men or teams. *Fourth*: If you employ one or more hands, impose a strict responsibility in regard to certain work, and enforce the same. Thus things will go smoothly.

There is one thing farmers are very apt to neglect, and that is, the Kitchen Garden—many of them hardly glance at the *hints* in another column. A good vegetable garden is the most profitable part of any farm. Manure will pay best applied there, and labor will produce more comfort, food and gratification if expended in the garden than elsewhere. And in the neighborhood of villages there are always quick sales for fresh vegetables, and by the preparation of a little more ground and a small additional cost for seed and tillage, no inconsiderable income may be derived. Think of this while making plans for March and April work.

Hints About Work.

At the North we are pretty much out off from proper field work, yet, as the *Agriculturist* goes Southward, it soon comes upon bare fields and soil in which no frost remains long. There spring begins in good earnest a month or six weeks earlier than in our latitude (41°), and "spring plowing," etc., is there winter work. We adapt these hints to our own latitude, but are apt to anticipate a little, chiefly in order to have plenty of leeway in case the season is especially early.

Field Work.—Dead furrows in grain fields and furrows plowed for surface draining should be clear, so that the ground will not wash much in thaws. If grain is badly harmed by frost put on an even light dressing of muck or soil or simply roll.

Grass and Clover Seed may be sown if the ground is bare and the frost is out. It is best to be done on a very light snow in case the surface is not frozen. Any kind of grass or clover seed may be sown.

Manure may be hauled out to the distant fields when there is good sledding, but it should only be such as is well composed and which will neither wash nor deteriorate essentially by exposure. It may easily be put in this condition by the use of muck, but very little that is hauled to the field in the winter time is so protected from the action of the weather, and half to two-thirds is wasted.

Buildings.—Timber may be prepared for any repairs, or for new buildings which may be desired. (Pine, Spruce, and Hemlock, may be cut at this season.) Stables and cellars should be opened and aired on warm dry days. A little salt sprinkled around posts, which form the foundations of corn cribs and similar structures will prevent their being harmed by the frost. This is true of gate posts.

The Wood Lot affords plenty of work in cutting

fire wood, getting out framing stuff, cedar beam poles, stakes, and such things. Avoid cutting trees that are full of sap at this season, or as soon as the weather is warmer—as the maple, beech, etc.

Ice.—Review what has previously been said about storing ice, it is not too late so long as good ice can be procured. Pack only solid ice, removing all the soft snow ice that may be attached to the eakes.

Secure Seed of each kind of grain it is proposed to sow this spring. If you can do so, select seed grain from a large quantity by repeated winnowings. Send for catalogues of seedmen, study them, and order early. At the same time also

Secure Good Farm Hands.—February is usually the time to make the best engagements.

Working Stock, if not employed, should not be fed too much grain, but roots should be in a measure substituted, and if hard worked, feed accordingly.

Horses ought to be kept sharp-caulked, as ice is more dangerous if it exists only in spots than when it covers the ground. Feed four quarts of carrots with a handful of ashes and half as much ginger daily if they get "off their feed" for lack of exercise. They are approaching the time when they shed their coats, and as they are then liable to take colds, they should be well fed and in good condition. The tax upon the system in renewing the coat is considerable. Brood mares, with foal, need especial care, lest they slip and fall, or in playing strain themselves, or get kicked.

Colts.—When there is a foot of snow on the ground the time is particularly favorable to training and breaking colts to saddle and harness. Gentleness, firmness and sugar are the specifics, with the common sense use of which, we warrant it easy to break any colt not made vicious by bad boys or men.

Oxen should come out in fine condition for spring work on little besides corn stalks if these are properly prepared, namely: cut up, soaked and salted with a very little meal upon them.

Beef Stock may have a little increase of meal or oil cake when they begin to shed their coats.

Cows that are giving milk may well have wheat bran and oil-cake meal on their cut and soaked stalks. The earlier they are dried off, the better will the calf be, in all likelihood, but if milked until nearly time for the new milk to "spring" a tendency to give much milk is increased.

Calves intended for veal may very early be taught to nibble hay, and finally to eat a good deal, and with what skimmed milk they can get in their boiled gruel, they will make rapid progress.

The Currycomb should not be neglected, its exercise on all kinds neat stock and horses is a great prevention of disease and vermin, and is productive of thrift.

Sheep should be kept so assorted in flocks that all can get the proper allowance of feed. Provide a warm shed, feed straw and hay in racks, and grain in troughs; of course, feed some roots, or hemlock boughs, or both. House ewes near yearning time, where they will have room, warmth, and comfort.

Visit all the stock personally the last thing at night and first thing in the morning. See that they have water enough, at least twice a day, better three times. Give salt frequently, and let them stand several hours in the yards every day if fair.

Poultry.—Set one or two clutches of the earliest eggs, mating the finest pullets with the best old cock, as early in the month as possible, provided you can furnish the chicks warm, dry, light quarters. Kept clean, and attended with care, they will make fine birds, either to improve your own flock, or for the fall shows.

Swine.—Keep the shoats at work at the manure. We often think of the saying of a Massachusetts farmer, that for corn, a cob that a hog had breathed on is worth a bushel of yard manure. Breeding sows near farrowing, should be well sheltered, and have warm nests away from other swine and be fed well, but not with heating food; a few raw potatoes or other roots are promotive of milk, and make an excellent addition to their diet.

Work in the Horticultural Departments.

The "note of preparation" should be sounding in every department. Occasional mild days will allow of some out of door work, and the tool-house and repairs in the work shop will give abundant indoor employment. Have everything ready, not only the tools and appliances, but have all *plans* made for the opening season. This month, catalogues of the dealers are ready, and if trees or other nursery stuff or seeds, etc., are to be purchased, our advertising columns will show where the articles are to be had. Order early, as the stock of some things is often exhausted later in the season. In sending an order to nurserymen or seedsmen write plainly, and put only one article upon a line. Mistakes are usually as much the fault of the purchaser as of the seller, who is often puzzled to find out what is wanted. If any correspondence is necessary, have it separate from the order. Give clear directions how the articles are to be sent, and do not omit to give the address in full. A dealer of our acquaintance recently received an order inclosing money, but no name was signed; a few days after he received a letter from the same writer, which informed him that an order had been sent a few days before, but that the name had been forgotten, and *this* letter of explanation also had no name to it.

Orchard and Nursery.

The principal items of out door work were indicated last month. As the severity of the weather moderates, the knife may be used in shaping

Young Trees.—Cut them back to secure a stocky growth, and a well balanced form. Do not cut so close to a bud as to endanger it, nor so far above as to leave a stub. The treatment of young trees that have been badly formed is noticed on page 62. Though February is not the best possible month for

Pruning, there are many who are obliged to do it now; select a time when the wood is not frozen, and observe the precautions mentioned on page 62.

Old trees and neglected young ones may have a wash of soft soap, mixed with water enough to apply with a brush. If there is much loose bark, or a great accumulation of moss, a blunt scraper may be used. Some are made for this use. Every cluster of

Caterpillar's Eggs removed now is clear gain; the Tent-caterpillar's were described in January.

Cions are to be cut on mild days, and kept in saw-dust or moss until wanted. Earth or sand will keep them as well, but they are less pleasant to use than when preserved in moss or saw-dust. Cions are readily sent by mail; tie them in a bundle, wrap in oiled silk, and over all put a stout brown paper, and tie securely. Mark "cuttings only," and put no writing in the package. Postage is 2 cents for 4 oz.

Grafting should be deferred until the buds of the stock begin to swell—which they will do this month in some parts of the South. Root grafting ought to be finished up, and the grafted roots ready to set out.

Nursery trees will be received by some of our southern readers, and if long on the way may have suffered from drying, or they may be frozen. Completely bury all dried or shrivelled trees, and if not too far gone they will become plump in a few days. Any packages, the contents of which are likely to be frozen when they are received, should be allowed to thaw gradually in a cool place before opening.

Manure may be spread in the orchard wherever the ground is not frozen.

Fruit Garden.

Continue to exercise oversight, and see that no injury comes to trees and plants by animals. If **Grape Vines** were not pruned in autumn, take advantage of the first thaw, and do it this month. The wood from winter pruning is not so good for cuttings as that removed in fall, and if used for this purpose must be carefully selected.

Currents may also be pruned, and the cuttings buried until the weather allows of their being set.

Dwarf trees treat as noticed above, under Orchard.

Kitchen Garden.

As there is but little to be done here, in northern localities, our notes for January are equally good now. Make every preparation for spring work.

Manure, whether for garden use or for hot-beds, should be accumulated. When the heap becomes hot it should be turned to avoid injury.

Hot-beds are to be made at the South, and at the North, if very early plants are wanted. For the simplest form of hot-bed see page 63. Prepare

Straw-covers, as described on page 63, or straw mats; the last are made by stretching a warp of five tarred strings, the width of the sash and a foot longer, then laying on handfuls of straw, each of which is to be bound to the warp by a small string.

Cold Frames need more close attention as the weather gets milder. Open them whenever the weather is not severe, and harden off the cabbage and other plants to fit them for early transplanting.

Root crops still in the ground, such as horse-radish, parsnips and salsify are to be dug and marketed whenever the ground is sufficiently thawed.

Onions, if frozen, should be kept so by a covering of hay to prevent alternate freezing and thawing.

Poles and brush that may be needed for beans, peas and other climbers, are best cut before vegetation starts, and while the swamps are frozen.

Rhubarb is easily forced where there is plenty of manure. Cover the roots with boxes or barrels, and surround them well with heating material. The leaves soon start, and when grown in the dark in this way are exceedingly tender. Do not forget that all labor is lost unless you have good

Seeds.—If there is any doubt about the quality of seeds, be at any trouble or expense to procure those of a reliable character. Buy of responsible parties only. The postal arrangements, for all except points reached by the over-land mail, are such that it makes but little difference where one lives, 'as the mail puts him in reach of all the seed stores in the country. See "Basket" item on page 50.

Flower Garden and Lawn.

The mild days will allow pruning to be done.

Ornamental trees, as a general thing, should be left to assume their natural form, but it sometimes becomes necessary to remove branches that are in the way, and others that have become injured by winds or snow. All pruning of them should be done with as much care as with fruit trees—for which see article on page 62.

Shrubs, too, will need the knife and the shears. They ought not to be cut into formal shapes, but left still in their natural form. Those that bloom upon the new growth may be shortened at pleasure, while those that have their flower buds ready formed only need to have crowded branches thinned out.

Repairs of fences and of trellises, arbors, and all garden fixtures may be made and painting done.

Pits and cellars where plants are stored will need looking to. Give air on mild days; if the plants become very dry and likely to suffer, water moderately.

Dahlias, Cannas, and other roots, stored in the cellar for winter must not be allowed to be damp enough to mould or rot. If this occurs, separate the affected ones and remove to a dryer place.

Green and Hot-Houses.

The variable weather this month will demand care with the fires to secure that uniformity of temperature so necessary to success.

Insects are easily kept in check if taken in time. Burn tobacco occasionally at night at closing the house to keep the green fly in check.

Camellias and other shrubs that have done flower-ing may be trimmed into shape. The camellia, especially, is often neglected in this respect.

Bulbs are to be brought into the green house to supply the place of those that have gone out of flower.

Propagation of all kinds of bedding stuff may be commenced, and seeds of annuals may be sown.

Roses coming into flower may have very weak liquid manure, not more highly colored than tea.

The Apiary for February.

Bee culture requires, in its most successful management, the right thing to be done promptly at the right time, hence, all necessary appliances should be in readiness before wanted. Bees do not wait our convenience, and so we must closely observe their habits and accommodate ourselves to them. A knowledge of them can be gained from the standard works on Bee Culture, but practice, in connection with the theoretical knowledge, is essential to success. It is easily gained, and so, young bee keepers need not be discouraged by a lack of success for a year or two. Bee keepers in most of the United States and Canada encounter two draw backs—namely, cold winters, and an interrupted and irregular succession of flowers. These may be obviated, to a considerable extent, by protection in winter, and by cultivating honey producing flowers, adapted to bee pasturage.

Success depends to a great degree in being able to know what is going on within the hive—for this moveable frame hives are necessary. Then it is proved that Italian Bees are superior to the common or black ones, not only because they are more industrious, better workers and breeders, but especially because more easily handled (if pure), hence, it is best to have them if they can be obtained.

MEMORANDA, FURNISHED BY M. QUINBY.

Only the light newly fallen snow is dangerous to bees; if a warm, bright day should come the day after snow has fallen, shade the hive to discourage the bees leaving. Should bees that are housed become uneasy, and some of them, leaving the hive, discharge filth on its sides, it is well to put them out some good warm day, and return at night. If bees are to be changed to any new stand or beehouse, let it be done this month, or next, at least, before they fly out to mark the locality. It is worse to move a short distance than a great one. Separate stands and roofs are approved by many, and if adopted, should be crowded with hives, to secure all possible advantages. This involves the necessity of making artificial swarms, and rearing and introducing laying queens to all the hives as they need them; this is not a difficult operation.

See that no full colony is without one longer than two to seven days. Those intending to do this, should prepare now a few miniature moveable comb hives, with a few of the combs filled with dry combs. Directions for raising and introducing queens will be given at the proper season. This month is a good time for purchasing more stocks, if wanted, as they may be moved safely by sleigh.

When purchased stocks have been housed during the winter, they should have at least one fair day on which to fly, before starting on a journey.

The Indiana Horticultural Society.

—The annual meeting of this Society was held at Indianapolis on January 8th. We extract the following from the letter of a correspondent who was present: The veteran President, J. D. G. Nelson, of Fort Wayne, opened the meeting with some interesting and encouraging statements as to the status of Horticulture in the State. Sundry papers and reports were presented by the officers of the society and from county societies. The following members were elected to office: *President*, J. D. G. Nelson, Fort Wayne. *Vice-Presidents*, A. Furnas, Danville; Calvin Fletcher, Indianapolis; J. C. Shoemaker, Rome; E. C. Siler, Parke County. *Secretary*, S. W. Pearson, Plainfield. *Corresponding Secretary*, Jos. Gilbert, Terre Haute. *Treasurer*, J. S. Dunlop, Indianapolis.—Committees were appointed to examine and award premiums upon the specimens on the table. The show of fruits was very extensive and fine. Quite an array of native wines was also on exhibition. Several papers of interest were read during the course of the sessions—but the great work of the meeting has been the revision of the Fruit Catalogues, the result of which can only be seen in the official report, soon to be printed. In the course of the discussions, insects came in for a share of consideration, and many testified to the advantage they had gained from reading the *Practical Entomologist*. One evening was devoted to the memory of the late Secretary, Geo. M. Beeler, and to the presenting an eulogy of him to a large and attentive audience of his fellow-citizens and admirers.

No. 75—General Book Premium.—Any one not desiring the specific Book premiums, 63 to 74, on sending any number of names above 25, may select Books from the list (next page), to the amount of 10 cents for each subscriber sent at \$1: or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each: or to the amount of 60 cents for each name at

\$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in Our Premiums, Nos. 63 to 75, above.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for a month, ending Jan. 22, 1866, and also for the year ending Dec. 31:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.					
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.
30 days this month	1,299,009	1,475,000	2,078,000	314,000	1,059,000
25 days last month	1,417,000	2,403,000	2,184,000	481,000	2,247,000
SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.
30 days this month	248,500	681,000	1,732,000	218,000	546,000
25 days last month	214,000	1,012,000	2,593,000	179,000	891,000
2. Comparison with same period at this time last year.					
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.
30 days 1867.	299,000	1,475,000	2,078,000	314,000	1,059,000
25 days 1866.	125,000	51,500	139,000	11,300	10,500
SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.
30 days 1867.	248,500	681,000	1,732,000	218,000	546,000
25 days 1866.	218,000	473,000	952,000	65,000	46,000
3. Exports from New York, Jan. 1, to Jan. 19:					
	Flour.	Wheat.	Corn.	Rye.	Oats.
1867.	17,632	12,335	194,024	13,912	14,324
1866.	55,237	50,284	63,850	15,419	2,661
1865.	47,742	43,834	74,500	1,825	141
4. Receipts of Breadstuffs in New York in each of the last four years:					
	Flour.	Wheat.	Corn.	Rye.	Barley.
1866.	2,720,835	5,729,912	22,180,532	1,314,913	5,693,485
1865.	3,028,526	8,768,920	15,935,277	809,679	3,239,054
1864.	3,967,717	13,458,136	7,164,895	491,915	2,514,891
1863.	3,574,059	19,937,856	14,334,599	439,567	2,143,485

5. Exports from New-York during each of 8 years past:

	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
1866.	900,084	522,669	11,079,304	248,648	1,329,942	1,190,583
1865.	1,002,144	2,527,926	4,549,610	196,348	—	94,567
1864.	1,918,532	12,193,433	846,831	588	150	42,135
1863.	2,527,338	15,424,889	7,533,431	416,369	52,439	126,556
1862.	2,961,518	25,564,755	12,029,848	1,041,549	42,061	210,669
1861.	3,110,341	28,893,314	12,889,850	1,000,405	3,927	160,825
1860.	1,826,202	13,538,039	4,083,082	450	8,180	108,076
1859.	1,088,516	297,587	497,886	—	6,550	2,568

6. Comparative Stock of Flour in New-York, Jan. 1:

	1865.	1866.	1867.
Western and State Flour, bbls.	463,835	703,232	630,357

Gold has been down to 131 1/4, up to 137 1/4, and closes at 135 3/4. Breadstuffs have been less freely offered, and also in less active request. Prices improved early in the month, but have been variable and rather depressed for two weeks past. There is now more firmness apparent, and holders evince more confidence in the immediate future, though the demand is not very brisk. The export business has been checked by the scarcity of desirable freight room. Receipts from the interior have recently been very light, and the available supplies have been diminishing since the opening of the new year. We give, in the accompanying tabular statements, a comparative exhibit of the stocks of flour and grain on hand at this port, Jan. 1, in each of the last three years. This, with the comparisons of the receipts at, and exports from the port, for three years, constitutes an interesting feature. Provisions have been in better request, but at irregular prices, the market closing slightly in favor of sellers. Cotton has been in fair demand, opening buoyantly, but closing heavily. Thus far, in the current cotton year, commencing with

Sept. 1, the receipts at this port have been 191,000 bales, and at all the shipping ports of the country, 890,000 bales; exports from this port, 133,500 bales, and from all ports, 375,000 bales; estimated stock now here, 163,000 bales, and at all the ports, at latest mail dates, 548,000 bales. Wool has been in moderate request for manufacturing purposes, and there has been more firmness, without any remarkable buoyancy in prices. The stock of domestic fleece in this market on January 1st, was 4,450,000 lbs.; of domestic pulled, 800,000 lbs.; of Texas, California and Oregon, 2,080,000 lbs., making the total stock of domestic wool here at the opening of the new year 7,330,000 lbs., against 4,500,000 lbs. Jan. 1, 1866, and 4,700,000 lbs. Jan. 1, 1865. The total stock of foreign here on the 1st of Jan., 1867, was 25,460 bales, or equal to 14,902,500 lbs. The imports of foreign wool at this port, in 1866, reached 58,724 bales, against 53,429 bales in 1865, and 113,668 bales in 1864. The total arrivals of foreign and domestic wools at this port in 1866 were 150,705 bales, equal to 59,033,216 lbs, against 50,460,303 lbs. in 1865, and 77,699,443 lbs. in 1864. The clip of wool in the United States, in 1866, has been estimated at 137,000,000 lbs., yielding about fifty per cent. of clean, pure wool. Tobacco has been in more demand at steady rates. Hay and Hops have been in better request and firmer. Seeds, Rice and Hemp have been quiet and rather heavy in price.

New York Live Stock Markets.

The supply during the past five weeks has continued fair for the season, as is shown in the following table:

WEEK ENDING.	Beef.	Cows.	Culves.	Sheep.	Swine.
Dec. 25	6,599	54	550	24,050	15,650

Total in 1864	267,609	7,603	75,621	782,462	660,270
Total in 1863	264,091	6,470	35,709	519,316	1,101,617

The supply has been fully up to the requirements, at least until just now, when the severe storms are interfering with transportation. Beef Cattle have not varied greatly in value during a month. A few extra animals command 17c. @ 18c. \$ lb, estimated dressed weight; good or first quality, 15 1/2c. @ 16 1/2c.; medium, 14 1/2c. @ 15 1/2c.; common to poorest, 14c. @ 12c. Milk Cows.—The receipts have been light, but the demand is small. Extras, when sold, bring \$90 @ \$110; good, \$80 @ \$85; common, \$60 @ \$75; poor, \$55 @ \$65. Veal Calves.—Receipts light. Really good animals sell readily at 13c. @ 14c. \$ lb, live weight; other grades, 12 1/2c. @ 10c., according to quality; some of the poorest 9c. Sheep and Lambs.—The supply has been very large for the season, and prices have continued very low until within a few days. The present rates are 7c. @ 7 1/2c. \$ lb, for superior lots, some extras, 8c.; good, fair sheep, 6c. @ 7c., and poor, 5 1/2c. @ 6c. Live Hogs.—The supply has been ample, and with large receipts of dressed hogs, and the heavy decline in barrelled pork, prices have ruled very low, sometimes as low as 6 1/2c. \$ lb, live weight. The latest sales were at 7c. @ 7 1/2c.

[The following sent by the Publishers of the Evening Post to our advertising columns, was crowded out, and as a matter of courtesy we admit the advertisement here.]

The Weekly Evening Post, and the American Agriculturist for \$2.50 a year.

We have made arrangements with Messrs. Orange Judd & Co., publishers of the *American Agriculturist*, which will enable us to furnish a copy of their excellent paper, together with our own weekly paper, at the low price of two dollars and a half a year for both. The advantage of this arrangement to our readers is easily demonstrated, thus:

The price of a single copy of each is—	
WEEKLY EVENING POST	\$2 00
AMERICAN AGRICULTURIST	1 50
Cost of both, if ordered separately	3 50
Cost of both, if ordered through us or them	2 50

Those who prefer the SEMI-WEEKLY EVENING POST, can have both it and the *Agriculturist* for FOUR DOLLARS A YEAR.

The *A*

the members of an intelligent farmer's family can be filled, at a very reasonable price.

We have frequently commended the *American Agriculturist* to our readers as the best paper of its class in the country, and we are glad to know that its value in the future will be greatly enhanced by a liberal expenditure on the part of the publishers in several departments that will add greatly to its interest in the family circle.

The two journals, one monthly, the other *weekly* or *semi-weekly*, as the subscriber prefers, furnish a full supply of interesting reading matter, relative to all that occurs in the world of literature, art, science, politics, and what is spoken of and discussed in the great centres of civilization. Address WM. C. BRYANT & CO., PUBLISHERS OF THE EVENING POST, 41 Nassau Str., Cor. Liberty, New York, or: ORANGE JUDD & CO., PUBLISHERS AMER. AGRICULTURIST, 41 Park Row, N.Y.

The "Evening Post," New-York, A Newspaper.

Now, as always, pledged to the advocacy of the Great Principles of FREE SOIL, FREE SPEECH, FREE LABOR, FREE MEN AND FREE TRADE!

PLEASANT WORDS. The following complimentary expressions are selected from numerous notices of this Journal: "The" *EVENING POST* of New York city—where else? for this paper has the proud cognomen of "The" *EVENING POST*—is one of the most ably edited, racy and high toned papers in the country. We heartily bear witness to the ability, character and culture displayed in its management, and wish it even more prosperity in the next than it has experienced in the last half century.—*Chicago Post*.

The *EVENING POST* is a pattern of typographical style and neatness, and the favorite of the *littérati* of Gotham. Its editorials, able and high-toned, are written in the interest of no party, are always up to the times, and often a little ahead. It is an acknowledged leader, and wields a powerful influence upon the mind of the nation.—*Boston Voice*.

The New York *EVENING POST* is one of the largest newspapers of the United States, and always one of the best and most entertaining; its friends and readers are of the most substantial class in the country.—*Taunton (Mass.) Gazette*.

The *EVENING POST* is edited with as much ability as any paper in the country, and its instincts and principles are all in favor of freedom and the progressive party of the day.—*Hallowell Gazette*.

The *EVENING POST* is one of the very best papers we receive; its editorials are thoughtful and dignified, its news judiciously and carefully selected, and a general culture and literary taste characterize its contents. As a good family and newspaper, it has no superior.—*Ashtabula Sentinel*.

The *EVENING POST* is an honor to American journalism. Dignified, direct, and forcible in style, its editorials are frequently models of linguistic purity and elegance.—*Christian Intelligencer*.

REMITTANCES should be made, if possible, by draft or Post-office order, payable in N. Y. Specimen copies free.

WILLIAM C. BRYANT & CO., PUBLISHERS, 41 Nassau Street, New-York.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

"& CO."—Another Agriculturist Publisher.

Last month, page 10, an addition to our editorial corps was noted, and we now have another pleasant announcement. In October, 1865, it was stated that the previous Publisher had associated with himself Mr. LUCIUS A. CHASE, of Boston. The copartnership thus formed, has gone on pleasantly and very prosperously for nearly a year and a half. But the business and editorial cares have increased so rapidly, that, with the experienced and very effective aid of his partner, Mr. JUDD has not found even the partial relief from severe labor that he has for years needed. The copartnership has therefore been still further enlarged by the addition of Mr. SAMUEL BURNHAM, JR., who has for a number of years past superintended the issuing of the extensive book and periodical publications of the American Tract Society, at Boston, Mass. (Our readers who also read the "Child at Home," will be glad to recognize Mr. B. as the "Uncle Paul" and "Victor" of that paper.) That Mr. Burnham's labors have been appreciated there, is pleasantly attested by the great *surprise* boxes, containing silver plate and other valuables, which have just followed him here, sent as tokens of regard and esteem by his late associates in the Tract House, and among business men of Boston, and by the teachers and scholars of the Sabbath School of Dr. Kirk's church, of which he has been the superintendent for several years past. The present firm of ORANGE JUDD & CO., will thus consist hereafter of Messrs. Orange Judd, Lucius A. Chase and Samuel Burnham, Jr. With this new aid, therefore, unless our friends insist upon increasing the business of this office far beyond the present bounds, which indeed they seem inclined to do, Mr. Judd may secure that relief from unremitting and severe appli-

cation, which he has so long needed, though he will, as the senior and largest proprietor, continue to superintend and advise in both editorial and business matters. We fear it will be difficult for him not to still endeavor to "hold the plow and drive;" but the associate editors and publishers intend to enforce upon him less labor and more leisure; for, in common with our readers, we desire that his period of public usefulness may be long extended. ... We give a hearty welcome to the incoming partner, and trust he may find his new field of labor as pleasant and useful as his former one. Thus reinforced in both the business and editorial departments, with all the previous working force continued, we expect the *Agriculturist*, in its new Quarter Century, will exhibit the results of increased energy and efficiency, and, with its adjunct book department, will accomplish much towards the diffusion of sound information, and the development and improvement of the important interests of the Farm, Garden, and Household.—ASSOCIATE EDITORS.

A Literary Newspaper.—The New

York Evening Post—edited almost as long as we can remember by our favorite American Poet, WM. CULLEN BRYANT, whose "Thanatopsis" we learned "to speak in public on the stage" when a youth—is one of the best family, literary and general Newspapers in our country. We do not endorse or agree with all its political and financial views by any means; but aside from these peculiarities, we prefer it to almost any other journal in the country, as a literary and family newspaper, always safe from any thing that could possibly injure the morals of even the youngest member of a household. It is full of intelligence from all parts of the world. The Post, together with the *Agriculturist*, will supply most that is needed in a family, aside from the Religious Journals. The *Evening Post* is published Daily, Semi-Weekly, and Weekly. The subscription price of the Weekly, (which, like the other editions, is a very large sheet), is \$2 a year; and of the Semi-Weekly, \$4.—In accordance with a proposition from the publishers, we will be happy to receive any subscriptions for that paper, in combination with the *Agriculturist*, as follows:—One copy of the *Agriculturist* and one copy of the Weekly *Evening Post*, one year for \$2.50. One copy of the *Agriculturist* and one copy of the Semi-Weekly Post, one year for \$4. By this arrangement, a saving will be made to the subscribers.

This Number Late.—The immense press of business at the opening of the year—far greater this year than ever before—the necessity of re-making up the paper to increase its size beyond what was at first designed, some temporary ill health among our editorial corps, etc., have all combined to keep back the present number behind the usual time of going to press; and though we make duplicate Electrotype plates of the pages, and shall use double presses on the forms, it will take some time into February, to get the last numbers into the mail bags. The March number is in active preparation, and we expect to get it off in time to reach most of our readers by the first day of the month. The process of printing Engravings in the beautiful style of this journal, is necessarily slow. The utmost capacity of any presses yet made, which can print in our style, does not exceed 10,000 to 12,000 copies per day, and this requires five presses for the five forms—one on each side of each sheet, the extra sheet being turned and cut.

Phrenology, etc.—A Subscriber objects to our advertising the Phrenological Journal, Journal of Health, and some other like things, and thus endorsing them. We do not endorse any of these things. Our rules require that Advertisers must be men who have both the *ability* and *intention* to do what they promise to do; that everything must be above board, that the readers may be able to know just what is offered. Any thing of a secret or deceptive character, or of an immoral tendency, is excluded. On matters of opinion, respecting politics, health theories, and the like, we suppose our readers intelligent enough to judge as to what they want. To meet everybody's views and wishes, we should need to leave everything out. We have heard from the man who objects to planting apple trees even, on temperance principles, but we must advertise trees, nevertheless.

Our Horticultural Annual, both in Beauty and Intrinsic Value, excels even the expectations of the Publishers, and it will give great pleasure to every reader. Its contents have been pretty fully referred to already. The first 24 pages gives on each left hand page a complete almanac adapted to the four leading sections of the country, and on the corresponding right hand page a calendar of operations for the month, which is valuable as a guide to the work to be done. The following 122 pages are filled with original and useful information, and many superb engravings on a great variety of topics. The work is in very neat style, and is ornamental as well as useful. This, with the *Agricultural Annual*, noticed elsewhere,

may well find a place in every family. Taking into account their intrinsic value and size, these are among the cheapest volumes ever issued. Price, in illustrated paper covers, 50 cents; neatly bound in cloth, 75 cents. Sent post-paid at the same prices.

American Agricultural Annual

Now Ready.—After some delays from unforeseen causes, we are now happy to lay this New Annual before the public. It contains a number of exceedingly valuable essays on subjects which are of universal interest to agriculturists. Prof. Johnson's article upon Recent Progress in Agricultural Science, is exceedingly valuable. Dr. Basteed's notes upon the results arrived at by the Congress of Veterinarians, present facts which should have an important influence upon our Legislators, and have not been made public in this country in any other form. Col. Waring presents the most recent and soundest views of the very important subject of Drainage; and the same may be said of Mr. Clough's article on Sorghum. The practical views of Mr. John Johnston on Sheep-feeding; Mr. Carpenter on Potatoes; Dr. Hexamer on Barns; Mr. Headley on Horse-Training, etc., will commend themselves to every discriminating man. There are, besides, numerous other articles, practical, explicit, and thorough, on Wheat, Barley, Agricultural Education, Poultry, etc. The subjects are very fully illustrated with engravings, of a high order of excellence. A Calendar of Operations, and numerous useful tables, rules for measurements of capacity, etc., are prefixed. This New Annual is certainly of great value, and every cultivator of the largest or smallest portion of land, would do well to secure a copy of this first of the Annual series. Price, in paper covers, 50 cents; neatly bound in cloth, 75 cents. Sent post-paid, by mail, at the same price.

Sundry Humbugs.

—The past month has brought in the usual supply of letters reporting attempts to defraud the people. Our Assistant who takes charge of and classifies the letters in this department, sums up the reports for the first half of January, thus: 5 different Medical Swindlers; 11 Sellers of vile Medical publications and instruments; 6 humbug sellers of Ink and Washing Mixture Recipes; 38 operators in Lottery, Gift Enterprise, Watch, and Jewelry Tickets, (reported in 192 letters); sundry *prospective* publications and periodicals, *promised* in return for lists of names of persons; cheap, good-for-nothing Sewing Machines; some complaints of a Map Publisher, who keeps the money sent him and don't send the maps; ditto, a Corn Husking Machine maker, etc., etc., in all 66 operators, though many of the concerns are run by the same individuals under different names. ... The result of the Crosby Horse Lottery will make a multitude sick of such schemes, but there are thirty or more similar enterprises in the country, including several that "come the benevolent dodge" by attaching to their schemes some pretended benefit for soldiers, orphans, widows, etc., etc. We unhesitatingly pronounce each and all of these affairs detestable and unworthy of the slightest countenance or favor. For every dollar that goes to a good object, several other dollars find their way into the pockets of the operators—no matter how specious their statements and pretenses. It is high time that both the law and the good sense of the country should put a stop to this new form of the old lotteries, *alias* "Gift Enterprises," "Artists' Unions," "Benevolent Enterprises," "Prize Concerts," etc. Chicago is a present "head centre" in this line. ... The Jewelry, Watch, and Dry Goods Ticket men still continue their operations. They send out circulars with tickets pretending to give the recipient a claim to some valuable article, or prize, for a small sum. Nine out of ten of these pocket the money sent them, and make no response to the letters of their victims, or when hard pressed, pretend the money has been lost by mail or otherwise. A few send out galvanized, showy articles "marked" at a high figure, but almost or quite worthless for use. Some do send out cheap but very taking articles, costing almost as much as they receive at first, so as to *bait* customers, and then they do the swindling afterwards. We warn the readers that every man who sends a circular and tickets, is a swindler, and every pretense of making you his special helper, is a fraud. Every other person in your own neighborhood whose address can be got, receives the same "private and confidential" offer as yourself. ... Carey, Vandegrift & Co., of Sidney, Ohio, complain of the classification we gave their "Soldiers' Monument Association," in October, and claim that "its object is legitimate, and benevolent, its purposes honorable, and that all its pledges or promises will be carried out in good faith." We have no information to the contrary, and give them the benefit of their statement. But their *modus operandi* is in the highest degree objectional, certainly, and "the end does not sanctify the means." They have a scheme that is neither more nor less than a lottery. They try to dazzle the minds of people with the hope of getting for \$1, a \$15,000 prize, also fine houses, a farm,

carriages, pianos, etc., and on their lottery circulars, they print an article from the August *Agriculturist*, in a way to make us appear to endorse enterprises like theirs.... To show the extent to which people are pestered by the humbug operators, a subscriber sends us *twenty-one* circulars, from as many different parties, most of which have recently been sent to him by mail. There must be many victims to these swindling schemes, or the operators could not pay the enormous expense they incur for printing, and the postage on the millions of circulars they have sent out.... A circular about "Jackson's Universal Washing Compound," quotes a tremendous puff from the "*Agriculturist*." Some paper bearing this name may have said what is quoted—but not the *American "Agriculturist*." We never heard of this compound before, but we condemn all the recipes for washing compounds, that are sold around the country. Let Mr. Johnson tell what "*Agriculturist*" he quotes.... Several subscribers inquire about sundry "Mutual Coal Companies." There may be one or more good ones: after repeated solicitations, we have not gained confidence enough in any one to invest, though we have to use a good deal of coal.... John L. Andrews, of Mariou Co., O., like a good many other unhung villains, offers for \$50 to lie a \$500 ticket through a bogus "Benefit Association." Anybody that will trust to a confessed liar, ought to be cheated.—Richard Adams, Buffalo, N. Y., is another like Andrews; so is C. F. Sherwood, Providence, N. Y., *alias* Batavia, N. Y., *alias* Huron, N. Y.... Dr. Thos. Andrews, *alias* E. Andrews, of Albany, is scattering poison among the people, in the form of Pamphlets and Circulars, called "Good Samaritans," in which he offers murderous medicines, etc. Let every body, married or unmarried, beware of trusting a word to his statements, as they value their health, their lives, and their souls. There are many others of this class.—In the same catalogue is a monster who assumes the names of a pretended firm of French ladies, and dates from a room in the "Bible House," N. Y. City. He sends a pamphlet about "Married Life," said to be "by a Married Woman." After a great deal of palaver, he comes to the gist of the matter, which is to advertise sundry villainous articles of "French" origin. None but very foolish, and insane people will risk their lives, health and money, by giving the slightest heed to this specious pretender. We are sad to know that thousands of women, and men too, are enduring terrible anguish of body and mind, and dragging out a miserable existence, while many other thousands have gone down to early graves, because they have been lured by the false statements of these very demons on earth, who, to put money in their own pockets, would sell sugar-coated arsenic to infants and idiots. We have little, if any more charity for the *Heralds*, the *Times*, and other journals, which publish the advertisements of these Madame Restelles, and the like, who make a business of murdering the unborn innocents in hectacombs, and the fair daughters of our land almost by the million.... We have hundreds of circulars pretending to be sent out from Nassau-street, Cedar-street, Third-Avenue, Sixth-Avenue, etc., offering vile publications, obscene pictures, etc. None of these parties are ever to be found at the places they hail from, or if found, they have nothing for sale or to show to *callers*—they must be addressed by mail—and they never make any return for money sent them, unless it is when they hope to make a larger sum out of their victims.

The American Pomological Society.—Col. Marshall P. Wilder, President of the American Pomological Society, informs us that, after corresponding with the Western associates, he has fixed upon September 11th, as the day for the next meeting. It is found that this date will conflict as little as any with other pomological meetings.

American Pomology.—Doct. Warder's work has been delayed, by the great number of illustrations and the inconvenience that attends the wide distance between publisher and printer. The book is now approaching completion, and will be one that will be welcomed by every fruit-grower. Its introductory chapters upon propagation, the nursery, planting, pruning, etc., are so full that they might well have formed a work of themselves. The descriptive list of apples contains all the new introductions and peculiarly western varieties. The illustrations, all made expressly for the work, are from original drawings, and are in a style superior to that of any pomological work heretofore published. Over 250 varieties of apples will be figured, the majority of which were never before illustrated. In this work Doct. Warder presents his classification of apples, in which he attempts to bring the great mass of material into something like system. How far this will prove useful to the pomologist will be proven by experience, and we have no doubt that the author will welcome any suggestions that will facilitate his object:—to aid in the determination of an unknown variety of fruit. We hope to have the work ready during the present month.

Fuller's Small Fruit Culturist.—Growers of small fruits will be glad to know that Mr. A. S. Fuller's work is in hand, as all who are familiar with his works upon the grape and strawberry, will anticipate a valuable and practical treatise upon a subject that has of late years assumed great importance. There is a directness and independence about Mr. Fuller's writings that give them a deserved popularity, and his forthcoming work will, no doubt, meet with the same favor that has attended his other productions. We have no work exclusively devoted to small fruits, and the one under notice will be very full in all particulars, from propagating the plants to marketing the fruit. The illustrations are all ready, and will be numerous and fine.

To "Authors."—Letters, concerning the publication of books, have been of late quite numerous, and perhaps a general statement of our position may save many the trouble of writing and us that of answering. No one need make a book unless he has something new to say, or can present old facts better than they have been given before. There are books enough; we wish better ones than any now extant. We cannot decide upon the publication of any work without first seeing the manuscript. In each case the manuscript will be submitted to competent judges, whose decision will be final, and no certificates or commendations from other parties can be of any use. Mere compilations of any kind are not wanted at any rate—we are not in the paste and scissors line.

My Vineyard at Lakeview.—We have just one request to make of the author of this book—viz., that he will allow us to give his name and thus put many inquisitive people out of misery. Writers upon grape culture suspect this or that person of the authorship, and we get numerous letters asking as a special favor the name of the author. We are under a pledge of secrecy which we shall keep until the author relieves us from it, and when he does, many will be amused at the wildness of their guesses. We can relieve the anxious ones to this extent. The author *does* live on the shores of Lake Erie, and more than one of those who have been so desirous to know who he is, have met him and talked grapes with him the present winter. His book is none the less valuable because it has not his name, and is growing in favor because it relates experience in grape culture, and rests its popularity upon its own merits. Price, by mail, \$1.25.

N. Y. Live Stock Markets in 1866.

—The following interesting statistics, prepared from the records kept at the Office of the *American Agriculturist*, will give the reader some idea of the magnitude of the dealings in neat Cattle, Sheep and Swine, destined for slaughter, at the Metropolitan markets. To assist the memory, we give the nearest round numbers, which differ but slightly from the actual figures: **Beef Cattle.**—Receipts 300,000 head; value, about \$32,000,000. We estimate the cattle—good, bad and indifferent—to average 700 lbs. dressed weight each, and the average of all sales at a trifle over 15 cents per lb. The weight of dressed beef amounted in round numbers to 210,000,000 lbs. This equals 140 lbs. to each of one and a half million of people, adults and children included, which is about the population supplied regularly by the New York city markets, including Brooklyn, Jersey City, and a score of smaller suburban cities and villages.... Over half of these cattle are credited to the single State of Illinois, one-sixth to Ohio, one-eighth to New York, one-ninth to Kentucky, and one-thirtieth to Indiana, or about nine-tenths to these five States.... To bring them all by railway, 15 to the car, would require 20,000 cars. Allowing 60 feet to a car, the cattle trains would stretch away nearly 200 miles.... The price of extra cattle declined about 4 cents per lb. net from January to December, medium grades about 2 cents.... The actual weekly average receipts were 5,753, against 5,253 in 1865, an increase of about 500 head per week, which has been our estimate all along through the year of the probable increase, as our readers will remember.... **Veal Calves.**—Receipts 62,000, or an average per week of about 1,200 head. This is 15,000, or 300 per week, less than in 1865, the decrease being doubtless due to the stringent measures adopted by the Board of Health to shut out young calves, or "bobs," that were so largely sold in previous years.... **Sheep and Lambs.**—Receipts 1,000,000, (or more nearly 1,030,000,) averaging very nearly 20,000 per week. This is about 200,000, or 4,000 per week in excess of any former year.... The price of the various grades ran down from 8@10 cents per lb., live weight, in January, to 4½@7c. in December.... **Live Hogs.**—Receipts, 666,000, which is 93,000 above 1865, about the same as in 1864, and nearly half a million less than in 1862 and 1863. The prices ranged between 10c. and 12c. per lb., live weight, for the first ten months, but declined from 9½c@10½c. in October, to 6c@7c. at the close of the year.... **Milch Cows.**—Receipts, scant 5,000, the lowest number in any other one of a dozen years past.... The total receipts

in 1866 of Cattle, Sheep, and Swine destined for slaughter were, according to our statistics, fully 2,000,000 head.

Look Over the Table of Contents.

—Our readers who do not read the Table of Contents in each number of the *Agriculturist*, are apt to overlook valuable articles. For instance, many did not see the Market Reports in the December number, because they were not in the part of the paper where usually found.

Gardening for Profit.—The rapid sale of this work shows that a treatise of this kind was needed, and that Mr. Henderson's recorded experience is eagerly sought after. As this is the only work in which the practice of commercial gardening is given, it has a value above that of any other on vegetable gardening, while for the private garden it is as useful a guide as any other. The value of the book is increased by a full chapter on the construction of the best form of houses for forcing or forwarding vegetables. As the same style of house is used by Mr. H. in his extensive propagation of plants, he has added an appendix on the "Propagation of Plants by Cuttings."—A neat volume of about 250 pages, on excellent paper, and well illustrated. Sent by mail for \$1.50.

New Work on Draining in Press.

—Orange Judd & Co. have now in press and will publish early in the spring, a work entitled "DRAINING FOR PROFIT AND DRAINAGE FOR HEALTH," by Geo. E. Waring, Jr., of New York, Engineer of the Drainage of the Central Park. This is a very thorough, complete, and practical treatise, simply and easily followed. The subject of thorough farm drainage is discussed in all its bearings, and also that more extensive land drainage by which the sanitary condition of any district may be greatly improved—even to the banishment of fever and ague, typhoid and malarious fevers, as shown by New York experience.

Breck's New Book of Flowers.

There are plenty of works in the style of a dictionary which tell something about flowering plants, what family they belong to, and give some points of their history. Whoever really loves flowers, and is not satisfied with these unsympathetic works, will turn with pleasure to Breck's New Book of Flowers, where he speaks of them in a familiar, talky way, and as if he loved them. This is not a book made up by re-arranging antiquated English works on gardening, but one which was *written*, and written too because the author had something to say. It is the only flower-book that records personal experience, and when that experience is that of a veteran cultivator like Mr. Breck, we care not how personal it is, for the more it tells just what he has done, the more the novice feels that he can do the same. In this work all the genera and the leading species are noticed, and their proper treatment given. *Varieties* come upon us in numbers every year, and for these the cultivator must consult the frequent issues of the florist and seedsman. Besides the annuals and herbaceous perennials, this work contains a descriptive list of the choicest flowering shrubs. A handsome volume of 480 pages, finely bound, well printed and illustrated. Sent by mail, post-paid, for \$1.75.

40 PAGES!—Our old advertising patrons who have for years past done business with our readers, and learned by experience the value of the *Agriculturist* as a medium of communication with their customers, seem more anxious than ever to secure space in our columns. They will doubtless find many other agreeable business acquaintances among tens of thousands of new subscribers this year.—These, with some new advertisers, have crowded in upon us so much that to make room for a part of them only, we have added more space, and issue 40 pages—the limit of single postage rates. This is a double advantage to the readers, as they get an extra page of reading matter for every added page of advertisements, and as our advertisers are all believed to be responsible, reliable men, the advertisements are themselves of great value to the readers—showing, as they do, what is for sale, where, and by whom. We advise a careful reading of all the advertisements, (there are no stale, long-standing ones among them).—Advertisers express so much pleasure at learning where they find so large a class of wide-awake enterprising readers as they meet through this journal, that we are induced to repeat the request that every one writing for circulars, or otherwise, or sending orders to our advertisers, will inform them in what Journal their advertisements were seen.

Advertisers, who Want Space,

must send their orders in early. Those coming after the 5th of the preceding month, have no certainty, and in future will have but little likelihood of finding admission on any terms. It takes almost a month to work off our imacuse edition, and print the Engravings well.

Hops in California.—Daniel Flint, of Sacramento Co., Cal., writes: "Last year I grew on five acres of ground 12,000 lbs. of No. 1 hops. The largest yield was on one and one-half acres, which produced 4600 lbs., or a little over 3000 lbs. to the acre. My hills are planted seven feet each way, 888 to the acre, or 1332 on the one and one-half acres, nearly 3½ lbs. to the hill."

A Good Crop of Clover Seed.—A correspondent in York Co., Pa., in reference to an article in the *Agriculturist* for January, states, that one of his neighbors, Mr. Joseph Irwin, raised 36 bushels of clover seed from 9 acres, and sold it for \$9.15 per bushel. The first crop of hay yielded 20 tons, which he estimates at \$10 per ton, or \$200. The seed brought \$329.40, making \$529.40 as the produce of the nine acres in one season.

Comfort for Cows in "Stanchions."

—Our readers know that we have always objected to the use of Stanchions for fastening cows in stables on the ground of inhumanity, and because the cows' discomfort detracts from their value to their owners. Mr. L. Safford, Newtonville, Massachusetts, has invented and patented a style of Stanchion which, to a considerable extent, obviates this objection, and, giving the cows comfort, adds to the profit of keeping them, while all of the conveniences of stanchions are retained. It is simply a contrivance by which each set of Stanchions is hinged like a door, so that the cow can swing it half around and lie at ease when she likes. We heartily advise those using, or wishing to use stanchions, to address the inventor.—See advertisement.

Meat for Fowls to make them Lay.

—One subscriber asks, what food will induce fowls to lay? another asks about scrap cake; another about hogs' lights and similar offal. To those we would say: It is the nature of fowls in good health to lay, and they cannot help it—the eggs will come. Scanty fare will reduce their laying propensity, and on very short commons, eggs cease altogether. Rich food promotes the tendency; certain seeds, like buckwheat, sunflower and hemp seeds increase it, and meat of any kind does the same. All this, however, forces the fowl into an unnatural state, and ordinarily shortens her life. The eggs, besides, have often a poor flavor. Occasional feedings of fresh meat, like the lights of hogs chopped fine, are very good in winter when the fowls find no insect food. They need, besides, hearty food in cold weather, especially if they are not kept in warm houses. In very cold weather, hens running about and roosting in exposed places, will not lay, though richly fed; their food goes to keeping them warm.

Chicken Ailments—Gapes.

—"Hoo-sier" writes as follows: I notice a great many articles on chicken ailments, especially gapes, but do not remember seeing lime recommended as a cure. In the summer my chickens, a fine brood of eighty or more, took to gaping, and every chick, least unto the greatest, went around squeaking as though they wished to discharge their "wind-pipes." I "tried the horse hair, feather, and turpentine," and almost everything I heard tell of, but nothing availed to stop the dire disease. Next I turned my attention toward the diet and drink. First, I removed the entire village to a clean grassy spot; each time I fed them, I put a good quantity of lime in the feed, which was a mixture of cornmeal and wheat bran. The drinking vessels were cleaned thoroughly each morning, and filled with clear, fresh water, pretty well whitened with lime. In less than a week the chickens quit dying, and began to improve amazingly. Not another chick died after the first week of this new course of treatment. The tonic and anti-acid properties of the lime imparted an invigorating influence upon the systems of the chicks. Give fowls plenty of lime to eat, lime and ashes to wallow in, and they will never be lousy, nor lay soft-shelled eggs.

Sorghum Vinegar.

—"J. S. C.," writes: We have never succeeded in making vinegar from Sorghum juice without boiling; but if it be boiled away one-third or one-half, 't will make good vinegar. We have made Sorghum vinegar for a number of years, and we made the best from the white skimmings and washings of the finishing pan. As soon as the juice begins to thicken up in boiling, or when it gets to be very thin syrup, a whitish scum rises, which, if saved and diluted with rain water, will make a number one vinegar. Vinegar can be made from good Sorghum syrup, (one gallon of syrup to two of rain water), but it will not work as

quick and is no better than that made from the skimmings. The reason of this I suppose is, that the skimmings contain something that acts as a ferment. Keep the skimmings until the following spring, add about as much water as you have skimmings; be sure and leave it sweet enough, for the sweeter it is the better the vinegar will be; then, if it is too sweet to work well, add more water; put it in vinegar or whiskey casks, and set in a sunny place to work.

Prize Essays on Housekeeping.

By reference to the Household department it will be seen that instead of a single first prize of \$100, we have awarded three such prizes. The names of two of the successful ones are given with the instalments of their essays; the other is Miss Eva M. Collins, of Rochester, N. Y.

Molasses Cake.

—By Mrs. Nellie Foster.—Take of Sorghum molasses 2 cupsfuls; 1 cup of butter, melted; yolks of 4 eggs, half cup of milk, 3 cups of flour, half teaspoonful of soda dissolved in a small quantity of the milk. Thoroughly stir as each article is added; whites of 4 eggs beaten. A very fine light molasses cake.

Cooking Tripe.

—Lettie Ermine says: Dip the salted pieces of tripe in corn meal, and fry in butter. Let the butter (a small portion) be quite hot before putting in the tripe, and then it will become a handsome brown color. Another way is, to cut the tripe in very small squares or strips, and stew it in milk, at last adding a little butter, pepper and salt.

Rice Pudding.

—L. Stanley, of Maine, gives the following recipe: Take one cupful of rice, boil it in a small quantity of water until tender; when done, it should be almost dry. Then add one cup of sugar, one cup of raisins, previously boiled 15 minutes, two eggs and three pints of milk; salt and spice to taste.

Door Mats.

—Lettie Ermine writes: "In a recent item upon 'door mats' you do not mention one variety. Take any such pieces as might be used for rag-carpet—pantaloon, sacks, old flannels, pieces of baize, etc., cut into strips, and braid the easy three-strand braid. Sew this braid with carpet thread, in circular or oval shapes, to lay by the doors in the dining room, at the foot of the back stairs, etc. They are so firm, that they are not easily kicked up. A large oval is very agreeable laid by the dining room stove. By a trifling effort, the red flannel, and the brown and black clothes and green baize can be made into a very tasteful little matter."

Warts on Hands.

—"Moorestown," N. J. These excrescences are sometimes very obstinate, and again disappear so readily that a number of absurd remedies have acquired a popular reputation. The surgeon disposes of them by means of various caustics, but these are not recommended for domestic use, unless one understands the nature of the articles and exercises proper care. Perhaps the safest general remedy is strong acetic acid, applied to the warts every few days.

To Color Brown.

—By L. Stanley, of Maine. —Make a dye of common alder bark. First dip the articles in this, then wring them out and dip them into weak lye. This will make the color light or dark, according to the strength of the alder dye. It is a fast color.

A Good Paper Cutter.

—Grandmother's Knitting-needle, if it is stiff enough. Try it on the *Agriculturist*. It will not do so well on the last novel.

Painting Floors.

—This is sometimes done in alternate squares or diamonds of different colors to imitate variegated marbles. But if the floors are much used, the paint soon wears off in patches and looks badly. One color we think in better taste, and the natural color of the wood, kept perfectly clean, the best taste of all

Manufactured Manures—Information Wanted from Farmers.

—That there are some good "artificial fertilizers" made, we have no doubt; but we are quite sure that there is a very large amount of cheating in this line, besides a great deal of really worthless stuff sold by innocent dealers who are working under false theories. One of the common frauds is the manufacture of a good article until a reputation is established and "certificates" obtained, and then often adulterate or depreciate the fertilizer. In order to collect some information on the subject, we solicit from each of our readers who have used any kind of special or manufactured fertilizer, a report on the results. Let us know briefly: 1st, about the date of first using; 2d, the name of the fertilizer; 3d the manufacturer's name; 4th, the seller's name; 5th, did it appear to pay; 6th, did it pay so well that its use was continued more than one year, and if so, how many years; 7th, if still in use, is it as good as when

first sold. We want the failures all reported as well as the successes; the manufacturers take good care to learn of, and give us the latter. The plainest farmer can write out brief answers to the above simple questions. We do not want these reports for publication in detail, but to gather some general results that will be given, if we can have full reports from all our readers.

Brazilian Sugar Cane.

—Mr. Charles J. Smith, U. S. Consul at Para, Brazil, has left at the *Agriculturist* office a few specimens of Sugar Cane, 15½ feet high, and carrying a diameter of 2 inches to a height of nearly 10 feet from the ground. We never saw finer cane.

Pears in California.

—Daniel Flint, Sacramento, asks if any one can beat him in raising pears. In February he set a cion of the Bartlett, and in September following he cut off the limb and exhibited it at the State Fair. It contained 12 pears and weighed 12 pounds. This will do, even for California, a State from which we look for great things in horticulture.

Trouble with Strawberry Plants.

—J. Arnold, Paris, C. W. We do not recognize the worm that killed your strawberry plants, from the description. Next year send specimens to B. D. Walsh, Editor Practical Entomologist, Rock Island, Ill. He or some of his associates will be glad to study them up for you.

Bait for Slugs.

—L. Langwor, Rutland Co., Vt., says, that a spoonful of malt placed here and there, and covered by a flower pot or other dish to prevent their access to it, will prove very attractive to slugs, which will assemble around the bait during the night and may be killed in the morning. Next to malt, he has found grated carrots used in the same way to be the most attractive bait.

New Hand-weeder.

—Mr Geo. P. Allen, of Woodbury, Conn., is the inventor and patentee of the little implement which we represent in the accompanying engraving. It is a scuffle-hoe, consisting of a thin steel blade, with two cutting edges. These edges consist of

a series of acute teeth sharpened from the under side. Held naturally, by a man standing erect, the blade lies perfectly flat upon the ground, and raising or lowering the handle gives it a tendency to enter, if shoved or drawn. The common straight-bladed scuffle-hoe, though sharp, often meets with considerable resistance from roots of grass and weeds, and frequently slips over them; even hard lumps of soil obstruct its movement. This one readily passes through the clods, and cuts any kind of roots with ease. It is especially adapted to hoeing among garden vegetables, carrots, onions, and other root crops in the field. We ourselves used one of these weeders last year with entire satisfaction.

The Apple as a Pear Stock.

—"T. J. P." proposes to set out apple trees the coming spring, and the following spring to graft them with pears. The apple is not a good pear stock—the trees are generally short lived. We cannot advise our friend to proceed in this way, and we do not see any reason why he should not set out pear trees at once. The answer to the question "will pears pay?" will depend very much upon the locality, and no clue to the place is given in this in the letter.

Shrub for a Grave.

—J. B. Bowman, Blair Co., Penn. Plants with white flowers are generally preferred for cemetery decorations. Among the best of these are St. Peter's Wreath, *Spiraea hypericifolia*, the Mock Orange *Philadelphus*, and *Deutzia gracilis*. These are all readily obtained from the nurseries and are hardy.

How Far Apart?

—"J. W. B.," Iowa, wishes to set an orchard, and is told by some to set his trees 13 feet apart, and by others to put them at the distance of two rods. Both may be right, as there is a great difference in the habit of trees. Two rods is the old rule, and is applicable to all large-growing varieties, such as the Fall Pippin, Tallman's Sweet, etc., while the Red Astrachan and others may be set at half that distance. Those who advocate close planting claim that the trees protect one another. We cannot tell what your trouble-some vine is, from the description; send specimen

Muck Composts.—"M. M. S.," Nashua, N. H., uses this:—"To each cord of dry muck add 1 bushel live ashes, and 4 quarts of salt, and mix well, and pile to shed rain...." "W. T. S.," Westchester Co., N. Y., proceeds as follows: "Slake lime with as much strong brine (an old meat or fish brine preferred, or brine made from the refuse salt of a packing house), as it will take up and not become wet. This is scattered over layers of muck dried by a few weeks exposure to the air, using about $\frac{1}{2}$ bushel to the cubic yard."—"This is a large proportion; it is usual to recommend the lime and salt mixture at the rate of 1 or 2 bushels to the cord (128 cubic feet).

Supply of Guano.—A correspondent of the N. Y. Times says: During the month of November, 1866, 39 vessels of 85,094 tons loaded guano at the Chin-chas, principally for Europe. It is estimated that there are about 200,000 tons of guano on the Guannappe Islands, which the Peruvians have commenced to work. The islands are within seven miles of the main land. The guano at the Chin-chas will be exhausted in about two years.

Manure.—"W. H. S.," of Buffalo, "W. Va.," inquires about the use of this article. It is one of the best kinds of manure, better than muck that is sold under the name of guano. It is good spread and plowed-in in field or garden. It is more commonly used as a fertilizer in the hill for all kinds of farm and garden crops. It is quite too strong to use by itself, and should either be mixed with four or five times its bulk of muck or loam, or be mixed with earth in the hill at the time of planting. Undiluted it will destroy most seeds that it comes in contact with.

Spring Wheat on New Land.—A. A. Crook, of West Virginia, has some land grubbed and cleared this winter, and asks what is the best variety of spring wheat to sow, time of sowing, quantity per acre, etc. Sow the best kind that can be obtained in the neighborhood, and as early as the land is in fit condition to work—a bushel and a half to two bushels per acre.

Spring Wheat in Wisconsin.—A Farmer's Club in Fond du Lac Co., Wisconsin, passed an unanimous vote that the *Pife* was the best and most profitable variety of spring wheat to sow in that County. We mention the fact, not for the purpose of creating a demand for seed of this well known and excellent variety, but rather to commend the action of the club. If farmers in different parts of the country, when they meet together, would take a lesson from our horticultural friends, and take a vote as to what are the best varieties of seeds, etc., they would soon be in possession of much useful information. Let the vote be intelligently and honestly taken.

Sowing Winter Wheat in Spring.—John Gilman, of Minnesota, writes us, that the crop of spring wheat in 1865 was very heavy and badly lodged, and in harvesting, several bushels per acre were shelled out and sprouted, and grew on the ground. There was a heavy fall of snow which remained all winter and until the first of April. The spring wheat which came up the fall previous, did not winter-kill, and many farmers left a few acres to see what it would come to. Mr. G. says, his wheat was cut with a "header," leaving a very high stubble, which he burnt, then harrowed the ground once and left ten acres to grow to wheat. He had 126 bushels of uncommonly fine wheat. He asks the opinion of the *American Agriculturist*, whether it will be safe to use this wheat for seed the coming spring? We should be afraid to risk too much of it. Spring wheat can be obtained by sowing winter wheat in the spring, and continuing to do so until the desired habit is established. But until this habit is formed, there is danger that a good portion of the wheat would not mature. How far this spring variety has been changed into a winter wheat, by once sowing in the fall, is uncertain, and we would not like to risk sowing a large area. Sow a few acres, as early as possible, and if the season is favorable, the probabilities are, that you will get wheat of better quality than the proper spring varieties will yield.

Corn Planter and Manure Sower.

—Mr. J. B. Grinnell, York Co., Pa., wants to know where he can get a good corn planter that drops two rows at a time and sows guano, plaster, etc., at the same time. We do not know of one that we can recommend. There may be one; certainly, such a planter is much needed. On many soils it is very beneficial to drop a little plaster or superphosphate with the seed, to give the plants an early start. This is important on all crops, but especially so with corn. A strong, vigorous growing young plant is almost invariably followed, on good land, by a large yield. Peruvian guano, however, should not be dropped with the seed, as a good article will certainly injure it. Ordinary superphosphate will not hurt any seeds, but there are some superphosphates, which are impregnated with

the liquid from gas-works to furnish ammonia, which will destroy seed, and should be used with great care.

Wheat in Maine.—M. R. Allen, of York Co., Me., wishes "to raise wheat enough the coming season for home consumption," but says, he "is ignorant of the right way to proceed." Soil, a sandy loam. Proposes to use bone-dust or superphosphate. A mixture of superphosphate and Peruvian guano, half and half, would be better—say 100 lbs. of each per acre. If fine bone-dust, 500 lbs. per acre. Sow these manures broadcast and harrow them in before putting in the wheat. Break up the manures fine, and run them through a sieve to take out all the lumps. If mixed with equal parts of sifted coal ashes (not wood ashes), or with fine sand, it will enable you to distribute the manures more evenly. Make the ground as mellow as possible. Spring wheat differs from winter wheat, we think, in requiring a looser and mellow soil. Sow as soon as the snow goes off and the land can be got ready, or else do not sow until rather late. Where the midge is troublesome, late sown wheat sometimes escapes, while that which is sown moderately early, is destroyed. We should prefer, however, to sow early, as late sown frequently gives only a light yield. Make the land rich, mellow and dry; sow early and rather thick—say $2\frac{1}{2}$ to 3 bushels per acre. Threshing, we think, favors early ripening.

Good for Egypt!—"Zero," writing from South Pass, in Southern Illinois, says, that seeing a notice a year or two since in the old Genesee Farmer of a turnip measuring about 8 or 9 inches across, he measured some of his that beat "Father Harris" by 1 inch; but he "thought it would be too bad to brag over the old gentleman about one inch," so he let it go. "But," he adds, "the story I have now I can't hold. Ezra Pierce raised a crop of Strapleaf turnips, a great many among which weighed 10 to 11 lbs. each, and one, 13 lbs. cleansed weight, 'no grease nor dust.' This one measured 34 inches around. Will not 'Egypt' beat the world for large turnips? We have a kind of sweet potatoes, called 'Bermudas,' which weigh 8 to 12 lbs. If you have statements of any big things, please publish them, so as to give us a chance to get ahead another year."

Warts on Cows' Teats.—J. E. Blake, wants to know how these may be removed. If the warts are drawn out, and a waxed linen or silk thread is tied close down to the roots, they dry up and drop off after a while—generally without making a sore. If suppuration takes place, it may be treated like any cut or wound.

Application for Chapped Hands and Calf-bitten Teats.—Dr. "Hoosier," of Rush Co., Ind., sends us the following sensible note: "It is about this time of the year that the young folks, and often old ones, are complaining of chapped-hands and lips. Now, this state of the human economy is quite annoying, especially to the ladies; consequently, almost everybody is hunting after heal-all ointments, and soothing lotions. I have used a simple mixture for many years, with great success. It is made as follows: Take 1 oz. Glycerine, add 15 grains of Tannin, shake thoroughly, and it will soon dissolve. Apply this preparation to the chapped surface, once or twice a day. A few applications will suffice to cure. This mixture is valuable, also, for the chapped and calf-bitten teats of cows. Rub the teats just before milking. It is readily washed off."

Driving Horses to Plow.—W. F. Brown says: "At the West, we always use the single line on the near or left-hand horse, and couple the other by a jockey stick, about four feet long, fastened to the hames' ring of the line horse, and to the bit of the off horse. The jockey stick has a chain about six inches long, at each end, with a T or cross piece attached to slip through the rings. Any patient man can teach a horse in one or two days to go better than with double lines. A pull on the line means *haul*, and a jerk, *gee*. The horse soon catches your idea by these signals, and obeys as readily as by the bit, in the ordinary way. The line is buckled into a ring on a rein buckled to the bit, and passes between the hames, and is kept to its place by the rein that you check the horse's head up with, that being put over it. The rein is held by a loop over the left hand." This method of driving remedies the difficulty complained of by our friend who "walks and talks" on the farm. [Will he please take notice, and will Mr. Brown please try again.—Eds.]

Cooking Food for Stock.—W. F. Brown, of Ohio, recommends the Sorghum pan as the best vessel out for this purpose. He says: "My pan is 11 feet long and about 3 wide at the bottom. The sides, (made of 2-inch stuff) are sloped at an angle of 45 degrees. The sheet iron bottom (No. 18 iron, I believe,) is heavy, and is riveted together, and then nailed on to the wood

with common shingle nails. The pan holds about 250 gallons. The furnace is built of brick, and made wide enough so that the wooden sides of the pan will come just outside of the wall. The flue is made 2 bricks by 3, that is 2 feet by 16 inches, and about 10 foot high, with furnace door and grate. That part of the flue or chimney which is exposed to the weather, should be built with lime mortar, but the furnace will last twice as long if laid up with common clay. The door and space under the pan should be made large so as to take in brush, corn stalks, or any light material for fuel. A quick, blazing fire is better for boiling than one made of solid wood. A large scoop holding about 2 gallons, is very convenient for emptying the pan.—In making mush, have an old broom cut off to within six inches of the handle, and stir briskly with this to keep the material from burning. Put out the fire as soon as the mush is cooked. It will take but little wood, and not over 45 minutes to cook six barrels of mush.—In boiling potatoes, it would pay to have a cover to the pan."

Carrots for Spring Feed.—"M. H. S.," says: Four quarts of oats, with 6 or 8 good-sized Carrots, will go farther in feeding a horse than eight quarts of oats without the Carrots. Alone, the roots are excellent feed for cows in the spring before grass comes. Also chopped fine, and mixed with ground oats, they make the best of feed for sheep having early lambs.

Working Cows in the Yoke.—Chas. W. Treadwell, of Rockingham County, N. H., has sent us a beautiful card photograph of a floral card drawn by a pair of cows, which figured at the late County Fair. He says they use the cows for all kinds of light work, plowing old land, harrowing, hauling wood, etc., and find them serviceable and uninjured in their milk. They are 5 years old, well broken, give 14 quarts of milk each a day. Moderate labor will cause a cow to eat more, digest it better, and probably improve her health were she to be kept in a stable. In the pasture she gets an equivalent amount of exercise, and with it the better health and appetite. Much labor immediately reduces the yield of milk, and impairs the quality of that which is obtained.

Fat Pigs—How to Make Them.—Mr. Allen, of Missouri, wants to know how it is possible to make pigs weigh from 260 to 300 lbs. dressed, in nine months from birth. This is rather more than the average performance of Yankee pigs, but it is by no means unusual, even with the moulge stock found in their yards. The pigs are dropped about the first of March from a large thrifty sow. The mother has a plenty of straw for her bed, and a nice warm sty, with a small yard attached. After she is nicely over the birth of her litter, she is well fed with skim milk, boiled potatoes, and a provender made of Indian corn and oats ground together. This is cooked and is fed warm three times a day, and with great punctuality and as much as she will eat up clean. She never has a chance to waste an ounce of flesh in squealing for her meals. This is a matter of great importance. The pigs fed on such a mother should not be more than six, if to get the best results. The pigs have all the milk the mother affords, and as soon as they begin to feed from the trough, they share her messes, which are increased in quantity as the pigs grow. The rule is to give just as much of the swill as they will eat up clean. On dairy farms they have all the skim milk, and where they can drink in addition to the provender. The pigs are kept growing every hour from birth until they are slaughtered. They sometimes have clover, grass, weeds, or green corn stalks thrown into the pen for a little change of diet, but the staple is the provender and plenty of it. The last few weeks the potatoes are dropped, and they are fed almost wholly on corn meal or raw corn. Pork, thus made, is of splendid quality, and it is by no means uncommon to have pigs so treated weigh from 260 to 300 lbs. dressed, at nine months old.

Raising Calves by Hand.—A California correspondent says: "I have taken calves from one to two days old to as many weeks, and taught them first to drink milk warm from the cow. When they are used to this, add a handful of corn meal, (or better still oil meal), and stir well while they are drinking. All milk may be withheld at perhaps three weeks old, by giving more tea and meal; barley or wheat meal will do perhaps better than corn. Tea is the best substitute for milk, and should be made from good sweet hay, and not steeped too long. If the calves are troubled with scours, stop the meal a day or two, and give a little new milk. If they are constipated, give a little more oil meal or rye meal."

Fine Devon Steers.—A correspondent at Port Byron has a pair that weighed 1540 lbs. at one year old, and 2534 at twenty-one months old. This speaks well for the stock, and for the care taken of them.

Plants by Mail.—It is a great convenience to those who live at a distance from seedsmen and nurseries to be able to obtain plants and seeds through the mail. The ordering of seeds to be received in this way is very common, and, some seedsmen do an almost exclusively mail business. Parcels of plants of moderate size are also easily transmitted by post, and though there have been some loss of plants by this mode of conveyance, it has generally been due either to improper packing or to sending them in too warm a season. But few nurserymen, doing a large business, care to be troubled with small orders by mail at the season when they are crowded with large orders, and we find that it is mainly the dealers in small fruits who offer to transmit plants by post. One of the first to go into the business of mailing plants was Mr. Knox, of Pittsburgh, Pa., and, as will be seen by his advertisement, he is so well pleased with his experience in this matter that he not only offers to mail plants, but to guarantee their safe arrival. His offers of collections of vines, etc., by mail, are worthy the attention of those intending to plant. We received plants from Mr. K. by mail long before we ever knew him, and had reason to be satisfied with the condition in which they reached us. We have before spoken of the extent of Mr. Knox's small fruit establishment, at which there are abundant facilities for producing and packing plants, and his reputation is a sufficient guarantee that he will do what he promises.

Bad for Tree-Peddlers.—At the Annual Meeting of the Illinois Horticultural Society, the following resolutions were passed:

WHEREAS, The progress of horticulture has been very much impeded by tree-peddlers, through their ignorance and dishonesty in selling trees untrue to name, at enormous and unusual prices, sometimes delivered in cold and freezing weather, by which farmers and amateur fruit-growers have been discouraged and disgusted; therefore,

Resolved, That this Society as a body of fruit-growers, farmers, legitimate nurserymen and others, do emphatically denounce the business as empirical and injurious to the best interests of horticulture and the prosperity of the State.

Resolved, That there is no good reason why the authorized traveling agents of reliable nurserymen should not be treated with the same respect as the traveling agents of any other useful business, and that these agents be not confounded with the tree-peddlers.

Standard Dwarfs.—I. H. Ellis, Butler Co., Iowa, says that there are agents selling "standard dwarf" fruit trees, and asks if there is any such thing. A dwarf tree is generally considered to mean one grafted upon a dwarfing stock. Thus, the pear is dwarfed by working on the quince, the apple on the Paradise apple, etc. Trees on free stocks may be made dwarfs by properly pruning branches and roots. It is a matter as much of training as of stock, and we know of "dwarf" trees—i. e., originally on quince roots—that have become standards. The agent who pretends to have a new sort of trees called "standard dwarfs" is not to be believed.

Report of the Department of Agriculture for 1865.—This document is received. It is a volume of 608 pages, in the usual style, full of pictures, with much valuable information and many blunders. We shall, perhaps, take space to review it at another time.

American Seeds.—An importer of English seeds said to us a few days ago that "All American seed raising is a myth." Now we would like to have some statistics about American seeds. We believe that the amount of garden seeds raised in this country is far from being "mythical," and we know that for many things our gardeners will pay any price for American seeds, when they know who raised them, rather than take imported ones. Do Brill, of Newark, N. J.; Gregory, of Marblehead, Mass.; Macomber, of Rhode Island, the various onion seed-growers of Connecticut, the different Shaker communities and others think that seed growing is a myth? As soon as American grown seeds can be had, of reliable growers, the importations will decrease, and here is a profitable kind of culture that our wide awake small farmers will do well to look into. We do not advise ignorant people, who would grow cabbage seed from "stumps," to go into seed-growing, but those who know the conditions necessary to success and who have a reputation for truthfulness, may well give this attention. We know people at the West who will not plant a carrot or a beet seed, unless they know that it has been raised by a "Shaker," so thoroughly has the name of these people become identified with reliability. Flower seed-raising is certainly not a "myth," for we saw last autumn a delivery of 75 pounds of one kind—*Phlox Drummondii*—at Thorburn's, in John St., from a grower in New Jersey, and this was not all of this one kind of seed that he expected to deliver. Does James Vick, with his 23 acres at Rochester, devoted to flower seed raising, consider that American grown seeds

are all a "myth"? There are a few, and but a few, varieties of seeds that can be better raised in other climates than ours; but we believe that the majority of all garden and flower seeds can be raised better here than abroad.

Where Can I Get It?—A letter from Dayton, O., asks: "Where can good seed of all kinds be procured." This is a sample of many letters that are passed by unnoticed, as our advertising columns give all needed information. We do not allow any one to advertise whom we know to be unreliable, or against whom there are strong suspicions. We believe that all advertisers, whose notices are admitted into our columns, will deal fairly, and we cannot recommend one nurseryman or seedsman in preference to another. Buy of the nearest nurseryman or seedsman, if he have the required articles.

Come West is the advice of the St. Louis Democrat to the thousands of unemployed workmen in our Atlantic cities. It says: "A few dollars would place them in Missouri where all kinds of labor are in demand and are paid high wages, where the climate and the soil combine with inexhaustible mineral wealth to offer sure employment and prosperity to a million of industrious workers, and where rich land sells for five dollars an acre. If he does not fancy the cultivation of the soil, pushing railroads are waiting for workmen of every kind. Buildings, going up in every part of the State, are hindered by lack of workmen; mines are lying idle with inexhaustible wealth, scarcely hidden by earth's russet carpet, for want of laborers." This is wholesome advice to the class indicated. New York could with great benefit to itself and to the country spare fifty thousand, who are barely living; here they are consumers and add nothing to the wealth of the country. Their room is better than their company. There the fertile earth pines for their company and would hail their coming with joy. But let the tillers of the soil in the East stay at home, and help us supply the greedy home market.

Whole or Half Sheets.—"O. A. J." asks if it is necessary to write letters on a whole sheet, when a half sheet will answer as well. In all business letters it is customary to use only a half sheet. In other letters, as in matters of etiquette generally, it is difficult to lay down a rule. Those who wish to follow the usages of good society, will write all letters of ceremony, notes of invitation, etc., and will address all officials and dignitaries on a whole sheet, be it large or small. We do not say that this is absolutely necessary, but it is an established custom, as is taking off one's hat in entering a house—and it is better to fall in with it than to appear odd. In some countries the amount of respect of the writer for the recipient of the letter is indicated by the width of the blank margin at the left hand side of the sheet, and we have seen this carried to the extent of leaving a margin half the width of the page.

Unwarranted.—John Vanderbilt & Bros. have sent us a circular of "Hunt's Hoosier Fodder Cutter," in which the *Agriculturist* is made to figure in an unwarranted manner. Hunt's Cutter may be, for all we know, the best in existence, but we have nothing just now to do with that. It publishes, among others, a certificate dated at the Office of the American Agriculturist, and signed by "S. Edwards Todd, Ag. Editor of Am. Agriculturist," etc. S. Edwards Todd is not and never was the "Agricultural Editor" of the *Agriculturist*, (without the *al*), and this use of the name of the paper to give apparent value to any certificate whatever, is unwarranted by us.

Fruit Preserving Houses.—Houses built on Nyce's plan appear to be quite successful. Mr. W. S. Carpenter brought us, about Jan. 20, specimens of pears taken from a house of this kind. Duchesse d'Angoulême and other autumn varieties were as fresh and green as if first taken from the tree.

Noteworthy Catalogues.—A dealer's catalogue may be a mere list of the stock on hand, or it may be a pamphlet of real value and one worthy of preservation for future reference. We have before referred to the efforts on the part of our dealers, in the way of catalogues, and some of them give very useful directions for culture, but are generally inexcusably loose in respect to names. As an illustration of a nearly perfect catalogue, we cite that of André Leroy, of Angers, France, to whose Agents, Messrs. Bruguière & Theband, 51 Cedar St., N. Y., we are indebted for a copy. Though this catalogue is badly translated, we advise our nurserymen to consult it as a model. The fruits, etc., have their names correctly given, the authority for the name usually appended, synonyms, if any, follow, and then, there are columns giving a clue to the quality, size, texture, fertility, time of maturity and form, with a column for "remarks" where these are necessary. All through the catalogue we find the names in accordance with the best botanical authorities, and all

correctly spelled, points in which it affords a marked contrast with any American catalogue we have yet seen. Another pleasing catalogue is that of William Thompson, Ipswich, Eng., in which flower seeds are presented in their botanical families and under their correct names.

Several of our dealers have put out catalogues this year that are more noteworthy for the attempt to render them useful as hand-books, or for the pains taken to illustrate them than for any great attempt at accuracy. Among those useful as giving directions for cultivation, we mention those of A. M. Purdy, South Bend, Ind., and J. Knox, Pittsburg, Pa., for small fruits, and James Vick, Rochester, for flowers. Mr. V. has given a great number of illustrations in his catalogue, and has a noticeably well done frontispiece printed in colors; this catalogue is nearer correct in its names than any that have come to us this year. Peter Henderson's Catalogue of New Plants is also well illustrated, and, as usual, contains all the domestic and foreign novelties. We are always interested in catalogues, as they serve to mark our horticultural progress, and we preserve a file of them with great care.

Documents, etc., Received.—Report of the Committee on Roads, Dedham, Mass. . . The Income Taxpayers' Guide and Pocket Register, F. H. Stauffer, Asst. Assessor, Mt. Joy, Pa. . . Message, etc., of Gov. of Vermont, from H. Clark, Sec'y. . . Index, Charter, and Regulations of St. Louis Public School Library. . . Texas Geological Survey—Preliminary Report—by S. B. Buckley. . . Address by Hon. Anson S. Miller, of Ill., at Saratoga, before N. Y. State Agt. Soc., from Col. B. P. Johnson. . . Report of Sec'y of Iowa State Agt. Society for 1865, from J. M. Shaffer, Sec'y. . . Census Returns of the different Counties of the State of Iowa, for 1865. . . Revelations of the Paraguayan War and the Alliances of the Atlantic and Pacific. . . Message of the Gov. of Michigan, Catalogue of Michigan State Agt. College, etc., from Prof. M. Miles Lansing. . . Report of the State Agt. College, Mich., by the Pres't, Prof. T. C. Abbot. . . A Few Things to be thought of before proceeding to Plan Buildings for the National Agricultural Colleges, from the author, F. Law Olmstead.

Catalogues Acknowledged.—All dealers will find it to their advantage to send us catalogues of their stock, as in preparing the list of nurserymen and others for our Annuals, we only include those who take pains to make themselves known. Some of the catalogues issued this year are very creditably illustrated, and many of them are valuable as hand-books upon the management of fruit, vegetable and flower gardens.

AGRICULTURAL IMPLEMENTS.—John Vanderbilt & Brothers, 23 Fulton St., New York. . . Griffing & Company Agricultural and Horticultural Implements, 58 and 63 Cortland St. N. Y.

GENERAL NURSERY STOCK.—Walnut Hills Nurseries, J. S. Cook, Cincinnati, O. . . "The Evergreens," Saml. Edwards, La Moille, Ill. . . J. C. Plumb, Madison, Wis. . . Walworth (Wayne Co., N. Y.) Nurseries, T. G. Yeomans.

GRAPES AND OTHER SMALL FRUITS.—South Bend (Ind.) Nursery, A. M. Purdy. . . "The Best Three Market Berries," (Ill.) William Parry, Cinnaminson, Burlington Co., N. J. . . A. M. Burns, Manhattan, Kansas. . . A. J. Hatfield, Niles, Berrien Co., Mich. . . Alfred Wells, Ithica, Tompkins Co., N. Y. . . Holton & Zundell, Haverstraw, N. Y. . . J. Knox, Pittsburg, Pa.

The American Naturalist.—This is the title of a new popular illustrated magazine of Natural History, to be published by the Essex Institute, Salem, Mass. It will be issued monthly at \$3 per year. The list of persons who have promised to contribute to its pages comprises the names of those who stand at the head of their different departments of science. Some half dozen periodicals, devoted to popular science, are published in England, but, with the exception of the Practical Entomologist, we have not one in this country. The American Journal of Science serves as a medium for scientific men, but one which should aim to popularize science is greatly needed, and if the one now proposed is well managed, it will meet a long felt want. We wish this enterprise much success, and advise such of our readers as desire to know more about it to send to the Editors of the American Naturalist, Salem, Mass., for a circular.

Walks and Talks on the Farm—No. 38.

My best paying crop on the farm last year was Beans. They cost but little labor and bring a good price. I have just sold them to the seed-store for \$3 25 per bushel. The early kind turned out better than last year, but the late sort was nipped by the frost, and is not so good. I had to have them picked over by hand at a cost of 15 cents per bushel.

Beans have always been, theoretically, a favorite crop with me. And I am now more than ever convinced that, on wheat farms at least, they should always form a part of the rotation. True, we cannot always hope to get such a high price for them as they have brought this year. But I think they will pay to grow even for feeding out on the farm to sheep. They are very nutritious, and nothing except oil cake makes such rich manure. The vines are excellent fodder. I was fortunate in getting the crop well cured. The growth of vines was unusually large—completely covering the ground, and though the frost struck them before they were pulled, I find that the sheep ate them with avidity. In fact, they seem to like them fully as well as clover hay.

John Johnson writes me that he is fattening over three hundred sheep. Like nearly all of us, he paid more for them than they could have been bought for later in the season. But he thinks that there is not *one eighth* as many sheep being fattened this winter as last, and consequently they are likely yet to bring a fair price. He urges me to feed a little oil cake, and I am doing so. I bought a few tons of it at \$50 per ton. It is a high price, but less than it has been for several years. If it were not for the manure I question if it would pay. But if, as Mr. Lawes estimates, the manure from a ton of oil cake is worth \$28, and you can buy cattle or sheep ill-fed for two or three cents less per lb. than you can get for them when fat in the spring, we may be sure that we can afford to buy oil cake enough at least to use up all our fodder.

Feeding straw and stalks alone to any kind of stock is of rather doubtful economy. We must feed a little grain or cake with it to get out its full value. With hay, the case is somewhat different, as it contains both grain and straw—or rather, it is cut while all the juices which would go to form grain are still in the stems and leaves. But for fattening animals, it is still desirable to feed out a little grain or roots in addition.

Farmers feel the high taxes this winter more than ever before. They are higher in this town than at any time during the war. The effect, as a general rule, is to check improvements. There is less work being done than for some time past, and wages will come down. But it is no use holding back. The taxes must be paid, and we shall have to get the money out of the land. If we stop work we shall be worse off instead of better. After all, the money paid for State and county taxes does not leave the country. It soon finds its way back again into circulation. If farmers only had to pay high taxes, or if they were merely local, it would be all loss and no gain, but as they are general, all over the country, we will not complain. Let us lend all our energies to make the land as productive as possible, and we shall find it less difficult to pay the high taxes than we anticipated. Our County, State and National debt is really a mortgage on our farms, but as every body's farm is thus mortgaged it does not affect any one farmer as an

ordinary mortgage would. Let us be cheerful then, and keep on working. The prospects of farmers are as good now, compared with other occupations (except office holders), as ever.

How much do you suppose I paid the Doctor for that cow? One hundred and ten dollars! I am a little ashamed of it, but try to persuade myself that I should not have given so much to any one else. She comes in very early, is a well built cow, with a trace of Shorthorn blood in her, and is in high condition. The latter point I think more of than the generality of farmers. I like to see a milch cow pretty fleshy in the spring, for if she is a good milker you will get all the fat she has stored up during the winter back again in the form of butter before the season is over. This cow gave, last summer, two lbs. of butter a day. And if she will do this for me, I would rather give \$120 for her than \$60 for one that will give only one pound of butter a day. For of course she will not eat *as much* again food.

The high price of cows will prove a boon to farmers if it teaches us to feed our milch cows better. In the dairy districts I presume they have paid more attention to this point, but there are not a few farmers that have treated their milch cows and young stock during the winter months as though they did not care whether they lived or died. And even now, while cows are so scarce and high, I can take you to several farmers in this "highly enlightened community," in this "centre of the garden of the Empire State," where cows, colts and young cattle are wintered in the field with no other shelter than a rail fence!

Neighbor Sloe has sold all his straw to the paper makers, and now lets his cattle run in the fields to pick up what grass they can find under the snow. It's a *fact*.

I was glad to see the *Agriculturist*, last month, recommending currying cows and fattening cattle. Animals that are stabled need it more than those in the yards, but it is beneficial to both. When I want a little recreation I take a curycomb and card the cows. They like it beyond anything. I have seen them stop eating their corn meal as soon as I commenced. I wish the practice was general. A man that curries his cows will not be apt to starve them.

There is another thing in the *Agriculturist* this month (January), that I like—the allusion in "Hints about Work," to future prices of farm products. We are all interested in this matter, and there is no way in which the *Agriculturist* could benefit its readers more than by giving all the facts which have any bearing on the subject. Of course, no one can predict with any degree of certainty what prices will be a year or a month from this time, but still some idea can be formed by a careful consideration of the facts. But the difficulty is to *get the facts*. These the *Agriculturist* could give us even more fully than it now does. The advice it gives to "sell when you can get a fair price" is certainly correct; and, on the other hand, hold on to any article that is below the cost of production, if there is a chance for a rise.

"What do you find to do on the farm in winter?" asked a city friend. "What do you people in the city *ever* find to do?" I replied. Whatever sources of discontent there may be in farm life, want of occupation is not one of them. I do not pretend to do much work myself. I would like to do more than I do, but cannot afford it. There are but few men who

can work both with their hands and their brains. But there is no lack of work for man and horse, provided it is properly laid out. In stormy weather you can grind grain, chaff fodder, thresh beans, and if you have a tool-house, with a stove in it, you can repair tools and implements, paint wagon wheels, cultivators, harrows, plows, &c., and get everything ready for spring.

We have been latterly busy drawing stones to build fences. There are hundreds of tons of stones on my farm that have been taken out of the land and drawn into large heaps. It is no little labor to draw these stones on a wagon or a stone-boat in the summer, even if we had time; but with sleds it is less work to load, not having to lift them so high, and you can draw a much heavier load. In the summer time it would cost me nearly as much to draw the stones as to build the fence; and when the ground is wet in the spring and fall it is still more expensive, and, besides, injures the land. It is rather cold work handling stones, but the winter is *the* time for moving such heavy materials.

Did I tell you of a discovery the Deacon made last summer? He has a small ditch running through one of his fields which carries off the water from ten or fifteen acres of my farm. Last summer he observed that there was a hole in this ditch into which the water soaked away. He took a crow-bar and enlarged the hole. I have two long underdrains discharging into the ditch, and during the heavy rains of last fall there was a great quantity of water discharged, but this hole *took every drop* of it. I presume the hole goes down to a fissure in the rock. If it was opened out and then stoned up so as to prevent choking, I see no reason why it should not prove a permanent outlet for all the water. There is on my farm a low spot from which there is no outlet, into which flows a considerable quantity of water, which all disappears.

The great difficulty in draining is to get a good outlet. There is scarcely any land that cannot be readily drained if the natural water courses were kept free from obstructions, and the ditches which run into them were deepened and widened and kept clean. But as this must be done by the several farmers through whose land the water courses run, any one of them can seriously damage all the rest by his negligence or obstinacy. This matter demands the immediate attention of our legislators. A well considered law, compelling farmers to clean out water courses, &c., or in case of refusal authorizing the proper authorities to do the work and assess the expense on the property benefited, would do much for agricultural improvement.

The Deacon last night was telling me of an interesting fact in regard to wheat, which he observed on his farm some years ago. He and another farmer had bought some wood which lay back of my present farm. By going across my farm they could save a mile or so of travel. They obtained permission from the owner to draw their wood during the winter, on condition that they should pay for any damage done to a piece of wheat they had to go over. Before spring the snow broke through occasionally, and they expected to have to pay considerable damage. But during the summer the wheat on the track was far superior to the rest of the field. The snow being pressed hard, did not melt in the spring for a long time after it had all disappeared from the rest of the field. There may have been some droppings from the

horses, which could have done no harm, but still I have no doubt it was the late coming of snow and ice in the spring that was of so much benefit to the wheat. "At harvest," said the Deacon, "the wheat was so good that the men told me they got all their hands from this track to tie up the bundles from the rest of the field."

But what a wretched picture of farming is this—the straw not long enough to tie up the wheat! This, mark you, was on the farm I now own, and if I ever have a crop of wheat that I cannot bind, it must not be ascribed to "book farming." For my predictions certainly are not open to such an accusation. If not strictly "practical" farmers, they did not ruin themselves by taking agricultural papers or farming according to the books. Some of them spend more time at the card table and the grog shop than I do in my library. Those of my good friends who shake their heads at some of my performances will agree with me in one thing: It is better to buy bone dust than whisky; better to spend your evenings at home, reading the experience of the best farmers of the past and the present than to be expending the hours in smoking in a grocery at the "corners."

I do not know a more striking instance of the benefits of drainage on a small scale than one not half a mile from me. A city man, three or four years ago, bought a farm of some seventy-five acres. The house was situated on the top of an easterly slope, some forty or fifty rods from the road. He moved out to the farm the 1st of May. The young ladies, who had had no experience of farm life, came out in a carriage, and when they came to turn up the private road that led to the house the horses mired, and the driver had to get out, and lay down rails for the ladies to walk on across this mud hole. Their feelings can be imagined. A quite respectable family had lived on the farm since the county was first settled—lived, thrived and died. They had pulled through that mud hole for thirty or forty years, without any attempt to drain it. Our city friend immediately cut a ditch along the side of the road a distance perhaps of fifty rods, down to a natural water-course. He then put in some three or four underdrains, running up and down the slope in front of the house, and which discharge into the new ditch. The affect was magical. These underdrains run winter and summer, day and night, and carry off all the water. The meadow is one of the handsomest and most productive in the neighborhood. The young ladies have surrounded the house with evergreens and ornamental trees and shrubs. The mud hole has disappeared, and in its place is a nice gravel road, firm and dry at the wettest seasons of the year, and I question if the whole expense of the improvement amounted to two hundred dollars.

"But did your city friend make farming pay?" Yes, Sir. He has received more money from his apple orchard alone than he paid for the farm! He has everything very comfortable around him, is an active, energetic man, cultivates his land thoroughly, raises large crops and enjoys farm life—well, about as much as I do.

I am glad so many city people are turning their attention to farming. The country needs new blood. But there can be little doubt that many of these new comers will soon leave us. I have a neighbor who came from the city last spring. He bought a farm that would be productive if thoroughly underdrained, but without, it is not worth cultivating. He has worked

hard all summer, managed the land as well as any one could, but his corn was not worth husking, and the whole farm receipts were so small, he is about to return to the city in disgust.

Our agriculture has much to hope from young men who, having a love for farming, the necessary capital, a good education, and abundant energy, make up their minds to study farming at some Agricultural College, or with some good practical farmer, and then settle down in the country for life, determined to "make farming pay." It will not be many years before our Agricultural Colleges turn out hundreds of such men. And the more of them the better.

Milking Stools—A Hint.

We published some time since an article about milking stools, which brought several communications in regard to them, among others, some advocating the use of one-legged stools. These are very common articles of cow-yard furniture in some places, but probably unused in others, they have their advantage, however, upon side hills or uneven ground.

There are multitudes of people who use 3-legged stools while milking, for the very good reason that they will stand firmly wherever they are set down. And if the idea of a one-legged stool were suggested to them, it might not be entertained for the reason that such a stool will not stand alone. The quality of firmness is good, but that of being level is better. A one-legged stool will be level, or as nearly level as the milker wishes, at all times, and to enforce this fact we have had this illustration made. The artist has probably never milked a dozen cows morning and night, winter and summer, during some of the best years of his life, or he would have given his milkman a better position, and provided a bigger pail for the *show* of milk.

Convenient Tools in the Garden.

There are some implements very convenient and even necessary to have in the garden that are not usually kept by the dealers in garden tools, and they must be home made, if had at

Fig. 1.—ROLLER.

all. At this time of comparative leisure it is well to have all the tools repaired and to purchase or make such as are likely to be wanted.

A ROLLER of some kind is an implement so useful that no large garden should be without it. Those of iron, for rolling gravel, are too

heavy for the main purpose for which a roller is required, that of rolling the soil after sowing seed. Figure 1, shows the form of roller used in market gardens in the vicinity of New York.

It is a cylinder of hard wood about 5 feet long and 9 inches in diameter. It is bored through its whole length to receive a rod of 2-inch round iron; this rod makes the roller sufficiently heavy, and being a few inches longer than the roller, its projecting ends furnish arms to which to attach the handle. It is of great importance, after sowing seeds, to pack the soil closely in contact with them, or to "firm" it, as the gardeners say. In a small way this can be done by means of a strip of board, but when a large sowing is made, the roller is necessary. Moreover, the smooth surface left by the roller allows the first hoeing to be done with greater facility, than when it is left lumpy and uneven.

THE MARKER is another very convenient implement, used for tracing lines upon the surface of the ground, as a guide in setting plants or for making drills in which to sow seeds. The double marker shown in figure 2, has one set of teeth at 9 inches apart, and another at 12 inches distant. A marker of this kind will lay out lines at the distances ordinarily required, as by using every mark, or every alternate one, we can have rows at nine, twelve, eighteen, and twenty-four inches distant as may be needed.

Fig. 2.—MARKER.

THE CULTIVATOR most in use in our market gardens is simply a harrow, made in the form of a cultivator, and adjustable to different widths.

Fig. 3.—CULTIVATOR.

The teeth are like ordinary harrow teeth; and when unusually deep culture is required, a weight is put upon the implement to make it enter the soil to a considerably greater depth.

THE DIBBLER, or Dibble, fig. 4, is of great use in transplanting. It is made from a bit of hard wood that has a convenient curve to fit the hand, and will be all the more durable if the point is shod with iron. The foregoing engravings are from Mr. Peter Henderson's new work "Gardening for Profit."

A GARDEN LINE is necessary where one would lay out his work with accuracy, and a wooden reel may be made to wind it upon. The iron reels, as generally sold, soon get out of order and become useless. We have found two stakes of hard wood, properly pointed, to be more satisfactory than any kind of reel. One of these stakes is made fast to each end of the line; when not in use the line is wound upon one of the stakes in the manner that a boy winds up a kite string.

Fig. 4.

The Beaver—(*Castor Canadensis*.)

The beaver is another of those interesting quadrupeds which the march of civilization exterminates. We are reminded constantly of the fact that they were once abundant throughout the Northern States, by the creeks, ponds and meadows which bear the marks of their wonderful engineering. It is a pleasant fancy that all the trades have their representatives among the brute creation; the Beaver is the civil engineer. Old beaver dams still stand, and, in not a few locations, are now busy mill-sites. The accumulated deposits of silt and rubbish carried down by the dammed-up streams, and deposited in the slack water above the dams, form more permanent monuments to the beaver's industry, than the dams, which have, in the most cases, rotted and been washed away, while the deposits above them have become covered by swamp vegetation, and, as "beaver meadows," perpetuate the memory of the industrious colonies once established upon them. The Beaver belongs to the family of the *rodents*—gnawers—distinguished by two pairs of very strong, sharp, cutting, front teeth. They are found in both hemispheres, but most abundantly in North America, and are hunted and trapped for their fur, which is very valuable if taken in the winter season. They are from 2 to 3 feet in length, exclusive of the tail, which measures about a foot, is of oval form, flattened laterally, and covered with semi-horny scales instead of fur. The hind feet are webbed; but the fore-feet are not. The body is low, squat on the hind feet, the ears small and rounded, and the fur is exceedingly fine, soft and close, thickly interspersed with coarse hairs. These

hairs are removed by the process of "plucking," when the fur is prepared for use.

It is absurd to exaggerate psychological qualities in animals, especially if so remarkable as those possessed by the beaver. Nevertheless this has been done by most of the old writers who have listened to the trappers' marvelous tales. Beavers act in concert in felling small trees and floating them, and logs cut from them,

down stream to form their dams. The trees are anchored by stones and gravel piled upon those parts of their tops which rest upon the bottom; and the dams are finished by building-in logs, stones and boughs, the interstices being filled with gravel and mud. The dams are built or repaired in the summer when the water is low, and in the autumn the beavers, in families of 4 old, and 6 or 8 young ones, construct their houses,

THE BEAVER.—(*Castor Canadensis*.)

which are made of sticks, stones and mud, piled in a broad circle, a chamber about 7 feet wide being left in the center, the floor of which is above usual high water. As the structure rises, it is contracted into a dome, the cavity being about 3 feet high, and the thickness of the walls above

Beavers are not only valuable for their fur, but for the drug *Castor*, or *Castoreum*, which is found in sacks near the root of the tail, and is used in medicine. It is used also by the hunters as a means of attracting beavers to the trap.

Beavers are easily domesticated, and as their food is willow bark, they might perhaps be economically bred and fed on the bark stripped from willows used for basket making. If not

domesticated, this interesting animal will soon be extinct in the United States.

Shrew Mole and Star-nosed Mole.

The common American Mole is the Shrew Mole (*Scalops aquaticus*), though the Star-nosed Mole (*Condylura cristata*) is not rare. The former is found in many gardens and fields where it does much benefit by destroying grubs and worms in the soil, and some harm also in disturbing the roots of plants by its subterranean galleries. The question whether moles are, on the

whole, friends or enemies, is worthy of discussion. For our own part, considering their most ravenous appetites and the great amount of food they require to sustain life, which may easily be seen when one is caught alive and fed, we are inclined to regard them as friends. The

family name, *Talpidae*, covers a number of similar genera in different parts of the world. They agree in living a short distance below the surface of the ground, having stout, clumsy bodies, without apparent neck or external ears, exceedingly small eyes and short legs, the fore-feet being generally very broad and armed with strong claws. In all, the senses of smell, hearing, and feeling, are very acute. They are able to move swiftly about in their galleries, and to extend them with great ease and rapidity. The fur of the Shrew

SHREW MOLE, (*Scalops aquaticus*), AND STAR-NOSED MOLE, (*Condylura cristata*.)

and around being often from five to seven feet.

The entrances to these lodges are all below the water level when the dam is full, and near and about them canals and channels are formed which communicate with their stores of food, which consists of the bark stripped from the logs used for their dams, and that of logs and boughs of the willow, aspen, poplar, and other soft wooded non-resinous trees.

Mole, and of moles in general, is of exquisite fineness, and lies in no particular direction. The Star-nosed Mole has coarser fur, and the termination of its snout is a very remarkable fringe of fleshy points. We have besides, three other moles in the United States, the *Silver Mole* of the Prairies; the *Hairy-tailed Mole* of the New England and Middle States, and the *Oregon Mole* found all along the Pacific coast.

Dealing in Fancy Poultry—Poultry Clubs.

In common business transactions, the buyer is generally expected to decide for himself whether quality and price in the thing he buys are such as to make the purchase desirable—and the practice of “beating down,” is as old as the time of Solomon, who wrote, “It is naught; it is naught,” saith the buyer—and when he is gone then he boasteth.” But when a man orders by mail, and sends the money in advance for a good article which he expects to receive by express, he throws himself entirely on the honor of the seller. This is the usual way of buying the different kinds of fancy poultry of professional breeders. No one would think of buying a horse in this way, except of a tried friend, or of a dealer of proved honor, or of such a reputation that his interest would tally with his integrity, and we are sorry to be obliged to rank poultry dealers and horse dealers in the same class, with a few honorable exceptions.

Many people buy fancy poultry, who do so for the sake of gaining by experience a knowledge of the breeds and their qualities. In their orders they exhibit their ignorance, and the dealers take advantage of this, demand pay in advance, and send fowls utterly worthless as breeders. Some of these breeders of fancy poultry are so ignorant as actually not to know how to select the best birds of their own flocks, and will actually breed from accidental crosses to keep up their breeding stock. This is true of a Jersey breeder who sells many fowls in N. Y. City by auction, and otherwise advertises extensively. Birds bought of such an one will only by accident give satisfaction. We saw at the N. Y. State Fair some fine Black Spanish fowls, and a friend ordered some on the strength of our statement of the excellence of the parent stock. They came and were worthless for breeding purposes, fit only for the pot or for layers. There are several places in New York City, where fancy poultry are kept caged for days and weeks. People who buy fowls or turkeys from these pens, or dens, will be almost sure to carry vermin and disease (roup) to their yards.

In a dealer in fancy poultry, ignorance of what constitutes a pure-bred fowl, or a healthy fowl, or a well shaped fowl, is a crime. It causes fraudulent dealing. He knows that he inevitably, in his ordinary course of dealing, must cheat his customers, and besides send disease and death among their fowls at home.

Fowls bred from the best stock will not always be equal to their parents, and in many cases those a little inferior may not communicate their bad points to their offspring; these therefore, have a value above common “dung-hills.” The nearer birds approach the ideal of perfection, the higher should the price rise. The breeder who would set any price for the very best, and selling, continue to breed from his own inferior stock, should be tabooed.

Know what you want, and see before you buy, or before you pay for what you order; if you order by mail and receive by express, is the best advice we can give. Breeders who know they send a good article will not object to this practice. They sometimes suggest it. We have known of some who requested purchasers, if not pleased, to replenish the food and water stores, clean out the coop, and return the birds.

The remedy for much of this cheating is the association of poultry fanciers, in correspondence, and in visiting each other's yards, in poultry clubs, and in other ways. We are now too much

every man for himself. The Grey Dorkings have often proved failures in this country for want of the ability of breeders, by exchange or otherwise, to get fresh blood. They do not bear in-and-in breeding, and the same is true of much other poultry. We recommend, therefore, the formation of Poultry Clubs, or other associations of amateur poultry breeders.

Impurities of Cross-bred Drones.

BY BIDWELL BROS., ST. PAUL, MINN.

The best Apirians, both in this country and Europe, consider that a pure Italian queen, in mating with a less pure or black drone, though producing cross-bred queens and workers, will nevertheless produce pure Italian drones. In our experience we have not found it so.

The great multiplication of Italian bees in Europe as well as America, is by what is termed Italianizing, that is, removing a black queen and substituting an Italian in her place. Her progeny in time replace the black bees. Queens for the remaining hives of the apiary are reared by removing the Italian queen and compelling the queenless bees to rear one or more “forced queens” from her worker eggs or larvæ. After hatching, these fly out to meet the drones, which at that time are for the greater part black drones, the progeny of the previous black queens, or belonging to neighboring hives. The drones of these “hybrid queens,” so-called—(Italian queens which mate black drones), are claimed to be pure Italians, and are allowed the second season to mate with queens subsequently reared from eggs of the original pure queen, thereby affecting, we claim, in a degree, the greater part of the apiary.

In bee-breeding these facts are established, viz.: Queens that have never met the drones will lay fertile eggs which will all hatch into drones. Queens never meet the male but once, and after this they are called “fecundated queens.” Their eggs are directly influenced by the fecundative principle, or not, at volition. Those eggs which are thus fecundated produce workers or queens; those which are not fecundated, as is the case with the eggs of the non-fecundated queens, produce drones. From these premises, and from the fact that an Italian queen crossed with a black drone produces drones more or less closely resembling pure Italians, apirians argue that the drone progeny must be of the original purity of the virgin queen, and advise the use of such drones in apiaries.

Now, we claim that a pure Italian queen, in mating with a less pure drone, or with a black drone, is tainted, and remains a cross-bred ever after. Certain it is that the seed of the drone forms a part of her system, requiring the blood or fluids of her body to circulate into it and back into her for its nutrition and development.

An Italian queen having mated an Italian drone, produces handsomer, and hence purer drones than similar and sister queens having mated black drones; this we have observed in many different apiaries. Our experience on this point is as follows: In raising Italian queens in the summer of '65, the first queen that mated with a black drone produced drones of an inferior color, and apparently less pure than those of sister queens mating with Italian drones. We were compelled to remove her from our apiary. We repeated the experiment afterwards with similar results. To prove that this queen must have mated with a black drone, we offer, that, 1st, its mother was the only Italian queen

within 20 miles, and the nearest cross-bred queens were 18 miles; 2d, black drones were in an adjoining apiary; 3d, the queen was one of 5 sisters reared from the aforesaid queen, all hatching on the same day, and reared from eggs laid on the same day, and their brothers (the drones) were hatched 6 days before them; 4th, 4 of the sisters, after impregnation, all produced progeny similar to their mother, and this one different. Fertile Italian workers, and unfecundated queens, have better drones than queens, reared from similar eggs, and mated with a black drone. Another marked characteristic of such cross-breeding is, that the bees are more irritable and unmanageable. Continued cross-breeding with only occasional additions of strains of black blood, together with the imperfections of forced queens and drones, will rapidly reduce the standard of purity of Italians. The evidences of this degeneration are unfortunately too apparent in very many apiaries.

Bringing up Worn-out Land.

It is ever and anon asserted that the only systematic and intelligent way to bring up land that has been run down, is to have the soil carefully analysed by a professional agricultural chemist, to ascertain the lacking mineral ingredients, and then to purchase and apply the same.

Theoretically, this is all very well. But let us remember two or three things. It will be necessary to analyse nearly every field of a farm, if not different portions of the same field, because the soils will be more or less unlike. Then, too, these analyses are expensive. And lastly, they are very liable to fatal errors.—Prof. S. W. Johnson writes: “I do not doubt that in many cases a careful investigation of a soil—chemical, physical, and historical—by a genuine scientific farmer, one familiar with science and practice, would afford safe and nearly accurate data for its proper treatment. But this would be always expensive, and in nine cases out of ten, would not pay. Soil analysis, at the best, is a chance game; and where one wins, a hundred may lose.”

Instead, then, of looking abroad for some special process of reconstruction, let the farmer turn to the farm itself and his own brains, and see what they can do. If our farm is exhausted, it is because it has been abused, and to restore it, it must receive kind treatment. Let us see. Some parts of it may need draining. Other parts will need deeper plowing, and all will doubtless need more manure and cleaner tillage.

The owners of such farms generally complain that they have not manure enough on their premises, and can not afford to buy more. Then let them try plowing under green manure, such as peas, buckwheat, and, best of all, clover. Marvelous results have been achieved in this way. And muck has done and will yet do as great wonders. Many a farm has a bed of this, and whoever has it, has a mine of wealth. Get it out every leisure day, and after it has drained, stack it up with alternate layers of lime or ashes. In a few months, it will be nearly as efficacious as so much barn-yard dung. Dr. Dana classes it with cow-manure in value. Now, these two sources of fertility are enough, with deeper plowing and cleaner culture, to set any “worn-out” farm on a career of improvement. But, as “every little helps,” the farmer should save the droppings of his poultry-house, the slops and waste from kitchen and chamber, the contents of the privy, all bones and chips and

sods and leaves:—in short, whatsoever will decay, and so become a fertilizer. These several items amount in the aggregate to a good deal in a year's time. And the farmer who neglects to save them should be ashamed to complain of his worn-out land. It is by economy of this sort that some of the poorest farms of the country have been reclaimed and made profitable. And there are many more waiting to be reclaimed by just such simple means. There are farms, however, which this will not regenerate, and these in 99 cases in 100, need bone-dust. Green manure and bone-dust will cure 9-10ths of the ills that well drained and plowed land is heir to. Lime is often a great help, and ashes still better. These facts are easier learned by experiment than by chemical analysis. *

Manures—How and When Applied?

A long established custom—a “rut” that the wheels of every-day practice have run in for years, has something which entitles it to respect. We should not switch off upon a side track, or no track at all, just because we find ourselves running our practice in the old ruts. These were formed probably for some good reason, and should be departed from only for a good reason. The interest in the subject of manuring land is increasing over the whole country, even on the rich prairies, where the ideas advanced from time to time by the *Agriculturist*, have so often provoked derision, manure is getting to have a recognized value; everywhere else it is the very life of farming. It is gratifying to hear a farmer say, “Five years ago, do the best I could, I could not make over 70 loads of good manure, but now I keep double the stock I did then, and make 300 loads of better quality.” Such a man can not leave the accumulations of the whole year until April and May before he gets it out, but there must be a system of almost constantly getting it to the field, and getting it under ground. The farmer whose remarks we quote, has, on an average, 25 ox-cart loads of manure per month to dispose of.

For some crops, corn for instance, manure may be applied fresh and plowed in. For others, as flax or wheat, such rank manure would be fatal to a good crop. Applied in the autumn, manure will generally become so incorporated with the soil before spring, that its rank character will be entirely lost, and if examined it will be found much of the consistency of manure that has lain 6 months or more in the yard.

For corn and root crops, it is best to have the manure diffused through the soil. For wheat and the other cereals, the upper layer of the soil to the depth of say 4 inches, should contain the manure applied, especially for that crop. There are two ways of securing this surface enrichment, which, in the case of the small grains, should never consist of rank unfermented manure. One way is to make a compost, work it over, and when of a uniform consistency, apply it on the plowed surface and harrow it in, or work it in with a cultivator. The other is to plow in a good dressing of manure spread evenly over the surface, turning it well under. If this be done in autumn, the spring plowing and harrowing, if done aright, will bring it again to the surface, well incorporated with the soil, and making usually a nice seed bed. If it be done in the spring, a crop of corn or early potatoes may be raised, or on some soils a summer small grain crop, and the manure be brought to the surface for the especial benefit of a wheat

crop in August or September.—There are such great differences in soils, exposures, and the general adaptation of districts to certain crops, that only general rules will apply universally.

“Inquirer,” who omits the State from his address, says it is customary with farmers in his neighborhood to manure in spring, on corn stubble for oats, and follow with wheat, seeding to clover and timothy. This to be followed by corn. Sometimes, it seems, the oats grow rank and lodge, but usually the crop is good. The reason evidently is that sometimes they plow the manure in so deep, the oats get but little, and if the plowing is too shallow, they fall badly. When they manure before plowing for wheat, the clover and timothy do better than when the manuring is before plowing for oats, but the wheat is not materially affected. Instead of this, try coarse manure and plenty of it for the corn—none for the oats, a fine compost for the wheat kept near the surface. The rotation is not a good one, but we are not on that subject now.

Dead Animals—What Becomes of Them?

We do not eat horses and mules, and we eat only a portion of cattle, sheep, and swine. Without considering the immense waste of offal which take place in the slaughter houses all over the country, from the little “one-horse” affairs of the villages, to the monster abattoirs of the cities, where good sized brooks of blood flow out to be lost, think of what becomes of the horses, etc., the whole number of which in the United States may be estimated at 10,000,000.

Their average age is, say 12 years, and the weight of those that die, about three to the ton. We have then annually the immense amount of 280,000 tons of dead horse-flesh, nine-tenths of which is worse than wasted, being left on the surface, or so slightly buried that it is dug up by dogs, and pollutes the air for miles around. Its value, where barn-yard manure is worth \$1 a load, is not less than \$10 per ton, for if properly managed, it will make not less than 15 loads of good manure, and where manure is worth more, the value is of course proportionally increased. The way to save this waste and economize it as manure, is as follows:

Take 3 loads of dry, weathered swamp muck mixed with lime, in proportion of 1 bushel of slaked lime to the load, as a bed—on this, kill the old horse, or drag the dead one. Then skin him; remove hoofs and shin bones, if you have a market for them, and cut him up with axes and knives into pieces weighing 6 to 18 pounds, leaving the big bones uncut, but dividing the principal joints. Spread the pieces evenly, sprinkle well with lime, cover 6 inches deep with muck and add more lime. Then cover with a foot or 18 inches of muck, and leave it. Look out for dogs; they will frequently dig out the bones, and see how many you can add to the heap. After about 3 months of warm weather, or 6 months or more of cold weather, examine the heap to see if it is well decomposed, and as soon as it is in such a condition as not to be particularly offensive, work it over, adding more muck, without lime. A new fermentation will commence, and when this is over, the manure will be fit for use. In shoveling it out, the big bones should be thrown to one side, to be put into another compost heap, or into the horse-manure heap, where they will gradually decay, so as to be easily broken up with a sledge hammer, or even mashed with a shovel; this takes some time, however. The labor is not great to pitch them out and work them over

again, and finally the land gets their full value. If at any time the odor of ammonia is perceived, gypsum should be sprinkled freely over the heap, and more muck thrown on. If muck is not to be obtained easily, use sods or bogs which have been laid up with a little ashes or lime until they crumble, or even good soil may be used with almost equally good results. The manure resulting is excellent for corn, potatoes, or grass, and if not too strong, and if it has lain long enough, is good for wheat or any purpose.

Like Produces Like—Old Mares as Mule Breeders.

This law prevails in the vegetable and animal economy. Would that farmers always bore this in mind, and practised accordingly. It seems to be well understood that if we would maintain and improve the quality of our corn and wheat, and other grains, we must save our best each year for seed. But in raising stock, in numerous districts in our country, less care is taken. Every year we see calves raised from the meanest scrub and grade bulls, and cows of no especially valuable qualities either for flesh or milk. Every year we see poor old broken down mares used to raise horses from. We do not suppose that all diseases and infirmities are propagated from one generation to another, but many are; and where no specific disease is entailed, general inferiority certainly descends, which sooner or later will breed many evils. It is no doubt true that bad management and harsh usage will spoil the best descended colt; but a colt propagated from a diseased dam will break down under work and exposure much quicker than one of sound and vigorous parentage. It is abundantly proven that the various diseases of the wind passages are quite likely to be propagated. Readers of the *Agriculturist* will make note of facts like these, and practice accordingly in raising stock; but there are thousands who do not read, and who live and work on in needless ignorance of their own interests. Quietly argue with such people, and prove by your own experience that it pays over and over again to use thorough-bred bulls and rams, and the best stallions and mares for stock, and show the man that says, “the old mare is pretty well broken down, I know, but I can get two or three colts and some work out of her yet,” that the colts which cost him \$100 to \$150 each to raise, if from a sound and fine dam, and by a superior sire, might sell for \$300 to \$700 a piece, instead of barely bringing their cost, if even that—the difference being two or three times what the old mare is worth. There is one use for which we commend old mares that cannot work, and can breed, and that is for raising mules. These will indeed, to a certain extent, inherit the impaired constitutions of their dams, but being prevailingly used for so much slower work, they will be much less injuriously affected than horses, while their evil stops with them. We might profitably make a much more extensive use of mules than we do at the North, and there is a steady demand for young mules for shipment. While we object to prostituting our best mares to this purpose, as they used to do in Kentucky with their fine thorough-breds, yet we believe there are thousands of mares that would raise good mules, that it would never pay to raise colts from; and that the mules would bring a much higher price than horses raised from the same mares. Certainly they would, if we regard the fact that they may be marketed 2 to 3 years old.

How to Bring Swamp Meadows into Tame Grasses, etc.

First, shut off the water. This we discussed with considerable detail in our last year's volume. A wall of puddled clay, not less than 14 inches wide, should extend from the hard pan of the meadows to the height desired, protected by an embankment wide and solid enough to resist the action of both frost and water.—This embankment, with its impervious clay wall within it, must be provided with tide-gates to let water out, but not in, and these must be muskrat proof. Ditches within the embankment convey the surface and spring water to the main drains and the outlets. These may be open or covered, according to the depth to which the water can be drawn down below the surface. If possible, they should be tile drains, laid at least below the action of frost and the reach of the plow. If the soil is of a black mucky character, containing little inorganic matter, a liberal dressing, say 30 to 50 loads to the acre, of the surface soil of the neighboring upland is all that is required to prepare it for timothy and clover. Thirty to fifty bushels of dry slacked lime, harrowed in after plowing, will fit it for potatoes or cabbages, and 20 bushels of lime, and an equal quantity of leached ashes, will be an excellent preparation of most land of this sort for a good corn crop, which, however, may well be quickened by dropping a handful of some good fertilizer in the hill.

This is a tolerably fair showing for profit, for the crops from such land are very good, and the culture is quite easy for several years; the limings, moreover, will last for several years, and little manure will be required. But, but—there is always a *but*, and well it is if you find it out in time—there are places where the muskrats will undermine the dykes and let in the water.

"A Young Jersey Farmer" writes us in distress, endorsing our views about dykes and salt meadows, but is in despair on account of the muskrats. He suggests the availability of a thin concrete wall in the middle of the dyke. This, he says, he knows will stop them. But the question still is how deep it must needs be to prove effective, for they will burrow. He proposes that the wall should be constructed simply by filling a narrow ditch with cement concrete, and allowing it to remain where it is formed; or making long thin concrete slabs, cast in moulds and fitted close together in the trench. The suggestions strike us as eminently practical and sensible. There has been a plan proposed for dyking the extensive Newark meadows which consists in driving prepared iron plates into the swamp to the required depth, which is supposed to be economical because no digging will be necessary, nor will any moving of earth be needed, except to raise an embankment high enough to shut out the tides. This is not so thorough to appearance as the concrete wall plan; and neither plan so surely water tight as the clay wall. In these works there is nothing like thoroughness—getting well down to the hard pan, or to an impervious stratum for one thing, and using a rat proof wall for another. The value of these lands is so great, that projects of reclaiming them should readily command not only the co-operation of owners, but capital enough to secure the best skill and most thorough work.

If our readers meet with decided success, or have important facts to communicate, we hope they will tell them to one another through the *American Agriculturist*, for it is a subject which interests many thousands of its readers.

Fig. 1.—WOODEN WHEELBARROW.

About Wheelbarrows.

Our correspondent, Gilbert J. Greene, Hudson, N. Y., sends us some practical notions about wheelbarrows which, however, need a word of preface in favor of one-wheeled barrows, for which he has nothing to say. The fact is they are just as useful in their place as two wheeled ones. In "navvy" work for instance, such as grading roads, parks, etc., digging cellars, making railroads and canals, where gangs of a num-

Fig. 2.—IRON WHEELBARROW.

ber of men each go back and forth on the same track, which can ordinarily be only of the width of a single board, and where of necessity they must dump at the side, the navy-barrow is by far the most convenient form. The fact that it will only carry a small load is counter-balanced by the fact that such a load is all that can be easily moved up and down the inclines which ordinarily exist where such work is done; besides, the barrows may be filled without the laborers being obliged to shift the position of the barrow, and this expedites the work materially.

Fig. 3.—TWO-WHEELED BARROW.

The common wheelbarrow with side boards, for ordinary use about the barn and garden, has not so specific an adaptation to its uses; nevertheless, this has a great advantage over the two wheeled one in going through narrow garden walks, and in the convenience with which rails

stakes, bean-poles, and such things may be loaded upon it. Two-wheeled barrows find in Mr. Greene an able champion. He writes:

"I would contribute a small sum to erect a monument to the memory of the man who invented the wheelbarrows, but it would be on the condition that no more should be built with a single wheel; how he came to adopt the single wheel is past my comprehension, unless it be that he had but one wheel and could not get another. A two-wheeled barrow possesses so many advantages over a single wheeled one that to me it is surprising that it has not long since been adopted. 500 pounds can be carried upon a two wheeled barrow as easily as 150 can be on a single wheeled one. It is more reliable, as it is not easily upset while being loaded or in wheeling it. It is very much more easily turned round, and more easily unloaded. The wheels being on the sides, the load is balanced upon the axle, and there need be little or no weight upon the hands. There are no sideboards to take out or put on each time you unload it. The two wheels do not cut in the ground so much as one does. The body and frame being solid, and resting upon an axle, it is stronger than the other. Fig. 1 represents a wooden two-wheeled barrow of the form I prefer for ordinary use. The wheels are twenty-six inches high, with iron axle. The body is similar in shape to that of the single wheeled barrows. When constructed of iron (fig. 2) they are made of an oval or dishing form. Fig. 3 represents a two wheeled barrow in the position of being unloaded; the load being nearly balanced upon the axle, the handles are easily raised and the load dumped over the front. Such a barrow can be made so as to sell for \$12 to \$16, but would cost a man, tolerably handy with tools, a good deal less if he made it himself."

[Pretty broad wheels are advisable if heavy loads are to be wheeled over soft ground, or if neat garden walks are to be travelled over.—Ed.]

Feeding at the Stack in Winter.

We still see examples of this barbarous and unthrifty custom in our journeyings. Truth compels us to say that some of our neighbors practice it. If the country only had a society for the suppression of cruelty to brutes, as your city has, somebody would get into trouble.—What is laying a turtle on his back, or boring a hole through one of his flippers, in comparison with keeping one of the mammalia, with a nervous organization like that of man, under slow torture during the whole winter? With the best of feed at the stack, the shelterless beast shivers and pines. With corn stalks and bog hay, it loses much of the flesh laid on in summer. It takes a good part of the spring and summer, in flush feed, to make up for the loss, and the profit of the animal to the farmer is nowhere.

The animal system is only a living stove, to be kept in heat by food. The lower the temperature the more wood it takes to keep up the heat of the stove. The colder the weather the more hay and provender it takes to keep up animal heat. At least a third of the fodder consumed at the stack is required to keep up animal heat, and so is wasted. Boards in the shape of good tight stables are much cheaper than hay. Do not keep any more stock than you can

stable. Slow torture at the stack ought to be abolished by statute. The man who practices it needs an overseer to keep him out of the poor house. CONNECTICUT.

Fig. 1.—SECTION OF MANGER AND FOLLOWER.

How to Hang "Followers" in Horse Mangers.

Where there is a feeding alley, "followers," as they are usually hung, are a nuisance, in fact cannot be used. The Follower, as it is called, is a rack laid in the manger, which rests upon the fodder and prevents the horse throwing it out. Fig. 1 exhibits a section of a manger with a follower adapted to use in connection with a feeding alley. It is hung on double-jointed hinges, made of pieces of heavy plate iron, with holes punched in each end, measuring, from the edge of one hole to the center of the other, half the width of the manger-front.

Fig. 2.—FOLLOWER TURNED BACK.

The follower hanging over the front of the manger into the alley. The engraver has represented an extra bar across the top, which is unnecessary. The follower is made of $\frac{3}{4}$ -inch round iron, of a rectangular shape, to fit the manger, not reaching quite to the bottom as it hangs when the manger is empty, and having a free space of some 3 or 4 inches between the follower and the edge, and an equal space on the sides. Rather an elaborate hinge to be screwed on the front rail, is shown in fig. 2; but this is not necessary, as a much simpler contrivance, which any blacksmith will make, will answer equally well. With a follower of this kind, the hay, cut feed, or anything of that kind, may be thrown in from the feeding alley, the follower being turned over outside the manger and hanging in the alley, entirely out of the way. The use of a follower may not be apparent to farmers who have a great abundance of hay and no market for it; but in districts where hay is worth from 1 to $1\frac{1}{2}$ cents per pound, even small daily wastes will be seriously felt at the end of the season.

Fig. 3.

COMPOSTING MANURE.—Much can be done at this season to prepare manures for the field, or for spreading wherever they are wanted. With all that has been written and said upon the compost heap, few are aware of the importance of absolute fineness in fertilizing matter.

One element in the immediate effects of guano is the extreme fineness to which the particles are reduced. The success of liquid manures is

owing, in part, to the same cause. The finer we can make our fertilizers the better for immediate results. In the compost heap at this season, there are three agencies at work to reduce the coarser particles of the manure, viz.: manipulation, fermentation, and frost. After the heap is formed in the usual manner with alternate layers of fresh manure and other material, and gone through with the first fermentation, it should be carefully forked or shoveled over, changing the whole mass, from top to bottom, and breaking all the lumps. The more thoroughly this is done the better. A new fermentation takes place inside, while the surface freezes and thaws with the changes of the weather. Labor upon the compost heap now will tell upon the growing crops next summer.

Barn Doors, Fastenings, Etc.

The discussion of any subject in the columns of the *Agriculturist* has the effect to set people thinking, and as a result we gather a crop of suggestions and new ideas which are often very valuable. We discussed barn-door fastenings not long since, and after the first publication had numerous suggestions, of which our readers had the benefit. Next to loose floors and springy cellars—swinging great doors are the greatest nuisance that a man can encumber his barn with. They are not only unwieldy, ever slamming and

getting out of order, hard to fasten open, or shut, but really dangerous to life and limb to both men and animals. Sliding doors are the only suitable ones for outside barn-doors, large or small, and they are so easily hung and kept in repair, if well made, that, in point of economy simply, they are superior. Besides, they may be opened wide enough for a cat to enter, or to give a little change of air, or as easily, opened wide enough for a horse or for a load of hay. No wind moves them; there is no sagging, and no trouble from snow-drifts outside, or from snow and rain blowing in over the top. These doors are hung by cast iron "hangers,"—grooved wheels bolted fast to the top of the door. These run upon an iron rod, well supported upon a bar or rail, crossing over the doorway, and extending to a distance beyond equal to the width of the door. This is protected by a little roof-like door-cap which, however, need not extend much beyond the width of the door. These doors may indeed be constructed and braced in the usual way, but are best made of two thicknesses of well-seasoned $\frac{3}{4}$ -in., clear, matched stuff. On the inside, boards of any convenient

Fig. 1.—LATCH.

width may be used, and should be horizontal. The outside should be of boards only 4 or 5 inches wide, and put on at an angle of 45°. To give additional strength, a board 10 or 12 inches wide may be put across the top, outside, and 8-inch battens across the bottom and sides.

Fig. 2.—LATCH.

It is a matter of considerable interest to know how to fasten these doors securely and easily. They are usually fastened on the inside with a hasp and pin, or with a hook; if these are not securely pinned they can be opened with a knife from the outside, and simple inspection does not tell whether they are secure or not. Dr. Hexamer, of Westchester Co., many of whose contrivances for saving steps and labor about the barn are very good, uses latches on the following plan. Figure 1 shows the latch of a double barn-door, which is simply a flat hook and staple with a pendant piece of iron, of the shape shown, above the staple, and so hung that when the hook is in it must be fastened. It is easily seen from the inside whether it is so or not, and an attempt to open the door from the outside will also reveal the fact.

Figure 2 is a self-fastening latch for a single sliding door. The catch is in a gain in the inside of the post against which the door shuts, and the latch may be in a similar gain, or in a mortice in the door. This arrangement may sometimes be conveniently reversed by putting the latch in a mortice in the door post, in which case there should be a strong outside batten projecting as far as the latch does, to guard animals and men from harm from it, as well as to protect it from injury.

One door of every barn should lock from the outside. This will seem folly to many people, but we know that many barns are burnt by the pipe-fire of wandering "tramps," who always sleep in unlocked barns if they can, and that harness and other things are stolen in all parts of the country, more or less. It is usually best to lock one of the small doors, which should be hung on the inside, and locked with a strong hasp and good padlock, chained to the door.

Tim. Bunker on the Food Question.

"I knew we should catch it to-day," said Seth Twiggs, as he came into our house on the evening of Thanksgiving day, and seating himself comfortably upon the settle, blew a ring of smoke out of his month, as if it had been shot out of a rifle. "The Parson generally hits the nail on the head, and hit it square to-day, no mistake. We have sent off too many of our boys to the city. There isn't so much breadstuff raised in Hookertown as there was fifty years ago, and if it keeps on at this rate, somebody has got to starve by and bye."

"That is to say, if every place is just like Hookertown," I responded.

Neighbor Twiggs' remark had reference to Mr. Spooner's Thanksgiving sermon, which was pretty much like all his sermons, whether on Sundays or not, "a word in season." You see, Mr. Spooner, like myself, belongs to the old school of folks, who have got so accustomed to making up our own minds on public questions, that we can't afford to take our opinions second hand. You see, most people around here in Connecticut have got a dreadful hankering after city life and fashions. They want something better than farming for their sons and daughters, though, according to my notion, farming, taking the long run, pays better than any other calling upon the face of the earth. The boys that grow up around here are smart, and would probably do well at almost any thing, if they had a fair chance. But Hookertown can't hold 'em any more than a pot can hold boiling water. Some of them have gone down South to try their fortunes, some to the West, but more to the City, which threatens to swallow up the coun-

try, which is a good deal like a man swallowing his own stomach. You see this state of things makes rather a dull look for the old parish, and worries the minister, and it works out in his sermons on Thanksgivings, and Fasts, and sometimes on Sundays. Some grumble about political preaching, and secular preaching, etc., but for my part, if a man has got any thing to say to make folks better, I never could see why it wan't jest as well to say it on Sunday as any other time. But the grumbling don't trouble Mr. Spooner much. He is independent as a wood-chopper, and knows he can get his bread and take care of himself, if the Hookertown people turn him out of the pulpit to-morrow, which they have no notion of doing. He speaks right square out, and nobody has any more doubt as to which side of a question he is on, than they have about sunrise.

Well, you see this food question is what the philosophers call a poser. If bread and meat are all the while getting dearer, and labor is growing cheaper, and that is the settled tendency of society, you see the time is coming when labor won't buy bread, and somebody must perish. That is the way things are working now, and wise men should be looking for a remedy.

Mr. Spooner showed this very clearly. It has been the tendency in Europe for a great many years—England hasn't raised her own breadstuffs for more than 30 years. The great mass of her people are gathered in cities, and large manufacturing towns, and there is not land enough left to raise a full supply of food for her population, even with their improved husbandry. She has to bring large quantities of wheat and other grains from the ports of the Mediterranean, and from across the Atlantic, to make up the deficiency. Now, if there should be short crops in these countries and in America, or if she should be at war with enemies strong enough to blockade her ports, nothing could prevent great distress and starvation.

The same social disease is beginning to work in this country. The price of food has more than doubled within a very few years, not only in cities but in the farming districts. Flour in Hookertown has been selling this fall at \$15 a barrel; butter at 45 cents, and beefsteak at 30 cents per lb., and these things are just about a fair sample of everything else. Eight years ago these things could have been bought for less than half the money. This shows that mouths have multiplied faster than food. There are more consumers than producers. Farm labor in the same time has increased in value, but it has not kept pace with the increased price of food. Wheat has gone up from \$1 to \$2.50 a bushel—labor from five Yankee shillings to nine, which is an increase of more than one-half, and the labor is not near so good. The native born hired man of a generation ago, who worked for \$12 a month and board, the year round, has pretty much disappeared, and we have in his stead the unskilled immigrant. This shows that labor is not comparatively as well rewarded. His day's work will not buy him as many comforts as it did 20 years ago. This shows that something is "rotten in Denmark," for the condition of the laboring class, and not that of the rich, is the measure of the prosperity of a country. It is a bad state of society where only a few are growing rich, and the many are just getting a living or suffering for the comforts of life.

Then, Mr. Spooner said, the Societies in the cities for the aid of children, were another indication of the same evil. Thousands are left every year in circumstances of extreme want, and there is no efficient remedy for their case

but to find homes for them in the country, where they can help themselves. Thousands are sent off every year through these Societies, and a little is thus done to restore the disturbed balance of society.

The pith of the discourse was, that Hookertown was the center of the Universe, that farming was the best business, that those who were engaged in it should be content with such things as they had, and be thankful for them. He had some sly thrusts at clam-shell bonnets, silks, satins, and ribbons, fast men, and fast women, and the general extravagance of the times. These I suppose, were meant as sauce for the Thanksgiving turkey, and to help digestion.

"Well, Squire, what are you gwine to do about it. Food is getting higher every year, and labor don't keep up with it. The rich are growing richer, and the poor poorer. What are you gwine to do about it?" asked Seth Twiggs, as he knocked out the ashes of his third pipe and loaded again.

"Well," said I, "I am not going to whine about it. Of all remedies for a great public evil that of whining is the poorest. I have faith to believe that there is some way of deliverance from this and all other social evils. The high price of food is not going to last forever among this great people, with territory enough to raise breadstuffs for the world, were it only half tilled.

"All that Mr. Spooner says is as true as preaching. Things are a little unsettled just now, but they will come right after awhile. I have noticed that there is a tendency in Christian society to correct its own evils. Sometimes we have an outbreak of burglaries, bank robberies, and shop-lifting, and it seems as if society was going to ruin. But when the people get waked up, and a few of the thieves are convicted and sent to State's Prison, the times improve wonderfully. People are not going to live in miserable tenement houses, and suffer all the miseries of city poverty without learning something. Native born Americans certainly are not. I have noticed that many go to the city, do not succeed there, and come back again wiser, if not better men. They find that their genius does not lie in the direction of trade, but they have a decided tact for making corn and potatoes grow. They support their families comfortably, and on the whole, are no worse for their city experience. Then I have noticed again, that a good many who succeed in the city, acquire a competence, and before they are spoiled, retire to the country to lead an industrious rural life. They become large producers of breadstuffs, and supply the city markets with fat cattle, sheep and swine. They rejoice in their well tilled farms, and in their flocks and herds. Then again, I have noticed that some of our very best small farmers and gardeners are city bred people, tradesmen, or mechanics, who from failure of health or disgust with the city, come into the country, near good markets, to support their families from the soil. They have thrifty habits, some capital, and succeed admirably by making the most of a little land. Thousands in these ways are changed from consumers into producers, every year. If multitudes flock to the city, multitudes come back to the country.

"And then there is a growing tendency among our city people to scatter themselves in the neighboring towns. A large part of the men who do business in New York, live out from five to fifty miles in the country. Some have small homesteads, but they are all to some extent cultivators, and draw a part of their support from the soil. And this tendency is on the increase, and will grow with the increased facilities for travel that every large city is making for itself. This will not only help to unburden the city, but will add to the production of the country, and help to make food cheaper."

"I shouldn't wonder if we had New Yorkers living in Hookertown, yet," said Seth.

"Stranger things have happened," said I.

"I shall beat 'em on cabbage tho', if the smartest of 'em come," said Seth, with an extra puff.

"It takes Dutchemen for cabbage. You should not brag!" I continued.

"Then there is another thing in connection with this food question, which I have thought of a good deal. No man has begun to conceive of the great change which our improved farming tools are destined to make in the productiveness of human labor. A man is multiplied ten fold. We should have had a famine during the war, if it had not been for them, and food would have been a great deal dearer than it now is. The horse reaper and mower mean cheaper grain, and cheaper meats of every kind, that consume hay and grain. Every year is adding to these improved tools, and extending the fields of their usefulness. They come very slowly into use, but they are certainly coming; and they can not fail to do two things; to make farming pay better, and to cheapen the price of food. A vast deal of brain power is lavished upon these inventions, and it will have its reward in relieving the sweat of the brow.

"And then when steam gets into the field, as it must, upon the prairies at least, what may we not expect in the way of cheap Johnnycakes and bacon?"

"Max I be there to see," exclaimed Seth, rising to go. "That is what other folks will do about it;—but what do you mean to do about it, Squire Bunker?"

"Do?" said I. "Why, I'll stick to the old farm, set my neighbors a good example, and die in the furrow. And if that ain't enough, I'll blow my trumpet in the *Agriculturist*, and set all the people from Maine to Texas, thinking on the food question."

"Good!" said Seth, as he went out. "That paper is the best tool yet out, to make bread cheap. It believes in brain manure."

Hookertown, Conn., } Yours to command,
Dec. 8th. } TIMOTHY BUNKER, Esq.

The Best Style of Family or Dairy Cows, and How Obtained.

We have before us an article from a gentleman who has a rather large herd of milch cows, the surplus of which he advertises and puts upon the market and finds ready sale for at remunerative prices. It is natural that he should advocate such cows as he breeds, or at least breed such as he advocates, if he is a fair-minded man, and such we know him to be. The subject he proposes cannot but be discussed with profit, and we hope those who may disagree with him will respond. He writes:

"The subject that probably interests more of the readers of the *Agriculturist* than almost any other is, 'What is the most desirable kind of cows for family use or dairy purposes? In other words, what breed will produce the most value in milk, butter, and cheese, on a given amount of feed?' I will give you my experience for what it is worth. I have tried nearly all the various breeds, Alderneys, Ayrshires, Short Horns, Madagascars and natives, and I became satisfied, some six years ago, that 'Alderneys' gave the richest milk and produced the best butter, but thought 'thorough breds' too delicate

in constitution for the general use of farmers. I then commenced crossing the "Alderneys" with all these breeds, and after careful observation I am convinced that Alderneys crossed with Ayrshires produce the best and most desirable cow to be had for all purposes. The Ayrshires are of good size, extremely hardy, and good milkers, but the quality of milk is no better than the Devons, natives, etc.; but cross the Alderneys with them and you get a hardy animal, with the rich milking quality of the Alderney. You increase the size over the thorough-bred Alderney. Half Alderney and half Ayrshire is, I think, the very best cow extant. I have now in my herd several heifers of this cross, three years old last spring, that the past season gave 12 to 14 quarts milk per day each, and made 12 pounds of splendid butter per week on good pasture. If the farmers in the dairy sections of our country would try the crossing of their present breeds of cows with thorough-bred Alderney bulls, they would greatly improve their stock, increase both the quantity and quality of their butter, and benefit the millions of consumers of these articles of necessity and luxury in every family. T. F.

Night Soil as a Manure.

The use of night soil as a fertilizer has frequently been advocated in these columns, and we have endeavored to show how a generally wasted article might be turned to account. Recently we have had sent to us, by several correspondents, an article that originally appeared in the *Springfield Republican*, which we quote:

"Very severe prohibitions have been issued in France, England and Germany, against the use of poudrette, imperfectly prepared, it having been proven by careful experiments that the fecal matter of sinks cannot be converted with safety into garden manure under five years' careful preparation. Pesticidal and other diseases are propagated by vegetables grown in soil thus manured. Yet, it is stated that these death-dispensing deposits are absolutely used in the market gardens around our large American cities in their natural state, and many of the fruits and vegetables so grown can be told by the nostrils or the taste before they are cooked, and in the process of cooking. It is the opinion of skillful medical observers, that nearly all the novel diseases which now afflict many American cities, owe their origin to the organic diseased matter taken up by vegetables and fruits grown in soil dressed by the fecal matter of the sinks, and transferred to the stomach. Galloping consumption in persons whose families have never been subject to this terrible disease have been traced to the use of vegetables grown by poudrette."

These are serious charges, which if true would warrant the denunciation contained in the article, and our readers need not be told that if there were the least foundation for such an alarming report we should not only not advocate the use of night soil, but be among the first to condemn it. Let us look a little at the alleged facts in the above statement. Are there any "prohibitions" in France, England and Germany? As to the last named country, we cannot speak so positively, but in England, the use of city sewage has been attended with such profitable results, that one of the important problems of the day is, to increase its employment, and prevent a fearful waste. In olden times, 1789, there was a prohibition in France, but the restriction was long ago removed, and we are quite certain that it has not been renewed, as the most recent French work on gardening, only a few weeks old, speaks of the use of night soil. The work of M. Gressent, 1865, gives plans of some of the celebrated market gardens, in which are tanks

for holding liquid manure, made from this "death dispensing deposit." Joigneux, in the most recent and most elaborate work on gardening yet published in France, says that the exclusive use of fecal matters may give a bad flavor to vegetables, but advises their use when composted with other matters. It is very probable that a plant, especially an edible root, if grown in ground containing a large quantity of recent night soil, would have an unpleasant flavor. Yet we have eaten vegetables from a garden where this manure was used exclusively for a series of years, and though our prejudices kept us on the lookout for something unpleasant in their flavor, we failed to detect it.

In China and Japan their success in gardening—for their agriculture is almost all gardening—has for centuries depended upon the use of this manure, as they have scarcely any other.

As to the medical view of the case, no names being given to the "medical observers" we attach no weight to their "opinion." As far as negative testimony to this point goes, we have consulted with two of the most eminent physicians—men who are known everywhere as among the first in their profession—and they have never heard of, or read of, any disease being attributed to the use of vegetables treated with this manure.

In all cases we have advised the composting and deodorizing of the night soil, and we believe that when prepared thus, it may be used with as much safety as any other fertilizer. We regret that a paper so generally correct as the *Springfield Republican* should have given what seems to us an unfounded and needless alarm.

SENSE AT THE "FARMERS' CLUB."—Doubtless many who read the reports of the so-called Farmers' Club, really believe that a meeting of farmers assemblies in New York to discuss farming matters. It is simply a miscellaneous gathering, including persons, who, by carrying on business in the city, are enabled to keep up a farm in the suburbs; doctors whose practice does not seem to occupy all their time; men who have given up farming to earn a living by their wits, and everlasting talkers, who are always delighted with the sound of their own voices. These people get together and discuss, with equal gravity, the influence of the moon, or the last invention in the way of bitters. The reports of what they do are about the funniest reading extant, and were it not for their comical character, it would be a great waste of paper on the part of the *Tribune* to publish them. These reports, however, have some good things put in by the reporter, or from his correspondence; these save the whole thing from being utterly ridiculous. Of late, the Club, having exhausted agriculture, have turned their attention to medicine—and as the talkers there seem to know as much about one subject as they do about another, they discoursed about curing fever and ague as glibly as they would the sticking of pigs. There is no knowing but the Club would have exhausted medicine and tried its facile hand at theology, had not a live farmer happened in, who entertained the singular notion that a Farmers' Club was for the purpose of discussing farming. We read in the report: "Dr. Hexamer inveighed at some length against the discussion of medical questions by a Farmers' Club." Keep on, Doctor, with your "inveighing;" you used to be a good practitioner before you turned farmer, and if you will only cure the Farmers' Club of *cacoethes loquendi*, we shall believe that your skill is equal to the most desperate cases,

How New York is Supplied with Flowers.

In a large city the sale of cut flowers, in the form of bouquets, baskets, table decorations, and the like, in the aggregate amounts to a very large sum. Every wedding, party, or similar occasion makes a great demand for flowers, and during the holidays all the sources of supply are taxed to their utmost. It would not be extravagant to estimate the expenditure for flowers in New York City on New Year's day at from thirty thousand to forty thousand Dollars. The little bunch of violets offered on the streets, by the flower girls, for a dime, as well as the choice bouquet furnished at the florists' stores for \$20 and upwards, all require flowers, and for a good part of the year flowers that are grown under glass. In all sorts of odd and out of the way places we find small greenhouses, in which these are produced. The neighborhood of Hoboken, N. J., is especially noted for the quantity of flowers produced by the German growers. These are frequently mechanics, shoemakers, tailors, etc., who have small glass structures, and generally grow but one or a few kinds of flowers. One will grow violets, another carnations, another heliotropes, and so on. By giving attention to only one or two varieties, these humble cultivators often attain greater perfection in their products than do larger establishments where there are many varieties. The flowers are gathered from these places by middlemen, who bring them to New York for sale to the bouquet makers. These flowers are cut with great care, and the buyer gets flowers only, without any extra buds, and seldom any stem. Indeed, the bouquet maker can furnish a better stem, for his purposes, from a bit of broom corn or a sliver of wood, than the one naturally belonging to the flower. The green-houses referred to are, however, small affairs when compared with the large establishments, in which sufficient capital allows the erection of the best houses and the use of all the modern appliances.

One of the most extensive florists' establishments in the vicinity of New York, is that of John Henderson & Co., Flushing, L. I., where the production of cut flowers is made the leading business. The range of glass is extensive, there being twelve houses, each 100 feet long, built on the low roofed plan, described in Oct., 1865; these houses are all side by side, on what is called the ridge and furrow system. Besides houses there is about as much area occupied by buildings of other styles. The camellia house is very spacious, and the camellias are planted out in the open ground of the house. Each of the twelve buildings above referred to is generally occupied by one kind of plant. To look through a house a hundred feet long, entirely filled with Carnations, Bouvardias, or other plants, has a singular effect. Those who pet a single plant with great care will experience no great amount of pleasure at seeing things they have learned to regard as individuals, massed into such crowds, and with no more personal identity than a soldier in an army. In looking through such an establishment, one almost gets tired of flowers. A sheet of scarlet is seen in one house, a broad bed of white in another, lavender color in another, and one goes away with his senses of sight and smell so overwhelmed by quantity that he has lost all idea of quality. It is only when the individual flowers get out of the crowded green-houses, and passing through the hands of the expert bouquet-maker are worked up into beautiful combinations, that they again seem to us objects of beauty, and not stock in trade.

[COPYRIGHT SECURED.]

HEAD OF A CALF.—PAINTED BY ROSA BONHEUR.—Engraved for the American Agriculturist.

We have had the pleasure repeatedly of presenting our readers with engravings of animals from the chaste pencil of that really wonderful woman, Rosa Bonheur, whose success as an animal painter is so remarkable. This is due altogether to her faithful study of nature, and great familiarity with the animals which she paints. Her studio is said to be located almost in the very midst of her animals, a number of which she maintains in luxurious idleness for the purpose of getting "studies" of them in all their different attitudes and positions. There is something so young and green, and playful and "butty" in that calf's head, that we enjoy looking at it, now, as much as we did when we first saw the picture, although there is something painful to be obliged to repress the desire to rub the fellow behind the horns and scratch its soft ears. Mademoiselle Rosa's history is somewhat remarkable, showing that distinction comes almost surely from faithfully following out natural inclinations. Her father was a painter, Rosa was a poor scholar and very sensitive, and so was taken from school and allowed to draw and

paint. She was so fond of animals that she could not be prevented attending markets and fairs, and making her studies at butchers' stalls, and most likely at the abbatoirs, too. So soon she became distinguished for her freedom from conventionality—or imitation of other artists—and for her bold, life-like delineations of animals.

We need in this country artists of high character and integrity, who shall give to the study of our domestic animals the same careful labor. Several who might distinguish themselves with comparatively little trouble, are so taken up with painting scenes from the war, or with other subjects for which there is great demand, that cattle and sheep are neglected; or if studied, the lean kine and the dung-smeared, the scabby, tag-rag sheep at the end of a hard winter, and starey, half starved calves are taken as fit models. Pictures of such will sell to city gentlemen of fortune, who hardly know how an animal should look, or who remember the cattle on the run-down farm of their boyhood, which they left in disgust at 16; but they will not be bought by anybody in whose breast emotions of pity and indigna-

tion are excited at the sight, and they will spoil the sale, to such people, of the fine pictures in which they are introduced. We need true artists who will study well the points of fine animals, and portray them. The great beauty of well bred stock with requisite skill can be placed upon the canvas and upon the engraver's block.

Violets New and Old.

A bunch of Violets on Christmas day! how beautiful they are, and then, how they fill the room with an odor, more grateful than any incense that will be burned in celebrating the holiday. What a pity it seems, that our native violets—or at least the showy ones—have no odor. For the violet of poetry we have to go across the water, and right beautiful things do we receive. The name given to the European species, *Viola odorata*, is strikingly appropriate, for no flower excels it in the abundance, and at the same time the delicacy, of its perfume. A single little flower will manifest its presence to the senses, while a handful of them do not give

off a fragrance strong enough to be oppressive. The original single species has been greatly improved upon, and we have now plants that bloom more abundantly, and that give flowers of different shades, down to white, and even double ones, some of which are very large. One of the best of the older varieties is the Neapolitan, double, of a pure violet color, a free bloomer and very fragrant. A quite recent variety is *La Reine des Violettes*—or Queen of Violets—a very large flower, as double as a rose, and looking as unlike a violet as need be. As we have seen it, it does not appear to be a very free bloomer. The English florists announce three or four other new varieties not yet tested in this country.

The Russian Violet belongs to another species, and has already given some well marked varieties, one of the latest of which is called the Czar. Mr. George Sneh, of South Amboy, N. J., sent us materials for the accompanying illustration, and the following notes upon the variety

"This fine flower was obtained from seed by Mr. Graham, of Crawford, in England. It is an improvement on the old Russian Violet, the flowers being very large and sweet, of a fine deep blue." The plant is remarkable for extreme luxuriance of growth; some plants in pots having produced more than one hundred and thirty flowers to a root, many of the blooms measuring an inch and a quarter in depth.

"A writer in the *London Cottage Gardener*, says: 'I have now (Nov. 3d), some splendid plants with full-blown flowers, which from their wonderful size and sweetness, cannot be surpassed; nor, indeed, can any violet come near the Czar.' Another, under the heading of 'New things I have tried,' says, 'the Czar Violet has proved not only hardy, but very prolific. Its flowers are not only larger than the older kinds, but are decidedly superior in fragrance.' Mr. Graham, the raiser, says, 'the Czar Violet is now in bloom (October 1st), and will continue so through the winter, even during frost and under snow, until May.'

"*Viola cornuta*, which is now much used in England as a bedding plant, is not a novelty, having been introduced from Spain in 1776. It was figured in the *Botanical Magazine*; but with this exception, has remained for ninety years almost unnoticed. The flowers are slightly fragrant, of a delicate slate-blue, a color very useful for toning down, and rendering more effective the brilliant and glowing colors.

"In England, *Viola cornuta* is 'extremely hardy,' thriving without care in any common garden soil, and flowering abundantly throughout the summer. On light and dry soils, however, the flowers are not so large as those from plants on heavier and moister ground. There are three or four varieties of this violet, the true one being of better habit of growth and more free flowering than the others."

Violets when grown in the garden do much better in a partially shaded place. They may be had almost any time in the winter if one has a frame and a few sashes, as it takes only a slight heat, that of the sun, to start them into flower. The plants are set in the frame in good soil, in August or September, and when cool weather comes on they are covered at night. By a proper management of the sashes, flowers

NEW RUSSIAN VIOLET—THE CZAR.

may be had until early winter. For later flowers, the plants are covered with leaves, which, by excluding the light keep them dormant. When wanted to bloom, the leaves are removed and a few days of sun will bring them out.

Propagating the Blackberry.

BY A. S. FULLER.

The most common method of propagating the blackberry is by cuttings of the roots, which may be made in the fall or early in spring—the former being preferable.

Take up the roots when the plants have ceased growing, and cut them into pieces of from one to three inches in length. Then prepare some boxes, by boring holes, in the bottom to

Fig. 1.—BURYING CUTTINGS.

insure a good drainage, and place a layer of straw over the holes to prevent the soil from falling through; over this put a layer of roots, then another layer of soil, and so on alternately until the box is full.

Bury the boxes containing the roots, on a dry knoll or slight elevation in the garden, bank them up with soil, and cover so deeply that the roots will not be frozen. In addition to this, it is well to cover the whole with boards to carry off the water, and if the soil is naturally tenacious and wet, a small excavation should be made

at a point that will be under the center of the box when put in place, as shown in figure 1.

This arrangement will allow any surplus moisture which may accumulate in the boxes to drain off. Early in spring, so soon as the weather and soil will permit, take out the roots and plant them in good rich soil, placing the pieces about three or four inches apart, in drills, and covering them two to four inches deep, accord-

ing to the nature of the soil. If it is a heavy one, two inches will be sufficient. When the plants are to be cultivated with the plow or cultivator, the drills should be three feet apart; but the best method is to place them not more than eighteen inches or two feet apart, and cultivate entirely with the hoe or fork. In a naturally dry and porous soil, it is a good plan to cover the entire surface, at the time of planting, with a liberal dressing of some coarse material as a mulch. This will ensure a supply of moisture, and often save a large portion of the cuttings, if not the entire stock. Cuttings made in the fall and placed where they will not freeze during winter, have an advantage over those made in the spring, from the

fact that the peculiar process which always precedes the formation of roots, called the *callus*, has sufficient time for full development before actual root growth commences. The new roots are usually emitted from the ends of the cuttings where the callus appears. The callus is always produced first, roots succeed it, but what relation the callus bears to the root is not fully known; it appears to hold the same relation to it that the cotyledons of some seeds do to the germ, *i. e.* it supplies the roots with necessary food until they are sufficiently advanced and able to extract it from the soil themselves.

The buds from which the stems are produced are distinctly adventitious, that is they do not arise from any previously formed or latent bud, but are developed from the matter between the bark and wood. From this point the bud originates; first, by a very minute aggregation of cells, which assumes a conical shape, pressing outward through the bark and up to the surface, where the leaves are spread out to the light and air. Sometimes several buds will be produced on a very small piece of root; but when this occurs all will be comparatively feeble if they continue to grow. In a majority of such cases the strongest of them will take the lead and the others fail.

Figure 2 shows a piece of root with two shoots, one of which has reached the surface, and the leaves expanding. Plants grown in this manner are much better than those produced in the natural manner from suckers, because they are more abundantly supplied with fibrous roots. Root cuttings of from one to three inches in length, planted in good soil, will make plants one to three feet high the first season. Plants may also be taken up, and the roots made into

cuttings, in the spring, and planted in the same manner as described for those made in the fall.

When the variety is very scarce, then any small roots may be used for propagating, but in such cases it is best not to attempt it in the open ground, but place them in a propagating house. Cut the roots into pieces of from one-half to one inch long, mix with sand, and place in a warm situation, but

not in so high a temperature as to force the formation of buds. When the callus is formed, and buds begin to show themselves upon the surface, which they should do in four to six weeks, place them in soil composed of equal parts of leafmold and sand, and in a position where they will receive

a heat of seventy-five to ninety degrees.

When the plants have made a growth of four to six inches, they may be potted singly, or planted out into the open ground, provided the weather is warm and there is no danger of their becoming checked by cold. The blackberry may also be propagated from green wood in summer, in the propagating-house, or early in Spring by cuttings from plants forced for the purpose.

The same process used by propagators in multiplying grapes and other plants from green wood is equally applicable to the blackberry.

Single bud cuttings may be made of the mature wood in the fall, always choosing the medium sized branches, and those that have not become very hard; or in other words, not fully ripe. Plant in boxes or pots, and place in a temperature of from 80 to 100 degrees. This is not quite so certain a method as the others, still, with some varieties, very good plants can be produced by an experienced propagator.

Layering the branches in summer is often practiced with success, especially with some varieties. In making layers, that portion to be covered should be stripped of its leaves, and then a small incision made on the branch, and on the under side, as is usually done when layering woody plants. Root cuttings, however, produce the very best plants, and the number that can be made from the roots of one large stool, if given proper care, is much greater than one would suppose who has never tried it.

DANA'S HOVEY PEAR.—The London Gardener's Chronicle gives a description and (very poor) figure of this American variety, and says: "Its flesh is melting and juicy, its flavor more delicious than that of any pear known, being that of the Winter Nelis, with a slight smack of the Seckel; its season is December until January. When this pretty and delicious pear becomes known, a dish of them at dessert will be as much sought after as a dish of old Golden Pippins in the last Century."

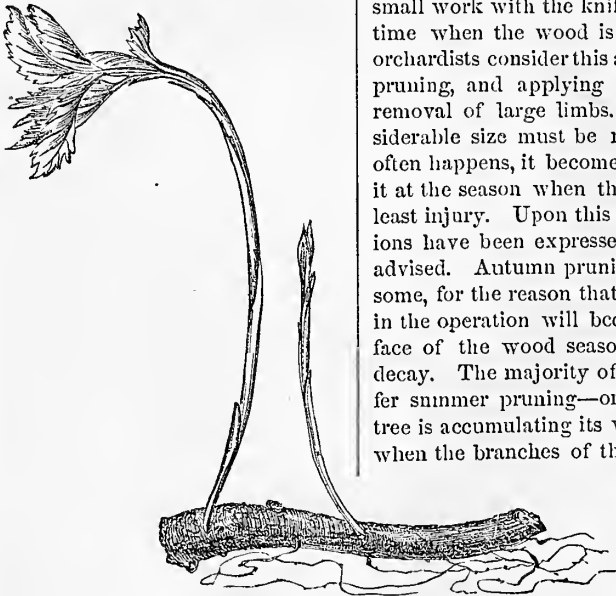

Fig. 2.—BLACKBERRY SHOOT.

Ways and Means in Pruning.

Notwithstanding the fact that in our notes for the month there is always a timely word upon all the important operations in the orchard, we have many letters asking about pruning, especially as to the time at which it is to be done. It has frequently been stated here that the small work with the knife may be done at any time when the wood is not frozen; but most orchardists consider this as trimming rather than pruning, and applying the latter term to the removal of large limbs. When limbs of considerable size must be removed, and this too often happens, it becomes of importance to do it at the season when the tree will sustain the least injury. Upon this point a variety of opinions have been expressed and different seasons advised. Autumn pruning is recommended by some, for the reason that the wounds thus made in the operation will become dry and the surface of the wood seasoned and secured from decay. The majority of good orchardists prefer summer pruning—or that done when the tree is accumulating its woody deposit. This is

when the branches of the year have ceased to elongate, and the forces of growth are directed to preparing for the vegetation of another year. At this time the process of healing goes on more rapidly than at any other, but it has the disadvantage of being a season when there is so much other work to be done that the labor cannot be given to the orchard. Another, but a minor disadvantage is, that the trees being covered with foliage the effect of the removal is not so readily observed. The season in which there is most leisure, and perhaps the next best to the one last mentioned, is after the severity of winter is over, but before the swelling of the buds indicates the awakening of vegetation. Though late winter is not the best season, it is preferable to do the work then than to neglect it altogether. As soon as the tree starts into growth no wound should be made, as there will be a disagreeable and injurious out-pouring of sap.

As to the operation itself, it should be done with judgment and care. Cutting away a limb without a clear idea of the object to be gained—going into a tree with an axe and chopping here and there, is not pruning, but butchery. Having determined upon the removal of a limb, it should be sawed off neatly, close to the main branch. It is not rare to see a butt of a foot or more in length left by the pruner; this is a most mischievous practice, as a crowd of small branches will usually spring from the base of this stump, as shown in the engraving, while the upper end, having no supply of sap, will decay. Works upon orchard culture generally recommend that the wound be made no larger than the base of the limb removed. In France, where tree culture is made a profession, the most recent writers advocate pruning close to the trunk, and covering the wound with some preparation.

In France coal-tar is used on all trees except stone-fruits—but while we mention this as a matter of interest, we do not advise its use. It

BAD PRUNING.

may be that our coal-tar is different from theirs—at all events so much injury has been done to plants in this country by the various products of coal and petroleum that we advise great caution in their use. Grafting wax, made warm enough to apply with a brush is cheap, safe, and efficacious, as is the shellac and alcohol paint, but the materials for this are now very expensive.

The rough surface left by the saw should be smoothed with a knife or drawing knife before using the wax. Limbs of considerable size may be neatly removed by means of a large, stout, and sharp chisel, driven from below by a wooden mallet.

The Care of Young Trees.

There would be much less said about pruning and much less pruning to be done, were it generally known—and the knowledge acted upon—that we have it in our power to form the tree while young, and so regulate the young growth that the removal of large limbs would be a rare necessity. The too common method is, to trim the trees up, to a small head, at planting, and then let them grow until they come into fruit, when it is discovered that pruning is needed, and there is a great lopping off of useless limbs, that with proper treatment would never have grown. Those who will have their trees trimmed high, doubtless have good reasons for the practice, but the best experience teaches that low headed trees are, other things being equal, more exempt from those troubles dependent upon climatic influences, than those trained to a tall naked trunk. Our present object is not to discuss the general subject of pruning young trees, but to point out a trouble that often arises from allowing them to have their own way. We refer to the formation of crotches, or a division of the trunk into two nearly equal branches, which may again subdivide in a similar manner, and thus render the tree liable to split. In forming the young tree in the nursery this is avoided by all intelligent growers; but all trees are not treated as they should

be, even in the nursery, and we often see young orchards containing examples of very bad management. When a crotched tree of this kind is discovered, it is best to remedy the defect even at the considerable sacrifice of one-half of the present growth. The manner of treatment is to cut away one of the branches that form the fork, retaining the one that can be most readily brought to the upright position; in removing the limb, enough of its base is left to afford a support to which the remaining one may be secured, and this is then brought as nearly erect as possible and tied to the butt, as in the engraving. When the erect position has become established, the supporting portion is cut away even with the trunk; if this be done at the usual season of pruning, the wound will soon heal over.

EARLY MAY AND EARLY RICHMOND CHERRY.

—This popular and early market cherry has also been called Kentish. It seems to be established that it is a Virginia seedling, long known in the State where it originated, as the Early May. The elder Prince procured the variety from Richmond, Va., and called it the "Richmond." The Illinois State Hort'l Society, at its recent meeting, voted to adopt the name Early May.

Profits from Small Places.

In January, we alluded to some of the methods by which, in thickly peopled districts, and in towns and villages, small tracts of land might be rendered profitable. The raising for sale of such plants as are usually transplanted, was hinted at as a considerable source of profit. Tomatoes, egg plants, peppers, early cabbages, cauliflowers, cucumbers and melons, will usually meet with a ready sale, if produced under glass a little earlier than they can be raised in the open ground; while late cabbages, celery, asparagus roots, etc., may be raised without the use of glass. Let one make a business of supplying good plants and he will soon find that the majority of his neighbors will prefer to buy plants to raising them. Then, there are always a certain number of people who forgot to sow at the proper time, or who had "bad luck" with their seeds, who would be glad to make up for their neglect by purchase. The earliest plants are raised in hot-beds, but these are not absolutely necessary, as cold frames are more easily managed, and will bring forward many things sufficiently early. For hot-beds or cold frames, sashes will be required in number according to the extent of the operations. The usual size is 3 x 6 feet, but any other size may be made to answer. Beginners had better try a *mild* hot-bed, with a gentle heat to start the seeds. Choose a sheltered place, facing the south, fix on the size of the bed for the number of sashes to be used, and make an excavation about two feet deep. Then drive down stakes and board up the sides of the pit, allowing the boards at the front to come 12 inches above the surface, while those at the rear are 18 inches above. Put cross-pieces 3 inches wide from front to rear, as far apart as the sashes require; in the center of each cross-piece, nail a strip an inch square, running the whole length; this will serve as a guide for the sash to run against. Fill the trench with fermenting manure that has previously been turned over several times, throwing it in gradually and beating it down firmly with the fork; cover it with 6 inches of good light soil, and put on the sashes. The bed will soon become very hot, and when the thermometer shows that the heat is declining below 100°, the seeds may be sown. Plants from warm countries, such as tomatoes, egg plants and peppers, need the hot-bed more than do cabbages, etc. The plants, as soon as up, require air during the middle of the day, and to be covered at night. Cold frames are far preferable for those who have had no experience with plants under glass. A frame like the above is used, but no excavation is needed. It is put over well prepared, light, rich soil, and the sashes kept on during the day; shutters or mats are put over them at night, and when the soil, from receiving heat by day and being prevented from giving it off at night, has become well warmed, the seeds may be sown. After the plants are up, the beds will need daily care. Give air, by tilting the sash, or removing it altogether, according to the weather. Close the sash early in the afternoon, before the soil begins to cool, and cover the glass at night to retain the heat. Plants in frames will need thinning, weeding and watering. Watering should not be done with cold

water, but it should always be brought to the temperature of the earth in the frames. Where means will allow, it is better to have extra frames into which the plants may be transplanted when large enough, in order to give them room. Tomatoes in particular, are benefited by this treatment. Whenever the weather will allow, keep the glass off altogether, except at night. Cucumbers and melons may be planted

BEURRE CLAIRGEAU.

on inverted sods cut into pieces 3 inches square, and the plants be raised to a size that will render them safe from the attacks of insects when they are put out. By the use of cold frames, plants may be had ready for sale two or three weeks earlier than if the seeds were sown in the open ground. The chief precautions are, to avoid burning the plants by keeping the sashes closed during the day, and to avoid chilling them by delaying the covering too late at night. The end of February is quite early enough to make hot-beds in the latitude of New York, and cold frames may be started in March. There are other things that may be profitably raised by the occupants of village and town lots that will be noticed another month.

A Noble Pear—The Beurre Clairgeau.

In a note on pears in January, it was remarked that the most popular fruits were not those that had the highest rank with the pomologist. The Beurre Clairgeau is one of those pears that, without ranking as "*best*," has so many good qualities that when it becomes better known, it will doubtless hold a high place in popular estimation. Like many other valuable fruits, this was a chance seedling, found at Nantes,

France, about 1839, by Pierre Clairgeau, a gardener, by whose name the fruit is now known.

The tree is a handsome one, a good grower, and a remarkably abundant bearer. It does not grow well upon Quince Stock, though there are reports of its success when double worked. The fruit is of large size, and what is an important quality, hangs well upon the tree. The form of the fruit is shown in the engraving, from which will be seen the peculiar insertion of the stem, which is very short in proportion to the size of the fruit, and the somewhat curved form of the pear. The skin is yellow, with green and brown dots, and upon the sunny side it is washed with vermilion; some specimens are more or less russeted. When well ripened and colored, no pear can make a finer show. The flesh is very white, fine, juicy, and melting, vinous, and with a delicate perfume. Pomologists differ in their views as to quality; while those of France consider it of first quality, it does not rank with us as more than second rate. The fruit is generally above the medium size, and some very large specimens have been grown. One received a prize at the Horticultural Society of Paris, that weighed one kilogramme—or about two and a quarter pounds. The fruit ripens in October, and will, with care, keep into December.

The size and great beauty of this variety make it a valuable market fruit, while the excellent qualities of the tree commend it to the planter.

Straw Covers for Hot-Beds and Cold Frames.

Some covering for the sashes of a hot-bed or cold frame is absolutely necessary to prevent the loss of heat by radiation at night. Shutters, made of light boards, and straw mats are most generally used. We have before described the manner of making straw mats, which are on many accounts the most convenient covering. We have used straw covers, or frames filled with straw, with much satisfaction, and though they are less conveniently stored away than are the mats, they are made with greater rapidity. For the frames, take three pieces of inch-board 3 inches wide, and as long as the sash; lay down two of these as far apart as the width of the sash, and the other one midway between the two; cross pieces, of half-inch stuff, 3 inches wide, are nailed on at each end, and similar pieces are nailed on between the end pieces at distances of a foot. Now turn the frame over and fill it with straight straw regularly laid in, and nail a cross piece over the straw at each end. The straw is to be further secured by a tarred string over it, opposite the cross pieces, on the other side, fastening each piece of string securely by tacks or small nails. Sometimes the frames are made with wooden cross pieces above, instead of the strings, but this renders the frame heavier, and does not allow the water to run off so readily.

Frames of this kind, when not in use, should be put under cover—taking care that they be thoroughly dried before they are put away. The covering and uncovering the beds is best done by two persons, as then the straw frames may be lifted; shoving them wears the paint off the sashes; this may be avoided by nailing strips upon the sashes to slide upon.

Hollies—American and European.

There is, perhaps, no indigenous evergreen tree less generally known than our native Holly, *Ilex opaca*. The reasons for this probably are, that it is found, in its wild state, chiefly near the coast, and its growth is so slow that nurserymen find but little inducement to raise it for sale. Indeed it grows so slowly, that we seldom see it in cultivation, other than as a shrub, while under favorable circumstances it forms a tree 30 to 40 feet high. Eastern Massachusetts is its northern limit, as a native tree, and it is found all along the coast as far as Florida. There are, or were a few years ago, at the Highlands of Neversink, the well-known landmark at the entrance of the harbor of New York, some remarkable specimens of this tree, the trunks of which were as large as a man's body. The tree, when developed under favorable circumstances, is a very symmetrical one, with an erect trunk, of a light ash-gray color, and nearly horizontal branches. The leaves are of the size and shape of those shown in the engraving, of a very thick leathery texture; they are sharp-pointed and their wavy margins bear sharp spines; their green color is not so dark as that of the European Holly, and their surface is less shining. The flowers are not showy, being of a greenish white. These are succeeded by bright scarlet berries, which remain on all winter, and give the tree a brilliant appearance. From its intrinsic beauty, as well as from the traditional association of Holly with Christmas, this is one of the evergreens most sought after for holiday decorations. The wood of the tree is very hard, and is used for making small articles in which this quality is required, such as screws, whip-handles, etc. It is considered to take color better than any other wood, and is used for fancy cabinet work. The Holly may be raised from seeds, but they require to lie in the rot-heap a year before planting them. Where it is found growing wild, there are usually plenty of young seedlings that may be removed in early spring. Naturally, our Holly grows in a great variety of situations, and seems to flourish in both dry and rocky soils, and in low lands. In cultivation it does best in a partial shade. Were it not for its very slow growth, this Holly would be an admirable hedge-plant, but we do not find it used for that purpose, and when met with in cultivation, which is rarely, it is found chiefly as an ornamental shrub, or at most, as a small tree.

The European Holly, *Ilex aquifolium*, has the same general character as our own, but its foliage, as shown in figure 2, is of a different shape, and of a shining green that makes it a much handsomer plant. It is largely employed in Europe as a hedge-plant, as well as an ornamental tree or shrub. There are many varieties,

having leaves in shape and size different from the ordinary, as well as several with the leaves blotched and margined with white and yellow.

Fig. 1.—AMERICAN HOLLY.

Some of these striking varieties are among the most highly prized shrubs for the lawn. The

Fig. 2.—EUROPEAN HOLLY.

European Holly is not hardy enough with us, to be recommended for general cultivation, though in some sheltered localities it succeeds tolerably well. We have four other evergreen species of *Ilex*, all shrubs; these, except the Ink-berry, are mostly southern. The Black Alder, so conspicuous in autumn for its numerous scarlet berries, was formerly called *Prinos*, but is now put in the same genus as the Holly, and called *Ilex verticillata*.

The Use of a Straw Bed.

Last year we gave an account of growing potatoes under straw in the larger way, we now present the garden experience of "Hoo-sier," Rush County, Ind.: "Last summer I planted my potatoes under straw, just as an experiment. I planted the 'Peach Blows,' and, by the way, there no better potatoes. The potatoes were planted in drills, two feet apart, the distance between the potatoes being about six inches; covered them with a light coat of soil, then about six inches of old straw. They came up finely and grew well. The bugs made an assault on the vines, but I opened my light artillery—a little coal oil and a brushy switch—upon the greedy host, and shortly nota 'blistering imp' could be found. This fall, when potato digging time came round, I had an easy job of it. With a fork I turned over the straw, and there clear and bright lay the erimson erew. Picking them up was an easy matter, and soon they were beyond the chilly winds and withering frosts. They turned out exceedingly well, but the ground mice, moles, and rats, left many proofs of their festivals. "I did not find a single decayed potato among the lot, a rare thing for this year, for 'King Rot' has swept, scourge like, over the land. Next year all the potatoes I plant, early and late, shall have a straw bed over them. The straw enriches the soil, keeps it mellow, and makes an excellent garden plat, free from weeds and grass.

THE "BIG TREE" OF CALIFORNIA.—It is a singular fact that some trees make a more rapid growth, and flourish better in every way, in a country quite different from their own. Our most rapid growing deciduous and evergreen trees are foreigners, and in California, that land of remarkable trees, an *Eucalyptus* from Australia is found to excel in vigor any of the native trees, and will probably become the leading tree of the country. In Great Britain, the *Sequoia gigantea*, the California "Big Tree," which with us is at best uncertain, flourishes remarkably. Some statistics have been published by the Scottish Arboricultural Society, giving the height and age of trees of this species, in different parts of the kingdom. Several at the age of five years are twelve feet high, others at seven years are eighteen feet, and trees ten years old are about twenty-one feet in height.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Household Ornaments.

Household ornaments are not perhaps so essential in the country as in the city, where people are necessarily cut off from the fields and woods with their thousand beautiful things. But every where pretty articles of furniture are prized, and perform an important office in the education of children. The only objection to them in many houses is their cost. We frequently give illustrations of such ornaments, and show how they may be constructed. Any one ingenious with the knife or handy with the needle can learn to make them, and thus add to their own usefulness, while they adorn their houses.

Fig. 1, shows a match safe, made from a common cigar box, or any other thin bit of board. It is easy to have black walnut, butternut, oak, or other ornamental wood sawed thin for this purpose. The shield should first be marked out with a pencil according to the design. The cutting can all be

Fig. 1.—MATCH SAFE.

done with a sharp penknife, and will afford very good amusement for a winter evening. The large star in the centre forms the hole to hang up the box when finished. The box, made as shown in fig. 1, can be put together, and fast-

ened to the shield with a little glue. Such a match safe, hung up over the mantle piece or near the stove where the fire is to be kindled or lamps lighted, will help essentially in the formation of orderly habits. There will always be a place for the matches,

and the matches can be kept in their place. By enlarging the pattern, boxes can be made that will answer other purposes. Fig. 2, shows a bracket shelf, consisting of three parts, and made like No. 1. The article may be suspended upon the wall in any convenient place by small brass rings near each end of the shelf, or upon brass headed pins or common

Fig. 2.—BRACKET.

nails fitted for the tops of the grooves under the shelf. The pins give the firmest support. *B*, in fig. 3, gives a side view of the bracket, which goes under the middle of the shelf to support *A*. This may be fastened to the back and to the shelf with small wooden pins and glue, or with the glue alone. The pins make the best job. After the work with the knife is done, fine sand paper may be applied to give it a finish. It may also be varnished, or rubbed over with linseed oil.

Fig. 4, shows a pattern of a pen wiper, and calls for the needle and scissors. It may be made of any convenient size or material. The foundation piece may be of broadcloth, the top of silk, and the intermediate pieces, for the process of wiping, of less valuable cloth. The mice are the nicest part of the work, and require mouse colored velvet, and some

Fig. 3.

beads for the eyes. The bag of malt may be filled with any substance that will present a smooth surface. If shot or sand are put in it, the article will serve the double purpose of pen wiper and paper holder, quite as good if not as pretty as the manufactured glass ones that cost a dollar or more.

Fig. 5, shows another pattern of the same article, with a little different material to imitate the poodle dog's hair. The idea shown in these illustrations

Fig. 4.—PEN-WIPER.

will suggest many other patterns for the use of our readers. Such articles are a great convenience upon the writing desk and table, and look much better than a white rag or old piece of newspaper bedaubed with writing ink. They help to cultivate

Fig. 5.—PIN CUSHION.

habits of order and neatness, and indirectly adorn the persons making them as much as the room.

Leaves from the Diary of a Young Housekeeper.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.*

Dec. 26, 18—It is now a month since I became a happy bride. We have been visiting our relatives, my sister Emeline and Edward's married brother, where I have been taking notes as to their modes of housekeeping, hoping to become better prepared for the responsibilities I have assumed. A few days ago we came here to our new home, and, while Edward has driven over to the village with a load of wheat, I have been folding and stitching together some sheets of paper, on which I design to keep a record of my success, perplexities and observations

*The Committee of Judges, on the Prize Essays, as noted last month, gave long and patient attention to the seventy-nine essays sent in. The numbers refer to the marks upon the manuscript to distinguish them, the Committee being entirely ignorant of the names of the writers. The publishers very cheerfully acceded to the recommendation of the Committee, and will give three prizes of \$100 each, instead of the one offered. We print the opening chapters of two of the Essays. The third one is very fully and prettily illustrated, and it will be reserved for use hereafter, as the engravings will need time for preparation. Our thanks are due to the great number of intelligent and enterprising housekeepers who have contributed their efforts. We are only sorry they could not each receive a first prize.—Eds.]

REPORT OF THE COMMITTEE.

To Messrs. O. Judd & Co.—The ladies assigned the task of examining the articles offered for your prize, have felt very much embarrassed by the richness and variety of the materials presented. There were seventy-nine of the competitors, representing almost every section of the country, and every variety of country housekeeping. These communications have all been read, and the merits of the few that came near to the required standard of excellence, have been thoroughly discussed. After mature deliberation, we have come to the unanimous conclusion that the communications marked No. 45, No. 36, and No. 1, are of equal merit, and, availing ourselves of your permission, we assign a premium of one hundred dollars to each of these three, instead of to only a single one, as at first offered.

Several others show very marked excellencies, and contain many valuable hints, that we should like to see embodied in a volume on household economy. We have no doubt that from the material here presented a more complete work on housekeeping can be compiled, than has yet been given to the public. Yours, Respectfully, THE COMMITTEE.

as a housekeeper. This idea was suggested by looking over Edward's farm books with him last night, in which he has an admirably-kept journal of everything he has done, and everything he has learned since he purchased the farm three years ago. Another motive that stimulates me in this enterprise is the perfect manner in which he keeps up everything on the place, and I am sure I can do nothing that will more directly conduce to his happiness than to show him, within doors, the same evidences of care, system, and order, which he has stamped upon every part of the premises.

Day before yesterday we walked all over the farm, and through the outbuildings. I noticed that the fences are all in good order, the gates on their hinges, and the bar posts upright, which, I have heard my father say, are invariable signs of good farming. His implements are all in order; the dirt scraped off the ploughshares, the harrows well stowed away, the collars thoroughly protected from frost, and the axes ground sharp for a winter's foray among the timber. Now, I am determined to equal him in my department if I can; especially as I find that, in the plan of the addition which he has made to the old farm-house he found here, he has made for me the best arrangements for doing my work easily and rapidly, that I ever saw. He has a map of his farm and buildings, which he spreads out before him when he plans the next year's crops and improvements on the place. Why should not I map out my domain, especially as it is a realm that I love to call my own? The old part of the house is very much in the usual style—two large rooms below, and two above, with halls between, and bed rooms adjoining; but this *L*, which Edward planned, and much of which he built with his own hands, is a gem of a place for a diligent housekeeper, who knows what she wants. Here is the plan:

A is the principal door opening on the north side, *B* another door leading into the old house; *C* the bed-room door, and *D* leads into the wood-house. There are two windows on the south side, between which stands my work table, and one on the north, throwing light on Edward's business desk, which occupies the corner between the doors *A* and *B*. At the right of *B* is my dining table, over which hangs a fruit picture, which I painted when I was a school girl. At the window on the left of my work table Edward has fastened a couple of shelves, where I can have my geraniums, and they are blooming now in that sunny exposure. *S* is my stove, standing just midway between the sink and the pantry.

PLAN OF HOUSE.

There is a pump in the sink, as well as a waste water pipe. At the right of and just behind the stove is a small sliding door, marked *w*, which opens into a box in the wood-house, containing split wood and kindling. Edward fills it when he does his morning chores. I never saw such an arrangement anywhere else, and I find it in the highest degree convenient. There is no running out into the wood-house after an armful of wood, and there is no litter of chips or dirt about my stove. The pantry has a north window in it, and a wide shelf running all along just below the window seat. This serves as a cover to my barrels, which will just slip under it; and here, without moving more than a step, I can lay my hand upon everything necessary to do all my cooking. By opening the door the heat from the stove makes it comfortable to work in, and at night prevents my milk and provisions from freezing. In the summer, by keeping the door shut and the window open, I shall find it a cool place for my milk. This arrangement of sink, stove, pantry and working table enables me to keep all my work in one end of the kitchen. My wood, water, provisions and stove are so near each other that a step or two will bring me within reach of everything that I need. I can accomplish twice as much in an hour here as I could in mother's kitchen,

which was built in the old style, and without any reference to economy of labor, or value of time.

In that, the pantry was in one corner of the room and the sink and pump in the opposite corner, with the stove half-way between; every stick of wood had to be brought up half a dozen stairs, and when the table was set there was no part of the room where one who was sewing or reading could be out of the way. I like the finish of the wood work, too; it is chestnut cut on the place, rubbed with oil and varnished. The grain is handsome, does not show dirt, and can be easily cleaned. The hard-finished walls are painted of a light chestnut color and varnished, so that I shall never need to whitewash them, but only to wipe them down in spring and fall with a wet cloth.

Just outside of the kitchen, in the wood-house, is a large cauldron set in masonry, where I can have my washing done, and where a large quantity of water can be heated for butchering, and other farm purposes. Only last night Edward was talking with me about a girl, and said I should have one if I wanted. I told him he had prevented the necessity of any such help by his plan for the kitchen. What do I want of a Biddy, when, in an hour after each meal, my work is all done up, and the kitchen is as quiet and neat as a parlor?

Dec. 28.—I picked up a volume of *Hall's Journal of Health* last evening, and was so deeply impressed by a well-written article which it contains on the subject of ventilation that I have determined to make a change in one feature of my household economy. Mother used to have us make up our beds the first thing in the morning, but I am satisfied that if I want to keep my bedding, which is now very nice and new, perfectly sweet and wholesome, I must air it every day. So this morning, notwithstanding the cold, while Edward was lighting the fire, I opened the window, which, fortunately, has a southern exposure, laid the blankets and pillows where the air and the sun will fall upon them, and there I mean to let them stay until I have done all my other work.

Dec. 30.—My washerwoman has just gone. This is Monday, and I always did like the plan of having the washing and ironing done up in the early part of the week. She has been at work all day, consumed a good deal of wood, and now her last clothes are frozen on the line, where they must stay all night. If she had had two hours of midday sun upon them, they would have been dry. There must be some improvement on this. I will talk to Edward about it, whether it is not best to buy a wringer, and perhaps a Doty washer, so she can do the washing in the forenoon, and part of the ironing at least in the afternoon. I have heard that washerwomen don't generally like these inventions. Very well; I'll learn to use them and do the washing myself; or, what may be better still, I will pay her a whole day's wages for half a day's work. I am sure that poor women ought not to be made to suffer for want of employment by the multiplication of labor-saving machines.

Mem.—Find out about the different kinds of soap; which is the best, and what soaps are injurious to fabrics. I presume I can learn something on the subject by looking over Edward's *Agriculturist*.

Jan. 28.—The weather has moderated very much, and I asked Edward if the hams did not require attention. He thought they did, and I went to my cook-book for instructions. This is the first time I ever had anything to do with the curing of hams. Following a suggestion I found in Mrs. Child's "Frugal Housewife," I rubbed over them a mixture of saltpetre and molasses, using an ounce of saltpetre and a quart of molasses to eight hams.

Jan. 30.—I have just been looking over Edward's wardrobe to see if I cannot fix him up a suit of plain but warm clothing that he can wear in the woods, so as to save the business suit he bought last fall. I find I can get him out a good substantial vest, buttoning up to the chin, from the skirts of an old pilot-cloth coat that he has worn thread-bare and thrown aside. He was talking yesterday about a new every-day vest, and this will surprise him. I can get a pattern by ripping up an old vest, and the coat linings will do for the back of the

vest; and as to how to make it, Mrs. Wilson will tell me, and I will go over and see her about it as soon as Edward goes away after dinner.

Leaves from My Journal.

PRIZE ESSAY BY MRS. MCLELLAN, OF OHIO.

January, 1867.—A shade of sadness steals over me, as for the first time I write the new year. How many memories gather around the past, tender and sad as well as joyous. How many questionings and anxieties about the future. But when shall I learn that truest happiness is found in the right improvement of the present. "In the morning sow thy seed, and in the evening withhold not thy hand."

Hannah has gone home for a few weeks. She needs some time for fitting up her wardrobe, as well as a change from the unceasing treadmill of housework. I can spare her better now than at any other time, but must be busy to accomplish all I have in hand.

I have become so interested in making little frames for pictures. I make them of pasteboard, of any shape I fancy, and cover them with cones, acorns, seeds and shells, putting them on with glue, and finishing with a coat of varnish. Some choice engraving or photograph can in this way be provided with a pretty frame at trifling expense. My husband said to a young friend to-day, that I had got so taken up with *fancy work*, he supposed I should want to do nothing else now! I knew he didn't mean it, by the roguish twinkle of his eye. Besides he is just as much interested as I, giving me a hint here and there about the frames, and insisting upon varnishing them, though I really wanted to do it myself. I intend next to make some lamp brackets, like one described so pleasantly in the August *Agriculturist* last year.—I know I should like them, for haven't I so often had to run up-stairs and hold the lamp for Nellie, while she dressed her hair?

I had poor bread to-day. I have no patience with myself when that happens. The provoking part of it is, that I can always tell *exactly* what was the trouble, when too late to remedy it. To-day I let it rise too long. A neighbor came in for a little while. Being without help, I should have asked her to sit a few minutes in the kitchen, while I molded it; but I foolishly waited until she went away. If bread rises until it passes from the saccharine to the vinous fermentation, it is past help. It has lost its wholesome and nutritious quality. No art can restore it. Bread must not be neglected or forgotten. It must have a chief place in the mind until safely out of the oven. Two things are absolutely essential to good bread—flour No. 1 and light sweet yeast. With these no housekeeper should be satisfied with bread of only medium quality. It is far better, after testing a rule and finding it good, to abide by it than to experiment with new recipes. Here, literally, "practice makes perfect." This is my recipe: Boil twelve peeled potatoes, and mash them well. Add a quart of the water they were boiled in, while hot, and a cup of sugar. When cool, add a quart of cold water, and a half pint of fresh yeast. Let it stand in a warm place twelve hours, after that shut it up tightly, and keep it in a cool place. It will rise quickly and make delightful bread.

I called round upon my young friend Lizzie Mason to-day. Her mother was a dear mate of mine in our girlhood days. I should love Lizzie for her mother's sake, but I love her for her own as well. It more than repays me for any little advice or encouragement I may give her, to enjoy the freshness and heartiness of her first year at housekeeping, and to have a good laugh over some of her failures and mishaps. They carry me back to days of "auld lang syne." No medicine is so good for a care worn housekeeper as a merry laugh. But to-day Lizzie wore a troubled brow. Baby was fretful, and such piles of work stared her in the face, while really she could do none of it. Mr. Mason and baby both needed warmer clothing at once, and the housework was getting sadly behind. "Why, Lizzie," I said, "what a heavy burden you are carrying about. Do throw it off at once. The wrinkles

are on your face already!" "That is just what Henry told me at dinner," she replied. "He said he would rather hire all the sewing done than have me so troubled about it. But you know he is just beginning for himself, and I want to help him all I can. It seems shiftless for me to hire sewing with only my little family to care for." Well, Lizzie, I used to say just the same, but I look at it differently now. Young wives and mothers are too proud, and too ambitious. They want to do every thing themselves, and be esteemed model housekeepers, when in fact they are not yet through with the alphabet. You are not strong. Your little one is worrisome. The care of that as well as of your house is new care. You make *hard work* of it. By degrees you will get along easier. You will learn where to take the advantage of your work, and how to favor yourself some, while at the same time you will accomplish more. It is a new thing for you to have the long night of refreshing sleep, parcelled up into naps so broken and unquiet, that the morning finds you even more weary than bed-time. It is just here that so many young wives break down; and becoming discouraged at the prospect before them, indulge in a complaining spirit, and an inefficiency, fatal alike to their own happiness, and to all with whom they are associated. Settle some points in your mind, the sooner the better. First, take proper care of your own health. This is the greatest kindness to your husband in a pecuniary as well as domestic sense. You cannot violate nature's laws with impunity. Exercise in the fresh air every day; if nothing more than a brisk walk on your piazza, throwing your arms backward and forward, receiving into the lungs that which shall change the torpid and impure blood to a life giving current, imparting energy and strength to the system. Take good care of your child. Make it comfortable and happy as far as in your power. Prepare wholesome and nutritious food for your table. If Mr. Mason provides abundant material, he has a right to expect that on your part it shall be turned to good account. Next in order is sewing. Have one or two garments ready, and sew when you can. *Don't think* of others, until these are done. Select that which is most difficult and irksome, and hire some one to do it for you. You will not, by and by, with half a dozen little ones around you, carry such a load as you are sinking under to-day. I think my long lecture did her good, for she told me in parting that she should not forget it, though the "half dozen little ones" she should banish from her memory, with the piles of sewing I had said must have such a fate. From the brow of the hill, as I looked back, I saw her on the porch, going through with such evolutions and attitudes, that a stranger would at once have pronounced her crazy!

February.—"A place for every thing, and every thing in its place." How invaluable this rule to the housekeeper. For every article in common use about a house, a place should be assigned, and each member of the family distinctly understand it must be found there. Any one in the dark should be able to put hands upon it. How much time and patience is thus saved. Hannah, though a good girl in many respects, cannot have the bump of order well developed, at least, if there is any truth in phrenology. How annoying to be questioned as to the whereabouts of missing articles, and then find them in some out of the way place, where she has carelessly left them. To-day, after she had commenced washing, the floor was covered with water. I found she had left the tubs in the woodshed all the week, instead of taking them to their true place in the cellar. Then she had a long hunt for the indigo bag. Had I not taken it from the pantry? She was so sure she put it there last Monday. She would have been just as sure the tubs were in the cellar before commencing washing.

Finality on Rats.—The only effectual remedy is cement on the bottom and sides of the cellar. They cannot get through this, and so cannot find entrance to the house. Now is a good time to invest in sand, water and lime.

BOYS & GIRLS' COLUMNS.

The Eyes may Deceive.

Most persons readily believe what they "see with their own eyes," but even these reliable witnesses may give a wrong impression. This is often the case when a person is much influenced by fear, hope, anger, or any passion or strong excitement. Great love makes a mother think her children are handsome, although they may be homely in the eyes of others. Hatred makes even beautiful objects appear ugly. The snake is really a beautiful and singularly graceful creature; yet it looks hideous to most persons, because of their fear or their superstition. A recent incident shows how fear may deceive the eyes. A woman who had great dread of robbers, always looked carefully under her bed before retiring. One night she came running down stairs and alarmed the family by wildly declaring that somebody was under her bed, as she plainly saw his face. Some of her friends immediately made examination, and found she had indeed seen a face, but it was only her own reflected from a looking-glass which had been stowed away there during the day! Had not the matter been investigated, she would always have been persuaded that a stranger had hid himself in her room. Hundreds of persons have been deceived by their eyes, while under the influence of fear, into seeing ghosts, as they supposed. When very improbable stories are related by persons who claim to have been eye-witnesses, it will be well to remember that the eyes can not always be trusted.

A Curious Bouquet.

Our artist having succeeded in making up faces in a rather curious manner last month, (see Jan. No. page 23) has tried his hand again, and sends in this sketch of a bouquet, where he says, girls and boys with sharp eyes will find many curious features, which do not appear at first sight. Study every flower and leaf carefully, see how

many portraits you can find and point them out to your friends. There are said to be a good many of them.

A New Plaything.

Our young friends who are afraid of harmless snakes, may, perhaps, overcome their dislike by making such a one as we recently saw; it is shown in the engraving. Take a straight piece of soft pine wood two feet long. Whittle it into the form of a snake, supposing him to be stretched out, and frozen stiff. Next cut out a little groove along the top of the back, and another exactly under it

along the belly, just wide and deep enough to allow a piece of fine strong cord, like a small fishing line, to lie in below the surface, as shown at C, fig. 2. Also, bore a hole to pass the line through the head from the top to the under groove. With a fine saw cut down through on each

Fig. 1.—THE SNAKE COMPLETE.

side of the snake, nearly to the middle, making the cuts exactly opposite, and an inch apart, except at the head and

Fig. 2.—SECTION OF BLOCKS.

tail, each of which may be left about two inches long. Fig. 1 shows nearly how these cuts should be made. Then cut the front edge of each division beveling about one-quarter of an inch down to the centre. This will separate the snake into inch pieces. (B), fig. 2, gives the shape of each piece, looking from the top. (A), fig. 2, represents the back end of each piece. Arrange the pieces in proper order, in a straight line, from head to tail, and, with a fine brush partially fill the top groove with glue. Then pass the cord through the hole in the head piece, crowd it down snugly into the glue, bringing each piece close up to the one before it. Turn the snake over, glue the under groove, and fasten the other part of the string down into the groove of the belly part, throughout the whole length, the same as on the top part. Leave it until perfectly dry, and you will have a wooden snake that will squirm alarmingly. Two pin heads for eyes, and a little paint skillfully applied will complete the resemblance to nature, and make an amusing plaything. Do not selfishly use it to frighten the timid.

Ants—Strong Little People.

The patient industry of the ants is an old lesson with us, and in some lands their power for good or evil rivals that of the fairies, especially if we include the "African" "termites" which generally go by the name of white ants. All at once a swarm of small, winged creatures, not unlike a cloud of snow flakes, fill the air. They are eagerly snapped up by dogs and other animals; and, moreover, great numbers are caught by the native negroes who eat them as a great delicacy. The bodies of the insects are about half an inch long, and of a whitish color, so that when boiled or roasted they resemble grains of rice. Those which escape this use, waste no time fluttering around, like idling butterflies, but making a first and last flight, alight by instinct upon a spot suitable for their future labors. Dropping the now useless wings, the industrious ants set about their work with a good will, and grain by grain the soil is bored and lifted and placed. Chamber after chamber is built, each connected with others by covered galleries or bridges, until a hill arises thirty or forty feet high, with a base in proportion, every particle of which has been carried by the tiny workers. While building their homes the ants do great good by removing old logs and other decaying matter, which they dispose of with wonderful rapidity. The hills thus formed become, in the way of soil, almost as good as hot beds, and the natives make gardens upon their sides. Some parts of the country are overflowed a large portion of the year, and only the ant hills, covered with trees, rise above the red surface of the marsh. There is also another family of ants, which do as much

in their way as the termites. These black ants, or soldiers, as they are called, build no hills, but dig out their homes under ground. They prey upon all kinds of small creatures, and will, in a short time, make way with the carcass of a large animal. Not unfrequently they go on a raid into a village, and overrun the huts in their paths, so that the natives are obliged to retire until the little invaders have cleared the huts of every species of vermin which infest their not over neat dwellings.

The black ants constantly make war upon the termites, and it has been thought that they carried off the white ants to work for them. But as the little hard legs of the termites are often seen near the holes of the soldier ants, these small cannibals probably eat their captives.

These black ants store away such quantities of the small kinds of grain used there, that the natives often dig for it in times of drouth and scarcity.

Nothing can stop an army of ants when once started, and it is very interesting to watch their wonderful ingenuity in getting over obstacles. For instance, if a stream of water is in the way, one ant clings to another until a chain is formed, firm at one end, and floating in the air, long enough for the free end to reach the opposite side of the stream. Then the whole army passes over on this living suspension bridge.

Besides the soldiers and termites, there is a small red ant much dreaded by those who have felt their bite. Not content with their burning sting, they twist the little crooked claw about in the wound, and such is the fierceness of their attack, that an ant can rarely be pulled away from the flesh without being torn apart.

Very little people, if they did all they could as faithfully as the very little insects, might be surprised to find how much they are worth in the household. And like the ants, if they don't do good they do harm. Old folks at least know how much discomfort and mischief may be accomplished in a home by a five year old child.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the January number, page 25: No. 245, *Mathematical Problem*.—90 guns, 670 sailors, 53 soldiers....No. 246.

Illustrated Rebus.—Ill news flies fast (*Fly's fast*)....No. 247. *Mathematical Problem*.—Draw a triangle with the apex of its angles bisecting the sides of the given triangle, and the four required parts will be found....No. 248, *Mathematical Problem*.—Distance from C to D, 14 miles; from D to E, 40 miles; from C to E, 54 miles....No. 249, *Illustrated Rebus*.—Effeminacy and cowardice go hand in hand with indolence and luxury....No. 250, *Illustrated Rebus*.—To be elbowed.

The following have sent correct answers up to January 12th: J. T. M. W., Robert Robertson, M. Olden, J. E. Bonsall, "R. D. W.," Henry Colgate, J. Morris Leeds, Edmund J. Young, Alice Sult, "E. M.," James M. Evans, J. W. Diddle, Emma Findley, M. D. Wires, W. James Haskell, Mollie E. Jocoby, J. C. Norton, E. Leonard, Clarence C. Howard, H. P. Guirrant, Eli Meudenhale, J. T. Norton, Samuel Yeakle, Jr., "Old Rusty," Jennie Cook, Eugene Lane, Almeron, O. Meade, "A. H. S.," Willie and Berrie, W. S. Carver, Irwin Chase, Ella Staples, Emma Sturmvald, John Andes, J. K. Hallock, A. H. Mahaffey, Frank A. Lawrence, William Worden Marryatt, Franklin Belford, James and Edward Jones.

No. 252. *Illustrated Rebus*.—For Farmers' boys to study.

[COPYRIGHT SECURED.]

A HARE-BRAINED TEAM.—FROM AN ORIGINAL PAINTING BY OTTO EBERLEIN.—*Drawn and engraved for the American Agriculturist*

A fine ride this little fellow was taking across the fields, with his strong and well trained team of dogs. They had often carried him safely before, and he could not have expected such a ludicrous and somewhat dangerous experience as he is now having. The dogs did very well until strong temptation came before them; then they could see nothing but the hare, and forgetful of the voice and the lines of the driver, away they rushed, leaving their unlucky young master to look out for the consequences. Probably after this he will be careful how he takes them over that road again. We have seen many a lad thus run away with, not by dogs, but by his own thoughts, when he had left the places and companions which his parents judged safe for him to have, and got into the way of temptations among bad company. One poor young man we know, was lately thrown down from a fine position in a bank, being run away with by his passion for gambling—his character ruined for life; another is losing his good name in the bar-rooms, where his appetites have drawn him; and many more are in danger of having their honesty shaken out of them by taking short cuts "across lots" in their haste to get rich. The "old ways" are safest, in driving a team, or in making the journey of life.

A Master Workman's Tools.

The great natural philosopher, Dr. Wollaston, was once called on by a scientific foreigner who desired to see his laboratory, and inspect the apparatus with which he had made his splendid discoveries. "Certainly," was the reply, and he immediately brought out a small tray containing some glass tubes, a simple blow-pipe, or bent metal tube worth a few pence, three common watch glasses, a slip of platinum, and a few other similar things. On another occasion, shortly after Wollaston had ju-

spected a grand galvanic battery, he met a friend in the street, and seizing him by the button he led him into a quiet corner, when, after looking carefully about him as if engaged in some strange mystery, he took from his pocket a tailor's thimble, in which he had constructed a galvanic arrangement, and pouring into it the contents of a small vial, he instantly caused a bit of platinum wire to become quite hot.—Our young readers are familiar with the experiment of Dr. Franklin, who, with only a common kite, proved that the lightning in the clouds was of the same nature as the electric spark which had been produced by various contrivances. These and many similar incidents show the value of "brains," that with an educated power of thinking, the highest results can be gained with the simplest materials.

Cotton on the Gallows.

Less than one hundred and fifty years ago, the masses of the people of Great Britain believed that the introduction of cotton clothing and its manufacture would ruin the kingdom. Woolen and linen garments were then almost universally worn, and large manufacturers, employing many thousand workmen, were engaged in supplying the demand for them. It was thought that the woolen and flax machinery would be useless and a total loss, and the workmen thrown out of employment, if cotton should take the place of the fabrics then worn. Even Parliament shared this belief, and in 1721, passed an Act imposing a penalty of five pounds upon the seller of a piece of calico. The common people on one occasion, took a singular way to show their prejudice against the new fiber, and to bring it into disrepute. One Michael Carmody was executed at Cork, in Ireland, for felony; upon which the journeymen weavers (who were short of work, and who attributed

the "hard times" to the introduction of cotton manufacture,) assembled in a body and dressed the criminal, the hangman, and the gallows, in cotton, in order to bring the wearing of it into disgrace; and at the place of execution the criminal made the following remarkable speech:—"Give ear, O good people, to the words of a dying sinner. I confess I have been guilty of what necessity compelled me to commit, which starving condition I was in, I am well assured, was occasioned by the scarcity of money, that has proceeded from the great discouragement of our woolen manufactures. Therefore, good Christians, consider that if you go on to suppress your own goods by wearing such cottons as I am now clothed in, you will bring your country into misery, which will consequently swarm with such unhappy malefactors as your present object is, and the blood of every miserable felon that will hang, after this warning, will lay at your doors."—Nevertheless, happily for Great Britain, the wearing of cottons continued to be extended, so that in thirty years afterwards, their yearly manufacture was estimated at \$1,000,000, and at the present day nearly 400,000 steam looms are at work there upon cottons, directly employing at least 500,000 work people, besides the millions engaged elsewhere in producing the staple.

A Curious Book-Worm.—A friend recently at a book sale in New York, describes a book that he saw containing a singular mark made by a small worm. The insect had first bored through the outside cover, near the bottom, then worked his way through the pages on the margin below the print, until it came to the last page, where it had excavated a snug burrow for raising a family; then it, or one of its progeny, continued on and made its way out through the back cover, leaving through all its course a small hole as if made with a large pin.

of

KITCHEN GARDEN

and

AGRICULTURAL SEEDS,

for 1867, is Now Ready,
and mailed free to all applicants.

ALFRED BRIDGEMAN,
No. 876 Broadway, New York.

New and Rare Vegetables.

I present to the Public my Annual List of
New and Rare Seed for 1867, many of which
I send out the first time this season.

MARBLEHEAD MAMMOTH DRUMHEAD CABBAGE.—(The largest Cabbage in the world. Weighs from thirty to sixty pounds to the head, and is tender and sweet. No cabbage does so well in the South as this.) **CANNON BALL CABBAGE.**—(About as round and hard as a cannon ball. An early sort, and the hardest heading of all Cabbage.) **STONE MASON CABBAGE.**—(Standard variety of Winter Drumhead Cabbage in Boston market. Under good cultivation every plant on an acre will make a large and hard head. It is remarkably tender and sweet. In half-bush packages.) **LENORMAND'S MAMMOTH CAULIFLOWER.**—(A new variety, the largest of all the Cauliflower family. Very reliable for heading.) **VERY EARLY ERPUFT CAULIFLOWER.**—(New, remarkably early, and fine for hot-beds.) **NEW YORK IMPROVED EXTRA LARGE PURPLE EGG PLANT.**—(This grows to a large size, and is of a richer color than the Common Large Purple Egg Plant.) **STRIPED GAUDELOUPE EGG PLANT.**—(An elegant variety for the table. The stripings of white, purple and yellow give it a magnificent appearance.) **ORNAMENTAL KALE.**—(The great variety in color, and structure of the leaves, make them elegant ornaments for the flower garden and among shrubbery.) **MAMMOTH SWEET CORN.**—(The largest of all Sweet Corn. Sweet, and excellent for the table. The ears weigh, as gathered, from two to three pounds each.) **MAMMOTH FRENCH SQUASH.**—(Sometimes grown to weigh over two hundred pounds. They grow well-proportioned, and are finely colored.) **VEGETABLE CATERPILLARS.**—(Vegetable curiosities, the seed-vessels resembling caterpillars.) **VEGETABLE SNAILS.**—(A French Oddity, the seed vessels of which resemble snails.) **VEGETABLE WORMS.**—(Another curious vegetable product.) **SNAKE CUCUMBER.**—(A very long variety which grows coiled up, having the appearance of a large snake.) **LANTON'S PROLIFIC EARLY LONO POD PEA.**—(A new and quite distinct variety. Many of the pods contain from ten to twelve Peas each.) **DWARF INDIAN CHIEF BEAN.**—(Those who have grown the Pole Indian Chief will be pleased to find a bush variety of this fine String Bean.) **GIANT WAX BEAN.**—(A new Pole Bean, being an improvement on the Indian Chief, it being a larger and longer Podded Bean than that choice variety. The Wax Beans (so called because the pods are of a wax color) are the best of all String Beans.) **NORBITON'S GIANT CUCUMBER.**—(A new English variety, the finest, longest, and most prolific Cucumber in cultivation.) **WARD'S NECTAR MELON.**—(When compared with all other sorts, this has been awarded the palm as the best of all green-fleshed Melons.)

Each of the above sent to any part of the United States, and warranted to reach the purchaser, at twenty-five cents per package.

AMERICAN TURBAN SQUASH.—(The dryest, finest grained, and best flavored of all Fall Squashes. The packages contain about fifty seeds.) **HUBBARD SQUASH.**—(I was the original introducer of this, and the seed is true.) **YOKOHAMA SQUASH.**—(A new variety from Japan; very prolific. The quality resembles a fine Crookneck, but is much superior.) **BOSTON MARROW SQUASH.**—(My variety took the premium for purity at the Annual Fair of the Massachusetts Horticultural Society in 1865.) **PARA SQUASH.**—(A bush Squash from South America, which can be kept into winter. Oblong in shape, of good size, fine-grained, and excellent quality; far superior to any standard variety of bush Squash.) **IMPROVED GREEN GLOBE SAVOY CABBAGE.**—(For family use, the Savoy is the richest of all Cabbages. The heads of this variety are large, hard, and of most excellent quality, the stumps short. Remarkably reliable for heading.) **PANCAILER SAVOY.**—(The French consider this the earliest Cabbage grown.) **SMALL EARLY ULM SAVOY.**—(Very early and reliable.) **BURNELL'S KING OF THE DWARFS.**—(In England this is considered the earliest of Cabbages. Very dwarf, fine quality, and sweet.) **LARGE BRUNSWICK SHORT STEM.**—(A very large and very early Drumhead, much sought for by market gardeners.) **LITTLE PIXIE CABBAGE.**—(An early dwarf; stump, short; heads pointed, and very hard, fine quality, and very sweet.) **TILDEN'S NEW TOMATO.**—(Large, round or oblong; color, rich scarlet; vines, dwarf, and very productive.) **EARLY YORK TOMATO.**—(Very early, and remarkably prolific; has yielded at the rate of over one thousand bushels per acre. Fruit of good market size; flat, round shape; quality, excellent.) **COOK'S FAVORITE TOMATO.**—(A large, apple-shaped variety; very prolific; quality, superior; decidedly the best of the apple-shaped Tomatoes.) **MAMMOTH CHIHUAHUA TOMATO.**—(Enormously large, weighing from two to three pounds. Some single specimens will heap a quart measure.) **NEW MEXICAN TOMATO.**—(Very large, round Tomato; a great bearer; resembles, in color, Lester's Perfected, but an improvement on it, in always being round.) **TREE TOMATO.**—(A French variety; grows erect in the form of a bush.) **MCLEAN'S ADVANCER PEA.**—(A new English wrinkled PEA. A decided improvement on the Champion of England; bears well, with Peas equally sweet; is much larger, and does not run nearly as high.) **MCLEAN'S LITTLE GEM.**—(A new dwarf wrinkled PEA; grows about one foot high; very early, only a few days later than the Dan O'Rourke; a decided acquisition.) **VILMORIN'S NEW, WRINKLED, EDIBLE, PODDED PEA.**—(The first wrinkled sort yet found, the pods of which can be eaten.) **CARTER'S FIRST CROP.**—(A new English PEA, sent out as the earliest of all varieties.) **HAIR'S DWARF MAMMOTH.**—(A wrinkled PEA, larger than Champion of England, growing only half its height; quality, fully equal to the Champion.) **TOM THUMB PEA.**—(As early as Dan O'Rourke, grows ten inches high, and is remarkably prolific.) **DREW'S NEW DWARF PEA.**—(Peas, very large, egg-shaped; each plant forms quite a bush. Peas should be planted about a foot apart. Early, dwarf, and very prolific.) **BROWN'S NEW DWARF MARROWFAT.**—(Warranted to be the earliest and most dwarf Marrowfat PEA grown. A capital PEA for market gardeners.) **FORTY DAYS' CORN.**—(Earlier than any Sweet Corn. Desirable as an early sort.) **BATES' EXTRA EARLY SWEET CORN.**—(A variety of wrinkled kernalled Sugar Corn; earlier than Darling's Early, and excellent for table use.) **MAMMOTH FLINT CORN.**—(Ears grow sixteen inches long; stalks very tall and stout, and matures as far North as Central New England.) **CROSBY'S EARLY.**—(The earliest of all twelve

rowed Sweet Corn. The Massachusetts Horticultural Society offered special premiums for this new Corn at their last Annual Fair. It is of good size for market, and a decided acquisition.) **MEXICAN SWEET CORN.**—(I still find this to be the sweetest and most tender of all varieties of Sweet Corn. Nothing can equal it for the table.) **GOLDEN SWEET CORN.**—(A Sweet Corn of golden color; early, of good size, and excellent quality for the table; flavor, fine, and distinct from any other variety.) **YARD LONG BEAN.**—(A curious Bean; pods growing over two feet long; foliage, a rich, dark, glossy green.) **CONCORD BEAN.**—(This new Bean is probably the earliest Pole Bean grown; very prolific, and of excellent quality, either as a string or shell Bean.) **FEJEE BEAN.**—(A new bush Bean; the earliest and hardiest of all beans; very prolific and worthy of general cultivation.) **INTERMEDIATE HORTICULTURAL BEAN.**—(An excellent bush Bean for marketmen. Pods of the same rich color as the Pole Horticultural.) **CALIFORNIA BEAN.**—(A very early, large, flat Pole Bean; excellent, either green or baked.) **MOTTLED CRANBERRY.**—(An improvement in health, vigor, and productiveness on the old-fashioned Cranberry. Few Pole Beans will yield equal to this. Pods, long, large, and well filled.) **SIMON'S EARLY BEET.**—(A new, early sort, well shaped; as early as Bassano, and darker.) **NEW TURNIP BEET.**—(Round, flat-shaped, very early, and very nice.) **CASTLEBANDY BEET.**—(A famous French variety; flesh, a deep purple color, very tender and sweet.) **CRAPAUDINE BEET.**—(Rough skinned; color, very dark purple. Esteemed by the French as the best of all Beets for table use.) **WHYTE'S VERY DEEP RED BEET.**—(Medium size, dark color, very sweet, and excellent for table use.) **YELLOW OVOID MANGEL WURTZEL.**—(For cattle. Of seventeen varieties tested, the crop of this exceeded all.) **EARLY CRACKER ONION.**—(Earliest of all the yellow sort; quality, very delicate and sweet.) **HOOD'S NEW DWARF IMPERIAL PURPLE CELERY.**—(A choice new English variety.) **TURNER'S INCOMPARABLE DWARF WHITE CELERY.**—(A first class English variety.) **READ'S MATCHLESS CELERY.**—(A premium English variety, fine, solid and red.) **BOSTON MARKET CELERY.**—(True. This is the short, compact, solid variety, so often admired by strangers in the markets of Boston.) **TRUE BOSTON CURLED LETTUCE.**—(The most elegant of all the Lettuce family, grows in the form of a Rosette.) **WHEELER'S TOM THUMB LETTUCE.**—(A choice new variety, in high favor with those who have grown it.) **PERIPIGNAN LETTUCE.**—(This is an excellent Lettuce for standing the summer heat. Heads, compact, attaining to seven inches in diameter.) **NEAPOLITAN CABBAGE LETTUCE.**—(One of the finest Cabbage Lettuces yet introduced.) **SIX VARIETIES OF CABBAGE LETTUCE.**—(Six of the choicest varieties in one package.) **ORANGE WATERMELON.**—(When fully ripe the skin will peel off like an Orange.) **ALLEN'S SUPERB MUSK MELON.**—(Quality, superior; by some called the "Queen of Melons.") **LARGE PERSIAN MUSK MELON.**—(A fine, large variety.) **WHITE JAPANESE MELON.**—(Flesh, greenish white, very thick-meated; one of the earliest and sweetest of all melons.) **DWARF BROOM CORN.**—(This is thought to make a better brush than the common tall sorts.) **CHUFAS, OR GROUND ALMONDS.**—(These taste very much like a Coconut; are very prolific, yielding 100 to 1.) **ORNAMENTAL GOURDS.**—(Many varieties in one package.) **NEW JERSEY HYBRID CUCUMBER.**—(A remarkably long variety; an improvement on the White Spined.) **IMPROVED LONG GREEN CUCUMBER.**—(This is the longest of all the Long Greens.) **CHINESE SCARLET EGG PLANT.**—(Of magnificent scarlet color, and highly ornamental.) **MAMMOTH MILLET.**—(Extra tall; seed heads much larger than any other variety.) **SURRY WHITE WHEAT.**—(A new English Winter Wheat, highly recommended for poor soils, remarkably free from blight and rust.) **OTAHITIAN SUGAR CANE.**—(This yields more Sugar than any other variety of Sugar Cane grown in the North.)

Any of the above varieties will be forwarded, post-paid, and warranted to reach the purchaser at fifteen cents each. **EARLY SEBEC POTATOES.**—(Coming rapidly into favor in Boston and vicinity as a first class early market Potato. Large size, excellent quality, and remarkably productive.) **EARLY GOODRICH.**—(True.) **SHAKER'S FANCY.**—(A new variety of white-fleshed Potatoes, considered as early as Early Goodrich, yielding equally well, and rapidly gaining favor in Pennsylvania. This and the Early Sebec are of better shape for market purposes than the Early Goodrich. Four pound packages of either of these varieties sent to any address, warranted to reach the purchaser, on receipt of one dollar. All orders for Potatoes will be put on file, and be filled as soon as danger from freezing is past.

Catalogues containing over two hundred varieties of warranted Garden Seeds, one hundred and twenty-five of which are of my own growing, sent, gratis, to all applicants. I warrant three things: 1st. That my seed is genuine. 2d. That your money shall reach me. 3d. That my seed shall reach you. Can the Public ask for anything fairer than this? **JAMES J. H. GREGORY,**
Marblehead, Mass.

EVERGREENS

In very large variety, including hardy Rhododendrons of all the best kinds, from white to purple.

For Catalogues, &c., apply to

PARSONS & CO., Flushing, N. Y.

JUCUNDA, OR 700.—GROWN BY J. KNOX, PITTSBURGH, PA.

"The illustrations we give (as above), are drawn from Nature; and we can say, are not exaggerations of the specimens which were selected at Pittsburgh, when we were there in June, and sent to Philadelphia the next day."

THOMAS MEEHAN, Editor *Gardeners' Monthly*.

"The above Engraving is a faithful representation, drawn from actual specimens of fine fruit grown on the KNOX FRUIT FARM, at Pittsburgh."

A. W. HARRISON.

"Its flowers are perfect, and fruitful to an enormous extent. I last year counted trusses that had ninety per cent. of perfect fruit upon them, as compared with the number of flowers. A most remarkable point of value in this variety is the great number of extra large berries. I saw great quantities, ten to twelve berries of which filled a pint. These, you must remember, were not merely a few selected ones for the exhibition tables, but there were bushels of them sold every day in market, which brought one dollar per quart. This is equal to four or five cents each, and may be considered rather profitable."

GEORGE M. PEELER, late Secretary Indiana Hort. Society.

"I entirely concur in the statement there made (at the meeting of the Ohio Pomological Society, held in Cincinnati, December, 1865,) as to its great productiveness, its large and uniform size, and its protracted fruitage, but, more especially, as to its brilliant color, perfect form, and extreme beauty, and consider it the most remarkable fruit of its class that has ever come under my observation."

DR. JOHN A. WARDER.

For further information in reference to this the most valuable of all our Strawberries, send 10 Cents for our Catalogue.

Our stock of well-rooted and vigorous plants is very large this season, which we offer at the following greatly reduced prices:

12 Plants.....	\$1.00.	1999 Plants.....	\$40.00.
100 ".....	\$3.00.	3600 ".....	\$100.00.

For Vines and Plants BY MAIL, see extraordinary inducements on page 77.—ORDER EARLY.

GRAPE VINES. CONCORD.

The most valuable grape in the country. More popular now than ever, and is being more generally planted than all others. Very valuable for the table and for market purposes.

"Its wine suits most palates, and sells very readily at \$2.50 per gallon. * * * Average yield about 1000 gallons per acre, this year (1866)."—GEORGE HUSMANN.

Our present stock comprises:

200,000 Strong, 1-year old Vines.	
25,000 " 2 " " "	
2,000 " 3 " " "	

Our vines are grown in the best possible manner, from wood taken from our own bearing vineyards. For prices and other information, send 10 Cts. for Catalogue.

IVES.

The great American wine grape. Average annual yield of wine, 500 gallons per acre, which sells at from \$1.50 to \$6 per gallon.

60,000

Superior Vines for sale.

SEVEN

varieties of grapes which are reliable, healthy, hardy, vigorous, productive, of good quality, and very profitable. CONCORD.—Best known and most popular.

EARLY ORDERS ARE SOLICITED.

J. KNOX,

Box 155, Pittsburgh, Pa.

GARDENING FOR PROFIT.

A Work, instructive alike to the Amateur or Market Gardener, detailing the practical experience of nearly 20 years' Gardening for the New York Market,

By **PETER HENDERSON,**
(of HENDERSON & FLEMING.)

Price, \$1.50, by mail pre-paid.

Or with our New Illustrated Seed and Plant Catalogues for 1867, \$1.75.

HENDERSON & FLEMING,
Seedsmen and Market Gardeners,
67 Nassau-st., New York.

SPECIAL ADVERTISING AGENCY.

The undersigned, at the request of many advertisers in the *American Agriculturist*, has opened a SPECIAL ADVERTISING AGENCY. The "specialty" will be the insertion of good and reliable advertisements only, in the best mediums, that is those which will bring the most business to the party advertising.

An experience of several years in charge of the advertising columns of the *American Agriculturist*, gives the subscriber good facilities for conducting the business satisfactorily. Those who wish to extend their business in this manner, will please address

W. A. FITCH,
Special Advertising Agency,
151 Nassau-st., New York.

FIRST MORTGAGE BONDS OF THE SOUTH WEST PACIFIC R. R. CO.

Principal and Interest guaranteed
by the Atlantic and Pacific
Railroad Company, in
Coupon Bonds of
\$1,000 EACH,
TWENTY YEARS TO RUN.

Due September 15, 1886.

INTEREST AT THE RATE OF 7 PER CENT. PER ANNUM, PAYABLE IN THE CITY OF NEW YORK, ON THE FIRST DAYS OF JANUARY AND JULY.

These Bonds are issued on 77 miles of completed road, now in operation to Rolla, in the State of Missouri, which cost to construct.....\$1,500,000
And 13 miles of road graded, with material on hand, to be completed by January 1, 1887, at a cost of..... 500,000
Together with 250,000 acres of land, now being disposed of at a minimum of \$5 per acre, (maximum \$10)..... 1,300,000

May present total value of.....\$6,300,000

The amount of Bonds issued is \$2,000,000, secured by mortgage to John P. Yelverton and Chas. H. Ward, of New York, as Trustees of the above-named property.

By a provision of this Mortgage, when Lands are sold to the amount of \$10,000, it is to constitute a Special Fund for the redemption of a like amount of these Bonds, at a rate not exceeding 105 per cent. They are also receivable at PAR by the Company in payment of its sales of Lands.

At St. Louis this road connects with all the Eastern Railways, and runs west through the most attractive parts of the State of Missouri via Franklin, St. James, Rolla, Lebanon, Marshfield, Granby (Lead Mines), and Neosho, to the west line of the State. At Springfield it will connect with the great ATLANTIC AND PACIFIC RAILROAD (its eastern terminus), forming a direct and continuous route from St. Louis to San Francisco.

When completed, it will present a road of 310 miles in length, costing about.....\$12,000,000
With 1,036,000 acres of Land valued at... 10,000,000

Showing a total value of.....\$23,000,000

With a total amount of Bonds authorized, with the guarantee as above, of \$7,250,000, which may be issued at a rate not exceeding \$25,000 per mile of completed work as it progresses.

Of the present issue of \$2,000,000 of Bonds, a limited amount is now offered for sale.

WARD & CO. BANKERS,
No. 54 Wall Street, New York.

The Herald of Health

AND

JOURNAL OF PHYSICAL CULTURE.

This is a Monthly Magazine of Fifty-six pages, devoted exclusively to the Physical, Intellectual and Moral regeneration and development of the race.

IT WILL TEACH the Laws which govern the physical organization of Man, and how to obey them.

IT WILL TEACH the Causes of Disease, how to avoid them, and the best and safest method of treatment, by the use of agents which do not poison the system.

IT WILL TEACH how Children should be born and reared, so that they may become perfect Men and Women.

IT WILL TEACH the Structure and Functions of every organ in the body, and the best method of keeping it in a healthy condition.

IT WILL TEACH what is the natural food for man and how it should be prepared.

IT WILL CONTAIN articles upon Bathing and Clothing, upon Exercise, Rest and Sleep, upon Recreation, Amusements and Social Enjoyments, upon Education, Topics of the Month, Home Treatment of Disease, Answers to Correspondents, and upon all subjects calculated to improve the condition, and promote the happiness of mankind.

Each No. for 1867, will contain an article of

HENRY WARD BEECHER'S

upon subjects relating to health.

DIO LEWIS, HORACE GREELEY, O. B. FROTHINGHAM, DR. BELLows, and many other of the best writers of the age will contribute to its columns.

The articles in the Jan. No. on

"Human Development,"

By HENRY WARD BEECHER,
OR

"The Sacredness of the Body,"

By REV. O. B. FROTHINGHAM,
and

"How to Train up a Child,"

By L. N. FOWLER,

are well worth a year's subscription.

The February No. contains

Health Laws and their Penalties.

(By H. W. BEECHER.)

Sources of Muscular Power.

(By PROF. R. KING BROWNE.)

Buildings for the Poor.

(By HORACE GREELEY.)

Body and Brain.

(By PROF. NELSON SIZER.)

How to Bathe.

(By E. P. MILLER, M. D.)

Memory and How to Improve it.

(By L. N. FOWLER.)

And more than 50 other articles of high interest and value.

Read Opinions of the Press:

"A valuable Family Journal, which deserves a kindly welcome as an efficient aid to the progress of Popular Education."—[New-York Tribune.

"In families it is calculated to accomplish much good by a diffusion of needed knowledge of Physiology and the Laws of Health."—[New-York Evening Post.

"The 'Herald of Health' has assumed a high literary character, and its pages are enriched by contributions of some of the most eminent practical writers of the day."—[Ohio Farmer.

"The 'Herald of Health' is a sprightly, spicy, interesting monthly, devoted to physical culture, hygienic medication and the laws of life. For variety of interesting and suggestive reading in its line, it is not surpassed in this country."—[Liberal Christian.

As editor of "The Massachusetts Teacher" "I have read your 'Herald of Health' for years, and think it one of the most sensible and useful Magazines in the United States. You are doing good, and may God bless you."

W. H. SHELDOX, Principal Hancock School, Boston.

This Magazine ought to be in every family. It will save many times its cost in Physicians' fees, besides promoting health, and prolonging life.

Agents wanted in every neighborhood. Price \$2.00 a year; 20 cents a Number. For 50 subscribers and \$60.00, we give for a premium **Wheeler & Wilson's Sewing Machine**, worth \$55.

Address **MILLER, WOOD & CO.,**
151 Light-street, New York City.

Great Household Helps.

LASH'S

Clothes Washer and Wringer.

LASH'S \$5 WASHER.

The originator of

LASH'S \$5 WASHER

has invented several Washers, which have acquired great popularity; but he regards his

\$5 WASHER

as the best of all, and believes that it will have a popularity far exceeding that of any other Washer yet offered to the public.

It certainly bids fair to be brought into as general requisition as the wash tub, and to be indispensable in every household.

Thirteen reasons why everybody should have

LASH'S \$5 WASHER.

1. It is the best.
2. It is the cheapest.
3. It is not liable to get out of order.
4. It does not give any annoyance from leakage.
5. It is durable.
6. It does its work thoroughly.
7. It does not injure the clothes.
8. It is easily worked.
9. It will wash in one-fourth the time required by hand.
10. No other Washer is offered on such favorable terms.
11. There is no risk in buying it, on the conditions it is offered.
12. It is every way economical—more than paying for itself every three months, in a family of medium size, in the saving of soap, labor, time and clothes.
13. It is sure to please and give entire satisfaction.

Confident that every washer we send out will prove a "Household blessing," and create a demand for others, we are induced to offer them, for a LIMITED TIME, on the following most liberal terms:

For \$5 we will deliver a Washer

FREE OF CHARGE,

at any designated point in the country, where there are facilities for transportation, either by Express or as ordinary freight.

We will also

GUARANTEE ITS SAFE CARRIAGE,

and should it not give satisfaction, will

REFUND THE MONEY

on its return to our House in Philadelphia.

THE LASH WRINGER,

we believe to be the most complete Wringer now in use. It combines all the excellences of other Wringers, and has, in addition, a most valuable improvement just patented, and secured to our Wringer exclusively.

With entire confidence in its merits we offer this Wringer for \$9, and on the same conditions we offer the Washer—DELIVERING IT FREE OF EXPENSE—GUARANTEEING ITS SAFE CARRIAGE, and binding ourselves to REFUND THE MONEY, if it does not give entire satisfaction, on its return to our House in Philadelphia. Never before were such inducements offered the people throughout the country, to possess themselves of so complete a Washer and Wringer.

We prefer selling them together, but will furnish them separately on the receipt of

\$5 FOR THE WASHER,

OR

\$9 FOR THE WRINGER.

Orders will be filled in rotation as received.

TO CLUBS.

Any one sending us \$50 for ten Washers, to be sent to one address, will receive one Washer additional, free of charge; or, any one sending us \$140 for ten Washers and ten Wringers, to be sent to one address, will have one Washer and one Wringer additional sent them free of charge.

TERRITORY.

We will dispose of Territory for the exclusive right to manufacture or sell the Washer or Wringer on very reasonable terms.

Money may be sent us AT OUR RISK, by Draft, Post-Office order, or Registered letter.

J. S. LASH & CO.,

727 Market Street,
PHILADELPHIA, PA.

RARE and BEAUTIFUL FLOWERS, Select Vegetables. B. K. BLISS, Importer and Dealer in Gar- den, Field and Flower Seeds,

Would invite attention to his large and well selected assortment of the above, comprising the newest and most approved varieties, both of European and Home Productions, the quality of which cannot be surpassed. For a list of which, see his

Illustrated Seed Catalogue and Guide to the Flower and Kitchen Garden.

THE THIRTEENTH ANNUAL EDITION, enlarged and improved, contains 124 pages of closely printed matter, *Beautifully Illustrated* with 100 engravings, also a splendid frontispiece of a group of recent novelties and a descriptive list of Two THOUSAND VARIETIES OF GARDEN AND FLOWER SEEDS, embracing all the *new varieties* worthy of cultivation introduced the past season—with explicit directions for their culture—also a list of ONE HUNDRED and TWENTY-FIVE VARIETIES OF FRENCH HYBRID GLADIOLUS, including the leading novelties of the past season, with many other SUMMER FLOWERING BULBS—consisting of AMARYLLIS, TUNEROS, TIGRIDIAS—LILIES in great variety, etc. To which is added a list of the choicest varieties of GRAPES, STRAWBERRIES, RASPBERRIES, and other SMALL FRUITS, Bedding Plants, etc., cultivated at his gardens, with much other useful information upon the subject of gardening generally, which will be found useful to all engaged in the delightful occupation of gardening. A copy of the Catalogue will be mailed to all applicants enclosing TWENTY-FIVE CENTS. Our regular customers supplied without charge. Address

B. K. BLISS,
Drawer No. 11, P. O. Springfield, Mass.

B. K. BLISS, Springfield, Mass.

PRIZE CUCUMBERS FOR FORCING.

General Grant.—A new and superb variety either for exhibition or the table, perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past summer averaging 24 to 30 inches in length. It succeeds well also in the open ground. Packets containing 10 Seeds, 25 cents. Also the following English and German varieties, at 25 cents per packet: Ayre's Perpetual Black Spine, Cuttall's Black Spine; Ipswich Standard; Weedon's Symmetry; Victory of Bath; Giant of Arnstadt; Roman Emperor; Minster Abbey; Lord Kenyon's Favorite; Ne Plus Ultra; Carter's Champion; Colossal Hatch. Either of the above varieties will be mailed to applicants on receipt of price affixed. Address B. K. BLISS, Springfield, Mass.

CHOICE VARIETIES of the TOMATO.

The following varieties of this valuable esculent will be mailed to applicants upon receipt of the price affixed:

Maupay's Superior.—Fruit of a beautiful deep red color, round, slightly flattened, without crease or wrinkle; flesh almost as solid as beef steak, delicious flavor, average weight, 9 to 12 ounces each, packet, 25 cents.

Tilden's New Seedling.—A new and truly valuable variety, oval shaped, the color a brilliant scarlet, skin smooth, glossy, and rarely wrinkled, very productive, an excellent market variety, packet, 15 cents.

Tilden's Harrison's Improved. packet, 25 cents.

Extra Early York, the earliest variety, very prolific, of good size, and fine quality, packet, 15 cents.

The Cook's Favorite.—Fruit of medium size, roundish or oval, smooth, of a rich deep color, fine flavor, very solid and prolific, an excellent market variety, pkt. 15c.

Lester's Perfected. fruit of large size, pinkish red, remarkably solid and of fine flavor, packet, 10 cents.

Mammoth Chihuahua, often weighs 2 and 3 lbs. 25c.

New Eret French, or Tree Tomato, grows upright like a bush, fruit solid and of fine quality, very ornamental, fine for pot culture, packet, 10 cents.

Also, the following varieties at 10 cents per packet:

Early Apple; Pear Shaped; Yellow Plum; Red and Yellow Cherry; Fejee Island; New White; Large Yellow; Strawberry. One packet each of the 16 varieties, \$2.00.

Address B. K. BLISS, Springfield, Mass.

SEED POTATOES.

New English varieties not before offered in this country.

Patterson's Celebrated Seedlings.

These have acquired a notoriety in England, not surpassed by Goodrich Seedlings of this country. We have selected the following from many varieties received, and tested the past year, and can confidently recommend them:

PATTERSON'S REGENT; SEEDLING ROCK; FORFARSHIRE RED; IRISH BLUE; SCOTCH BLUE; KING OF THE POTATOES; PRINCE OF WALES; SKERRY BLUE; PAT'S BLUE.

A writer in the "London Gardener's Chronicle," after describing his success with the above varieties, closes with the following remarks: "As to the quality of the above varieties, we are in a position to speak from experience, and we can only say that we have never tasted any potatoes equal to them. They contain an extraordinary amount of farinaceous matter, are pure white inside, and almost as solid as bread."

As our stock of the above is very small, we can only offer them in sample packages of **One Pound Each, which will be sent by Mail upon receipt of One Dollar.**

One package each of the nine new varieties will be mailed post-paid upon receipt of *Seven Dollars*.

	Peck.	Bush.	Bbl.
EARLY SEBEC, or Boston Market.	\$0.75	\$2.00	\$5.00

KNOX'S NURSERY AT YOUR DOOR.—See Advertisement "By Mail," page 77.

ALL THE NURSERIES

IN ONE!!!

The cheapest Trees, Plants, Vines, &c., are for sale by
L. L. WHITLOCK, 37 Park Row, New York.

1. It is being proved every day that in all kinds of business, the producer and the salesman are in all respects, distinct in their business, and that the purchaser must sooner or later, pay not only the first cost of the article, but also the cost of selling that article, whether sold direct or by Agent, or on Commission.

2. In my business, the purchaser pays the Commission direct to me, instead of the producer.

3. The producer being at no expense, will, in most cases, send a list of all the stock he has for sale, in this way, it will come into direct competition with all others, of the same kind and quality.

4. Purchasers will find the cheapest trees and greatest variety on my books.

5. Nurserymen will, in this way, be able to sell surplus stock at very low prices, without injuring their own business in the future, or the trade, by advertising in their Catalogues at low rates.

6. Producers' names are not seen on my books, every thing being known by numbers, as a matter of self interest, and a benefit to persons selling stock low.

7. No charge made for advertising in my Catalogues, &c.

8. Persons wishing anything under One Hundred Dollars worth, will be charged the usual retail prices of our best Nurserymen, delivered in this city free of expense.

One Hundred Dollars or over, will be considered a wholesale order, and purchasers given every advantage of buying their trees at the lowest wholesale price, whether they want one or one hundred of a kind.

9. I have been engaged in the Horticultural trade for the past twelve years, and consider my services in selecting trees worth more than I ask, but in addition to this I pay my own expenses, and give the advantage of my complete lists of stock for sale, at less money than one could send a man to select them for him, even if he knew where they could be bought, and then he would be obliged to pay retail price for each article.

Send a stamp for a new Price List out February 15th.

Orders, to secure the best selection, should be received by the 1st of March.

All Nurserymen or producers of Horticultural stock of any kind, are invited to send a full statement of what they want to sell, and cheapest wholesale price.

Best reference given on application. Address
L. L. WHITLOCK, 37 Park Row, New York.

American Gate Company,

THE "THREE WARRANTS."—Please read my advertisement headed "Farmers and Gardeners." **JAMES J. H. GREGORY, Marblehead, Mass.**

NOVELTIES AND SPECIALTIES.

THE NEW MAMMOTH—PRIZE SQUASH.—This is a far superior variety to anything hitherto introduced, surpassing all competitors at the Mass. Horticultural Exhibition, and to which the Silver Medal was awarded, weight 145 lbs., described by Mr. Mehan, in the Gardeners' Monthly, page 318, as perfect monsters in size, 25 cts. per packet.

NEW MAMMOTH RUSSIAN SUN-FLOWER.—This is a new variety, and under ordinary cultivation, the heads grow to the enormous size of 20 inches in diameter, the seeds are large, exhibited at the Mass. Horticultural Exhibition, and highly commended by the Committee. For ornamental purposes, for planting in shrubberies, it is a desirable acquisition; it is said to produce a salad oil of superior quality; to poultry keepers, from its immense productiveness, it is invaluable. 25 cents per packet.

The entire stock of the above is in our possession; for larger quantities, special prices on application.

LANTON'S PROLIFIC LONG PODDED PEA is recommended from its immense productiveness, averaging 11 and 12 fine large peas to a pod—for a second crop of its class there is no equal. \$1.50 per quart.

PEABODY PEA, a very prolific dwarf variety, of the Tom Thumb habit, height 15 inches, good flavor, and very productive. \$1.50 per quart.

CARTER'S FIRST CROP, true, for early sowing. The earliest pea in cultivation, \$1 per quart.

The above varieties are imported direct from Messrs. Carter & Co., London.

NOVELTIES—FLOWER SEEDS.

VISCARIA OCLATA, brilliant magenta, new color for a Viscaria.

WHITELAVIA GLOXINOIDES, a very elegant novelty.

NASTURTIUM TOM THUMB ROSE, color the exact counterpart of the Trencham Rose Geranium.

LUPINUS HYBRIDUS ATROSANGUINEUS, the most showy Lupin ever introduced.

SCHIZANTHUS OCLATUS ATROPURPUREUS—large, handsome bloom—crimson, purple and blackeye.

SCHIZANTHUS GRANDIFLORUS ALBUS—large, pure white bloom, with sulphur eye.

CHRYSANTHEMUM DUNNETTII, new golden flower—as large as a Truffant's Peony Aster, color bright golden yellow.

CLARKIA INTEGRIPETAL, pure white, and very double.

NOMOPHILA MACULATA GRANDIFLORA, the flowers the circumference of a Silver Dollar, very showy.

Our **New Amateur's Guide** is now ready; it contains a beautiful colored plate of the above novelties, 100 Engravings, with descriptions of over 2,500 varieties of Flower and Kitchen Garden Seeds—including all the novelties of the season, with full and explicit directions for cultivation. 150 varieties of the New French Hybrid Gladioli—fully described—mailed free to any address, on receipt of 25 cents.

BULBS FOR SPRING PLANTING.

GLADIOLUS, LILIES, TUBEROSE, TIGRIDIAS, ANEMONE, RANUNCULUS, &c., for description and price, see New Amateur's Guide. **WASHBURN & CO.**

Seed Merchants, Horticultural Hall, Boston, Mass.

VICK'S ILLUSTRATED CATALOGUE of Seeds and

30 Days Earlier.

KEYES' EARLY PROLIFIC TOMATO.

HOVEY & CO.

Have the pleasure of announcing that they have purchased from Mr. Keyes the entire stock of his new Seedling Tomato, the most distinct, remarkable, and valuable variety yet produced, being 31 days EARLIER than any other sort.

It is a very handsome and distinct plant in its whole habit and growth, and ENTIRELY FREE from the disagreeable odor of the common tomato vine. The leaves are large, long, and quite entire—not lobed—and the growth is always compact, vigorous and strong. The tomatoes are of medium size, round, of brilliant color, quite smooth and free from wrinkles, perfectly solid, and of the most excellent flavor. They are borne in large compact clusters, from 15 to 20 in each, and from 7 to 20 clusters on one vine; possessing the peculiar and very valuable quality of ripening up together, so that the larger part of the crop comes to perfection before the Tilden, or any other tomato begins to ripen, when they command the highest price in the market. The main crop is full

30 Days Earlier than Any Tomato.

Its remarkable productiveness has also suggested the appropriate name of

Keyes' Early Prolific.

The seeds have been most carefully selected by Mr. Keyes, and we are enabled to offer it to the public, with the most perfect confidence, that for earliness, productiveness, true form, great solidity and beauty, as well as the general qualities required in a popular market fruit, it will surpass any of the excellent varieties yet offered to the public.

The following testimonial, from C. N. Brackett, the Chairman of the Vegetable Committee of the Mass. Horticultural Society, is given in their Report for 1866, and we offer it as the best evidence of the high value and worth of Mr. Keyes' new seedling:

This new variety was originated by Mr. C. A. Keyes in 1861. It came up in a plot of ground, where several varieties had been grown the preceding year. Not having the appearance or usual smell of the tomato plant, Mr. Keyes transplanted it out of curiosity. The plant produced a cluster of fruit 20 in number, within 12 inches of the root, ripening at least 30 days earlier than any of the several varieties in Mr. Keyes' grounds. This year he tested it with the Tilden, and the leading Knudsen, and found it 20 days earlier than either. Whole clusters of from 10 to 20 in a cluster of the Prolific, were fully ripe, while the Tilden contained but one single specimen on the vine. The fruit of this variety grows in clusters with from 7 to 20 clusters on a vine, and the fruit not over 18 inches from the root. The foliage is very large, some of the leaves measuring 8 inches in length by 6 in breadth, entirely distinct from other varieties. Mr. Keyes exhibited both fruit and foliage of this tomato at the annual exhibition (Sept., 1866), and it is in the opinion of the Committee a new and distinct variety and worthy of trial.

We can only add, that, having cultivated this tomato the past year, and carefully watched the growth and ripening of the fruit, we have found it even more than all Mr. Keyes has stated; and we have secured the seed in consequence of our personal knowledge of its great merits.

Dealers supplied on liberal terms. The seed will be put up in sealed packets, and can only be had genuine and true of our establishment.

Single packets 25 cts. The trade supplied by the 100 or 1000.

Address **HOVEY & CO.,**
Importers and Dealers in Seeds,
53 North Market-st., Boston.

Garden and Flower Seeds

Will be supplied in large quantities at the very lowest wholesale rates, and a new retail catalogue with **Reduced Prices** will be forwarded to all who apply for it.

G. R. GARRETSON, Flushing, N. Y.

Onion Seed and Onion Raising.

I will send, post-paid, true Round Early Yellow Danvers Onion Seed, either from my own raising, grown from the seed carefully selected and grown by the originator of this fine onion himself, at \$2 per lb., with liberal deduction on large quantities. There are two or three varieties in the market sold as Danvers Onion, but mine being grown by the originator himself, and from his stock, I warrant it to be the true sort, and every seed of the past seasons' growth. W. M. Thompson, of Fond du Lac, Wis., writes me, "The seed I bought of you last year was excellent, not a peck of scullions from three pounds of seed."—V. S. Rainey, Esq., Columbia, Tenn., writes me: "As an experiment I ordered from you last spring, some of your Onion Seed. I sowed them in the same piece of ground, under the same culture with seed of my own growing. Yours produced more than double as many as mine."—All purchasers can rely upon my seed being fully up to last year's standard. The Danvers Onion will produce from one-fourth to one-third more per acre than any other variety, and is more saleable, and at a higher price in market. Also Large Red Wethersfield, Early Red Globe (very early, productive and popular), Late Red Globe (new, very productive), every seed warranted of the past seasons' growth, from the very choicest of seed stock, at \$2 per lb., post-paid. My Treatise on "Onion Raising,"—a covered pamphlet of 32 pages, illustrated by 13 engravings, containing full directions for every step in the process—from selecting the ground to marketing the crop, forwarded post-paid, to any address for 50 cents. If any person on perusal of it does not find that he has his money's worth, he may return it and I will refund the money.

Marblehead Mammoth Cabbages!

As some cultivators have an impression that these cabbages cannot be fully matured outside of Marblehead, I invite their attention to the following list of weights to which they have been grown by some of my customers.

H. A. Terry, Crescent City, Iowa, has grown them weighing 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Beacom, C. W., exhibited three cabbages weighing respectively, 40, 42½ and 44 lbs. John W. Deau, St. Michaels, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., has raised them weighing 33 lbs. James H. E. H. Ellis, Kana Green, Ind., has raised them weighing over 30 lbs. A. E. Garrison, Des Moines, Iowa, has raised them weighing 30 lbs. James S. Allen, Union Springs, N. Y., has grown them weighing 30 lbs., when striped of loose leaves. Wm. Lee, Jr., Denver City, Colorado, has grown them weighing 45 and 50 lbs., as a penalty for which the miners of the Mountains call him the "Big Cabbage Man." Collins Eaton, Ogdensburg, N. Y., has raised them weighing 50 lbs. Leonard Ghent, Denver City, Col., raised one, which when trimmed of waste leaves, weighed 46 lbs. P. Sweeney, Loretto, Penn., has grown them weighing 43 lbs. Sam'l B. Ornsbee, Rolling Prairie, Wis., has raised them weighing 53 lbs. M. D. Clark, Elyria, Ohio, has grown them weighing 35 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot which weighed from 50 to 60 lbs. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest Cabbage ever seen in the country." "Had astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled." As the original introducer of the Mammoth Cabbage, I am prepared to supply pure seed in packages containing about 500 seeds, at 25 cents per package, 5 packages for \$1, and larger quantities at a proportionate discount. Catalogue of over 200 varieties containing many new and rare vegetables, sent gratis to any address.

JAMES J. H. GREGORY, Marblehead, Mass.

Farmers and Gardeners!

Many of you have thus far found the purchase of Garden Seed the most unsatisfactory and most vexing of all your investments. Now, if you will stand by me, I propose to change all this, and make a revolution in the seed business by my three warrants.—1st. I will warrant my seed to be what it purports to be in kind and quality: 2d. I will warrant that the money you send for seed shall reach me; and 3d. I will warrant that the seed you order shall reach you.

Thus, you see, I take all the risks on myself. I know that in doing this I shall make some losses, but I have confidence that the good sense of the farmers and gardeners of the United States will stand by me in this new movement, and so far increase my business as to enable me to bear all such losses and continue the business on the "three warrants" basis. Stand by me and I will stand by you! Catalogues sent gratis to all. See the advertisement headed "Gregory's Seed Catalogue."

JAMES J. H. GREGORY,
Marblehead, Mass.

FLOWER SEEDS BY MAIL.—The Subscriber raises about one hundred kinds of Flower Seeds, selected from over one thousand varieties, of the most showy and attractive. He will furnish, neatly put up, any 33 kinds on the list for \$1, and send by mail, with postage pre-paid.

G. R. GARRETTSON, Flushing, N. Y.

Extra Early York Tomato.

After testing fifteen varieties I have found none that will compare favorably with this for family and market purposes. It is very early—grows to a good market size, lays its fruit in large clusters, well open to the sun, and but little vine, and is most remarkably prolific, having yielded the past season at the rate of 1050 bushels per acre. Packages containing over 200 seeds, 15 cents each, or 8 for \$1. Packages of Tilden's New Seedling Tomato (200 seeds), 15 cents; 8 packets for \$1. Catalogue gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

SUGAR TROUGH GOURD SEED.

Having the past season raised a very fine lot of these valuable gourds, I offer fresh pure seed for the spring planting. They averaged this year about 6 gallons each, and I have just measured one holding 8 gallons. They have a very hard shell, and will last for years, and for spring land are superior to any thing I have ever tried, and are good for many household purposes. Send your orders early. Directions will accompany each package. Price 25 cts. per package of 25 seeds. Address **WALDO F. BROWN, Oxford, Butler Co., Ohio.**

SEED POTATOES.

Early Goodrich, Harison, Cuzco, Gleason, Coppermine, Calico, Monitor, Pinkeye-Kustycot, White Peach Blow, Fluke, Union, Holbrook, Early Cottage, Sebce, and other varieties will be mailed, in packages containing 4 pounds of either variety, post-paid to any address, upon receipt of One Dollar. For larger quantities and Circular, Address
REISIG & HEXAMER, New Castle,
Westchester Co., N. Y.

Potatoes, Choice New Varieties, Early and Late.

E. C. ALLEN, West Meriden, Conn., having raised especially for seed, offers for sale by the bbl. four desirable, productive sorts of the BEST GOODRICH SEEDLINGS, first obtained direct from Mr. Goodrich and his successor—viz. **CALLAO, EARLY GOODRICH, Gleason and Calico.** The **CALLAO** is very fine quality, early, white flesh, beautiful and productive. Prices for either sort given on application, stating number of lbs. wanted. Orders promptly filled, avoiding shipments in freezing weather. Potatoes can reach New York in less than one day.

Seed Potatoes by Mail as Heretofore.

STRAWBERRIES.

Agriculturist.—I have a large stock of very fine plants of this magnificent variety, at 50c. per doz., \$3.00 per 100, or \$12.00 per 1000.

Great Rippawm.—This variety took the first prize over all other varieties for the largest berry at the great show of the American Institute. It is wonderfully productive, very large, scarlet, fine flavored, and promises to be one of the best market berries known. Plants, \$2.00 per doz., \$10.00 per 100, or \$90.00 per 1000.

Golden Queen.—A monstrous berry, very handsome, productive and good. (Said by some to be Trollop's Victoria.) With mo it is much more productive than that variety. Plants, \$1.00 per doz., \$5.00 per 100, or \$40.00 per 1000.

Ida.—The most productive strawberry known, literally covering the ground with its fruit. Berry, scarlet, medium size, one of the most profitable for market. Plants, \$1.00 per doz., \$3.00 per 100, or \$20.00 per 1000.

New Jersey Scarlet.—One of the earliest to ripen. Fruit large, scarlet, fine, and very productive, valuable. Plants, 50 cts. per doz., \$2.00 per 100.

Lennig's White.—The best white berry known. Fruit very large, finest flavor, and very productive. Should be in every collection. Plants, \$1.00 per doz., \$3.00 per 100, \$25.00 per 1000.

Mead's Seedling.—This is put down as one of the finest berries in cultivation. Fruit very large and productive. Plants, \$1.00 per doz., \$6.00 per 100.

Jucunda, or Knox's 700.—A very large and beautiful berry. Should be in every collection. Plants, \$1.00 per doz., \$5.00 per 100, \$40.00 per 1000.

White Alpine.—A valuable, very productive white berry, so sweet that it requires no sugar for the table. Plants, \$1.00 per doz., \$3.00 per 100.

Also Wilson, Russell, Buffalo, Austin, Downer's Prolific, French Seedling, Green Prolific, and many others, at low prices. All plants will be delivered in rotation as ordered. Address **WM. S. CARPENTER, 156 Reade-st., New York.**

500,000 Red Cedar Seedlings.

Would you have a wall of LIVING GREEN to shelter your homes from the STORMS OF WINTER, then PLANT the Red Cedar. EARLY orders filled at following low prices. Correspondence solicited. Send stamp for Circular. 4 to 3 inches high, per 1000, \$3.50; 4 to 8 inches, per 10,000, \$50. 8 to 12 " " " " 100, \$10; 20 to 30 inches high, per 100, \$15. Address **JNO. M. HUNTER & CO., Ashley, Washington Co., Ill.**

REBECCA,	\$30 per 100.
ROGERS' HYBRIDS,	\$40 per 100.

In classifying our Vines, we make no *extras*. Our No. 1 plants are the largest and best of our stock, and their average quality is not allowed to be diminished by selecting the largest for retailing as *extras*.

All the Vines thus offered are grown without bottom heat, from well ripened wood, and in good, deep soil, not injured by extra manuring.

For List of other sorts, we refer to our Descriptive Catalogue of Vines. Address

PARSONS & CO., Flushing, N. Y.

GRAPE VINES.

GREAT REDUCTION IN PRICES.

The subscriber offers the balance of his stock of vines at a bargain, and persons intending to plant, will do well to examine his prices and stock before purchasing elsewhere. The plants are unsurpassed by any in market, and are all warranted true to name. Send your orders immediately, as we have but a small supply left.

Concord No. 1, 25c. each, \$2 per doz., \$6 per 50, \$10 per 100. Concord No. 2, 20c. each, \$1.75 per doz., \$5 per 50, \$8 per 100, \$75 per 1000.

Diana, Delaware, No. 1, 50c. each, \$1 p. doz., \$12 p. 50, \$20 p. 100. Hartford P., No. 2, 35c. each, \$3 p. doz., \$9 p. 50, \$15 p. 100. Rebecca, Iona, No. 1, \$1 each, \$10 per doz., \$35 per 50, \$60 per 100.

Iona, No. 2, 75c. each, \$7.50 per doz., \$25 per 50, \$40 per 100. Rogers' Hybrids, No. 1, 4, 13 and 19, Creveling, etc., at 75c. each, \$6 per doz., \$40 per 100.

Besides the above we offer a few *Extra* Concord and Hartford Prolific vines as strong as ordinary first-class 2-year olds. Extra Concord, 35c. each, \$3 per doz., \$9 per 50, \$15 per 100, \$125 per 1000.

Extra Hartford, 60c. each, \$6 per doz., \$18 per 50, \$30 per 100. Extra Diana, 60c. each, \$6 per doz., \$18 per 50, \$30 per 100.

We would call particular attention to these *Extra* vines. We consider them decidedly superior to an untransplanted two year old vine, and equal to any good first-class two year old transplanted. Terms invariably Cash. When ordered C. O. D. collection and return charges at cost of purchaser. To those who send their orders early, accompanied by Draft or P. O. Money Order on New York, we will make no *Extra* charge for packing. Address

Peas, Daniel O'Rourke, and Hairs.
Dwarf Mammoth.

\$2.00.

Insure promptness and certainty by early orders.

SILVERS'

PATENT EXCELSIOR BROOM.

5000 Agents Wanted.

We Charge Nothing for the Right to Sell it.

DESCRIPTION.

A single brush or stalk is represented by A; B represents two brushes with their stems bent and passed through the malleable iron loop C; these brushes are arranged alternately until the loop is filled, as represented by D; the seamless metallic head E made of polished sheet brass or German silver is then passed over the filled loop, after which it is firmly screwed into the ferruled handle, and thus held in a compact form as represented by the cut.

This celebrated broom has now been before the public for one year, and has proved itself to be as represented—the cheapest, simplest, most beautiful, durable and ELASTIC in the United States. It has been awarded the first premium wherever exhibited, including the New York, Ohio, and Kentucky State Fairs of 1866, and is highly recommended by the leading journals, and scientific men of the country, as the following unsolicited notices of the press and testimonials will show.

[From the Scientific American.]

SILVERS' METHOD OF CONSTRUCTING A BROOM MAKES A MUCH BETTER ARTICLE THAN THE OLD-FASHIONED ONE, FOR THE SHANK IS STIFF AND HELD FAST, THUS OBTAINING A SPRING OR ELASTICITY WHICH IS VALUED BY HOUSEKEEPERS.

[From the American Agriculturist, after 3 Month's Test.]

SILVERS' PATENT BROOM.—This is a novelty, certainly. By means of a cap and screw, the brush can be removed at any time. We have no broom corn at hand to test the removal of the old brush and the putting in of new, but we do not see why it can not be readily done by any one, and farmers thus raise a little plot of broom corn and make their own brooms, after buying a patent handle. The one we are using has a superior elasticity.

[From the Boston Cultivator.]

Everybody who sees it says it is perfection, and that it will soon supersede all others. Let every farmer plant a small piece of broom corn, grow the brush and make his own brooms hereafter, as all can do.

[From a Report of the American Institute "Farmers' Club," in the New York Weekly Tribune.]

Silvers' Patent Broom was exhibited. An iron screw-bolt, some six inches long, has an open head. The stalks of the brush are scarfed off and put in this loop, alternately from each side, until there is enough for a broom. Then a metallic cap is slipped down over the brush, to hold it in proper shape and keep it firm in the loop. The handle is then screwed on, and the broom is finished. When the broom is worn out, unscrew, shake out the old brush and insert new. A child ten years old can make a new broom in ten minutes. These new contrivances will tempt farmers to grow their own broom corn.

EMPORIUM OF FASHION, 473 Broadway,

New York, June, 1866.

MR. SILVERS: The beauty and practical utility of your "Excelsior Broom Head" are too SELF-EVIDENT to require commendation. I cordially indorse all you claim for it.

MME. DEMOREST.

[From Prof. O. S. Fowler, the Celebrated Phrenologist.]

DEAR SIR: In my judgment your broom embodies the very best sweeping instrument extant. You will save dollars to every cleanly family, and thousands per annum to our country by its introduction—in doing which you are public benefactors.

[From E. P. Cooley, the Noted Corn Broom and Brush Manufacturer, 204 Pearl Street, New York.]

Silvers' is the only Patent Broom I have ever seen that is of any account. This patent, for simplicity, durability, beauty, elasticity and cheapness, seems perfection itself.

[From Miles Greenwood & Co., Cincinnati.]

Having examined Silvers' Patent Excelsior Broom Head, we have no hesitation in recommending it as being one of the most perfect we have seen.

THE ELASTICITY of this Broom is so great that it will wear twice as long, sweep with half the effort, AND DOES NOT WEAR OUT THE CARPET one fourth as fast as the ordinary broom. It is fast becoming a universal favorite, AND IS THE ONLY PATENT BROOM EQUALLY ADAPTED TO CITY AND COUNTRY, as the filled loops D will soon be supplied by all dealers at two-thirds the cost of the common broom.

TO AGENTS.—We want an Agent in every County in the United States. We charge nothing for the right to sell, but let it stand on its own merits. All of our Agents are doing well. Mr. Geo. A. Wetherell sold 1100 in Athens Co., Ohio, and expects to sell as many more in Morgan Co. William Marvin made \$24 in the first day's canvass in Ulster Co., N. Y. A. Goodale, Agent for Orange Co., N. Y., writes that he expects it will supersede all others in his County, as the ladies say they will use no other when the "SILVERS" is to be procured.

WOOD & MANN STEAM ENGINE CO'S CELEBRATED PORTABLE AND STATIONARY STEAM ENGINES AND BOILERS.

FROM 4 TO 35 HORSE POWER. ALSO PORTABLE SAW MILLS.

We have the oldest, largest and most complete works in the United States, devoted exclusively to the manufacture of Portable Engines and Saw Mills, which, for simplicity, compactness, power and economy of fuel, are conceded by experts, to be superior to any ever offered to the public.

The great amount of boiler room, fire surface and cylinder area, which we give to the rated horse power, make our Engines the most powerful and cheapest in use; and they are adapted to every purpose where power is required.

All sizes constantly on hand, or furnished on short notice. Descriptive circulars, with price list, sent on application.

WOOD & MANN STEAM ENGINE CO.,
Utica, N. Y.

Branch Office, 96 Maiden Lane, New York City.

FLAX.

MALLOREY & SANFORD'S IMPROVED FLAX AND HEMP BRAKES,

As now made, are the strongest and best ever used. They occupy about 5 feet square, weigh about 1,000 lbs., require one man and a boy, and one to two horse power to work them; breaks from 2,000 to 3,000 lbs. Flax straw in 10 hours, taking out 65 to 75 per cent. of the woody matter. This machine will save 15 lbs. to the ton more than any other machine in the world. It will break tangled straw as well as straight. We have also an entirely new tow shaker and picker; works perfectly and does its work quicker and better than any other machine, and prepares the stock for rope. Also a new tow corner, which cleans and straightens the tow, free from shive, rapidly making it fine and straight. Send for circular or see machines in operation at 93 William-st., New York. Address

JOHN W. QUINCY, Treasurer,
No. 93 William-st., New York.

A. N. WOOD & CO., EATON, MADISON CO., N. Y.,

Continue to manufacture their Improved

PORTABLE ENGINES,

For Farm and Mechanical purposes. They are particularly adapted to driving Threshing Machines, Circular Saws, Mills of all kinds, Printing Presses, Wood or Iron Lathes, Machinery in Cabinet or Wagon Shops, Boring Artesian Wells, Pumping Water, Corn Shellers, &c., &c.

We warrant our Engines to be what we represent them, and to give unqualified satisfaction in all respects.

FAMILY KNITTING MACHINES!!

Lamb's Improved Family Knitting Machine

is Needed by Every Family.

When a pair of Stockings of any size can be knit with this machine in twenty minutes, it is folly to knit by hand. Making a variety of stitches, it produces to perfection, Shawls, Hoods, Tippets, Mittens, Afghans, Sacks, Sontags, Undersleeves, Neck Ties, Tidies, Hosiery of all kinds, and numerous other useful articles.

This machine weighs only 20 pounds, and knits readily 10,000 stitches a minute, the stocking stitch being precisely like that knit by hand. A woman can easily earn with it \$2.00 per day. Agents wanted.

Send for a Circular, enclosing stamp, to the
Lamb Knitting Machine Co.,
Springfield, Mass.

THE UNIVERSAL CLOTHES WRINGER

AND

DOTY'S CLOTHES WASHER.

THE UNIVERSAL WRINGER was awarded the First Premium by the unanimous vote of the Committee of the GREAT NEW ENGLAND FAIR of 1866, after the most scrutinizing trial of the various machines of numerous competitors.

It was pronounced superior to all others at the WORLD'S FAIR IN LONDON, 1862.

Took the First Premium at the last two Great Fairs of the AMERICAN INSTITUTE in New York City, 1863 and 1865. At each of the following State Fairs it also received the

FIRST PREMIUM:

NEW YORK.....	1862.....	1863.....
VERMONT.....	1863.....	1865.....
NEW HAMPSHIRE.....	1863.....	1866.....
PENNSYLVANIA.....	1863.....	1864.....
OHIO.....	1863.....	1865.....
MICHIGAN.....	1864.....	1866.....
INDIANA.....	1863.....	1864.....
ILLINOIS.....	1863.....	1864.....
IOWA.....	1863.....	1864.....
WISCONSIN.....	1864.....	1865.....
MINNESOTA.....	1864.....	1866.....
MISSOURI.....	1864.....	1866.....
KENTUCKY.....	1865.....	1866.....
CONN. RIVER VALLEY FAIR.....	1864.....	1864.....
CHAMPLAIN VALLEY FAIR.....	1864.....	1864.....
MECHANICS' INSTITUTE, Boston.....	1863.....	1863.....

And at most of the County and Institute Fairs throughout the country where it was exhibited.

The manufacturers WARRANT it FAR superior to all others.

There have been more than half a million UNIVERSAL CLOTHES WRINGERS sold, which amounts to more than those sold by all other makers. We warrant them to be all they are represented to be. They are so well made and durable as to seldom need repairing, and with ordinary care will last many years. Those received for repairs will not average more than one in every two hundred sold. THE UNIVERSAL CLOTHES WRINGER has given really universal satisfaction. It wrings clothes almost dry without injury to the most delicate garments.

Beware of Persons claiming to sell "an improvement on the Universal Wringer." The genuine bear the imprint: R. C. Browning, Agent, 32 Cortlandt-st., N. Y.

In selling the UNIVERSAL WRINGER, we find a large demand for a good Washing Machine, and knowing

DOTY'S WASHING MACHINE

to be the best, we secured the patent, and now offer it to the public, knowing that it will give satisfaction wherever used.

DOTY'S CLOTHES WASHER was awarded the FIRST PREMIUM at the GREAT NEW ENGLAND FAIR of 1866, after the most thorough trial with numerous competitors. It has taken the

FIRST PREMIUMS

At the State Fairs of
NEW YORK, PENNSYLVANIA, VERMONT,
MICHIGAN, WISCONSIN, and IOWA.

Also, at the last

GREAT FAIR OF THE AMERICAN INSTITUTE.

A supply of the Wringers and Washers are always kept on hand in Chicago, Cincinnati, Cleveland, Louisville and St. Louis, boxed ready for shipment, at about New York prices.

Circulars, giving wholesale and retail prices, sent free. Large profits are made selling these Machines. Exclusive right of sale given, with no charge for the patent right.

On receipt of the price from places where no one is selling, we will send one Washer and one Wringer, either or both, free of freight charges. Family Size Washer, \$14; No. 1 1/2 Wringer, \$10; No. 2 Wringer, \$8.50.

A Monthly Magazine, for Mothers and the Household.
With nothing light or trashy, it is practical in purpose, sub-
stantial in matter, attractive in style. To aid Mothers in
their noble, but difficult work, and to make the family healthy,
happy, useful, and good, is the object of the JOURNAL.
Price \$1 50 per year. Five copies, \$7. Single Numbers, 50
cents. Send by mail, directed to "MOTHERS' JOUR-
NAL," 500 Broadway, New York.

(CONTINUED FROM PAGE 80, WHICH SEE.)

wine. * * * No! the Concord won't make wine, even in
the West. You may set that down as a sure thing."

EXTRACT FROM WILLIAM GRIFFITH, LATE PRESIDENT OF
LAKE-SHORE WINE CO.

Northeast, Jan. 10, 1867.

"Dr. C. GRANT.—While sending my order for another ten
thousand No. 1 Iona vines, I cannot forbear offering a few
remarks. Last year, after (as I thought) becoming thor-
oughly acquainted with the Iona both for fruit and for wine,
I felt constrained to say: "If C. W. Grant had gotten it up
to order, I know not in what respect he could have improved
it." But we lost a thousand fine vines by the freezing and
thawing of our open rainy winter. Did that change any
opinion of the Iona? Not at all! Why should it? All other
kinds that received the same treatment in planting, Concord
included, shared the same fate, while the Iona under the
treatment that you recommend, passed unscathed. Between
bad treatment and multitudes of poor plants, and other
difficulties that should not attach to it, the Iona has a heavy
weight not its own to carry. An extended tour of observa-
tion has added great weight of confirmation to my own
experience. * * * I shall take much pleasure in dis-
seminating knowledge of it. It needs but to be thoroughly
known to take precedence of all other kinds for all pur-
poses. In the amount of enjoyment it can yield for fruit or
wine, there is none to compete with it.

In the next number I shall give some interesting facts
concerning the Greeley prizes, showing that no "Greeley
prize" has ever been awarded to any except the Iona Grape,
or could be. See Downing & Mead's report, also pamphlet,
for which send stamp.

IONA, Jan. 10, 1867.

(Business Notices \$2.50 per Agate Line of Space.)

THE GREAT AMERICAN TEA COMPANY ALWAYS A WHOLESALE ESTABLISHMENT.

We have many inquiries (10 to 20 letters a day) asking what discount we make to the Trade from our prices as published in the *PRICE LIST*. These are our *lowest wholesale prices*. We consider ourselves only a Wholesale Corporation, and we have but *one price*.

The way in which we came to break packages at all, was that during the high prices of Teas we furnished parties with packages as small as five pounds. Our fame spread far and wide; and parties with small means thought it very hard to be compelled to pay, elsewhere, about a *dollar* per pound more than we were selling the same goods for, simply because they could not afford to buy five pounds of us at one time. Therefore, in order to lighten these burdens, we consented to supply their wants in quantities as small as one pound at the wholesale prices.

Parties of small means wishing for goods to sell, can have their orders put up in small packages to suit their trade, but we cannot make any reduction in price, as our profits for the last six years have not averaged more than *two cents per pound*.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for *all the profit he can get*.

When you have added to these *eight* profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

The Company have selected the following kinds from their Stock, which they recommend to meet the wants of Clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the List of prices will show.

All goods sold are warranted to give satisfaction.

From the *New York Tribune*.

A SUCCESSFUL ENTERPRISE.—THE GREAT AMERICAN TEA COMPANY commenced business in 1860 in this city. They now occupy six large stores and employ about 250 persons, their sales of Tea and Coffee amounting to \$90,000 per week. Their success shows what ability and enterprise will accomplish. It is simple enough. Their sales being large, they are of course in a position to sell their goods for a smaller profit on each pound. In their advertisements in the *Tribune*, from time to time, they fully explain their system of doing business, and from the many letters received from all parts of the country, we judge that their customers are well satisfied.

PRICE LIST:

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

MIXED, 70c., 80c., 90c., best \$1 per pound.

JAPAN, \$1, \$1.10, best \$1.25 per pound.

OOLONG (Black), 70c., 80c., 90c., best \$1 per pound.

IMPERIAL (Green), best \$1.25 per pound.

ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GUNPOWDER (Gunpowder), \$1.25, best \$1.50 per lb.

IONA AND ISRAELLA.

CONTINUED FROM JANUARY NO., PAGE 35.

If it is true that persons who have eaten no better grapes than Concord, can have no idea of *good* grapes, still further are those from any just idea of the goodness of real wine, or of what are the principal constituents of its excellence who have only drank the syrups made from the juice of that or any of its class. Several years since I felt called upon to make the declaration that Concord *had not* made wine, and could not make wine. This stands unshaken at the present moment by anything that the Concord has produced in *any* quarter. Poor vinegar and various syrups and confections have been made from Concord grapes, but no *wine*.

The excellence of wine *must* exist in the grape, and only those kinds which possess the requisite characteristic qualities can make *wine*. Those qualities, and in proper proportion, have never been found to exist in the Concord. It is unnecessary to note here its nauseating odor which is even more prominent and offensive in the wine than in the grapes.

I have not space allowed me here at present to complete this Essay, but quite enough to write a full history of the Concord grape to be read two years hence. "The more it was known, the less it was esteemed. Numerous fortunes were made by the propagators of it, and more pecuniary interest centered in it in this respect, than in all other kinds combined," which "The most capable and impartial Committee that ever sat in judgment upon grapes, made their best effort to conserve." The Committee was made thus *impartial* and *capable* by weeding out of it Charles Downing and Peter B. Mead, who were manifestly unsuited to the emergency.

A few Objections against the IONA briefly noted:

"It was destroyed last winter in large numbers, by being thrown out and frozen." This is sadly true; and all other kinds, Concord and Delaware included, by their side, suffered just the same, that were subjected to the same treatment, while all, treated according to the directions of my Manual, withstood without injury. Mr. Wm. Griffith, (late President of the Lake Shore Wine Co.,) who was the largest sufferer by the unprecedented winter, writes: "The loss was not from want of hardness in the kinds, and I have lost no jot of faith in the Iona. The ten thousand I had from you last season made a very handsome, even growth, and are now having a healthful sleep preparatory to a vigorous start next spring. I hereby send an order for another ten thousand vines, to be sent in early spring."

Mr. Mottier was also a large loser, but he has given a public statement, that *any* kind, under like circumstances, must have failed equally. (For full account, see Pamphlet.) His recent order, greatly enlarged over former years, shows, in connection with his notes, the present state of his mind on the subject.

It has been alleged, as a great fault, that it did not receive the award of the Greeley prize; but I think that has been clearly shown to be a grievous *misfortune* rather, not *chiefly* to the grape—far otherwise.

It is charged that although unqualifiedly best for the table, it may not be equally excellent for wine: I offer the following from the Secretary and Manager of the Pleasant Valley Wine Co., who is *capable* certainly, but perhaps neither "impartial nor disinterested":

PLEASANT VALLEY, Jan., 1867.

DR. C. W. GRANT,

I have tried the Iona wine by the severest tests that could be furnished, and all of the trials have been very satisfactory.

Taking the best Catawba wine that has been made as "very good," I should place Delaware next above it in rank; Diana, for some qualities, next above that, and Iona above all.

Placing Iona by the side of the finest wines of Germany, that are not excelled in the world, it does not suffer in comparison in any respect, while it has some important characteristics entirely its own that, in my estimation, place it above that of all other grapes with which I am acquainted. I intend to plant largely of it, and of that only, and from my own experience and extended observation, confidently recommend the same to my friends.

Enclosed find order for 10,000 Iona vines No. 1, Vineyard Class.

C. D. CHAMPLIN, Secretary,
Pleasant Valley Wine Co.

An extract from Dr. Charles J. May, Hancock Co., Ill.: "I propose to plant Iona, and only that hereafter, although Delaware does admirably here, and makes excellent wine—*real* wine, which the Concord never has done. It is true, immense yields of the Concord are recorded, both in this vicinity and in Missouri. But did you ever believe that here in the West, the Concord does make a good wine? Did you for one moment believe that our soil and climate had so changed its nature? I ask you this, because for a time I thought it might be possible. I could not bring myself to believe it, but thought it possible. Well, we have grown Concord grapes in their highest perfection; we have made wine from selected berries, using only the ripest and most perfect; we have made the wine in our best arched cellars, and have used every thing known to the present age of wine-making, to make it perfect, except sugar, and the result is, wine that will make a pig squeal. I speak now of pure

THE BALD EAGLE—(*Haliaeetus leucocephalus*).—Drawn and Engraved for the American Agriculturist.

The Bald or White Headed Eagle, is, without dispute, one of the most striking and beautiful of the eagles, from his dark heavy plumage, white head and tail. There is nothing particularly noble about the bird, and many have considered it unfortunate that he was made the national emblem. Bald Eagles are occasionally seen in all the States of the Union. In winter they are frequently quite common along the coast. We have seen them in groups along the Sound coast of

Connecticut, so tired as to be easily approached, probably having been blown by some storm far out to sea, and having made the coast at that point. This eagle lives upon fish, birds, and such animals as it can catch and overpower. Often it lets the Fish Hawk catch the fish, and then pursues the hawk, thus impeded in its flight, forces it to let its prey fall, when, adroitly turning, the eagle robber catches it in the air. In certain feats of flight, it surpasses all other

birds—soaring in circles out of sight, without perceptibly moving its wings; closing its wings and dropping perpendicularly from immense heights, and with the sound of a rushing wind.

The length of these birds is about 35 to 40 inches, and the spread of the wings about seven feet. The plumage of the body and wings is brownish black, that of the thickly feathered head and the tail being white, in adult birds only; the feet are yellow, and the beak a paler yellow

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MARCH, 1867.

Good or ill success in the farming operations of the season depend very much upon this month—much upon the weather of this most variable and uncertain of all changeable periods, and more upon the farmer's own ability, promptness and diligence to take advantage of events. There are many things in the future that we may calculate upon with great certainty, and, planning to take advantage of them, be able to turn the uncertainties to our good also. We shall have in March 31 days and nights—many frosty nights and cold days; some storms and rainy days, cold, clear, drying northwest winds lapping up the water over the fields and drying the fall-plowed furrows. We shall have sunshine too, warming the ground and breaking the frost fetters. The snow on the hills will melt and the streams will swell, sweeping off fences and bridges, perhaps. The roads will be broken up, traveling hindered, and mails detained, going to mill with grain and to town for needed articles, will be a labor to be undertaken only by the pressure of necessity. Poultry will be laying, and elueking or setting. Foxes, minks and other vermin will be prowling about. Calves, lambs and pigs will be coming into the world; stock will be hungry, and we hope, satisfied also. There is work to be done and time to do it in.

Hints About Work.

Plans for the Month.—We shall all accomplish double the work, if it be well laid out, and it will be better done.—"What do we want done?"—"How and when shall we do it?"—Let us make a list of the things we want to do most, and then see how fast we can cancel them off as done.

Hired Labor.—If a farmer does not hire any labor now, let it be his aim to employ as many men as he profitably can, and make arrangements to do so as soon as he can. Hired men are often very disagreeable associates, and the worst companions for one's children, but this need not be; lookout the profits of the farm rather than have a vicious, bad fellow about, though his work be never so needed. If we do our part to make the men comfortable and do them good, few will ill reward it.

Buildings.—The winds will find out any insecure weather boards and shingles, and play mischief with the exposed hay stacks and with thatched roofs. Have nails and hammer at hand; stop leaks; see that door and shutter fastenings are secure, and that board fences, posts of which are loosened by the frost, are not prostrated by the wind.

Cellars.—Over-haul the roots, put them in bins or boxes, or make fresh heaps of sound ones only; clean out cellars, air and white wash; stop rat-holes with coal tar and mortar, said to be rat-proof.

Drainage.—While the frost is coming out of the ground, and the soil of plowed side-hills is liable to slide, look to it that no water finds its way upon such spots, or great damage may ensue. Open surface drains with the hoe, pick, or mattock, so that surface water may flow off upon sward ground or where it will not wash off the soil. Such water from cart paths, roads, or plowed fields brings with it, upon the meadows and pastures, a wealth of enrichment, not to be lost. The advantage of

Irrigation can hardly be over-estimated. If a brook can be turned to flow at will (your will) over a piece of meadow, even in the crudest and simplest way, by all means try it, and then profit by experience to extend the system, or rather, profit by the experience of others and use the best system.

Grain Fields are especially liable to injury from washing, and surface drains on them should be kept free. Top-dressings of plaster, bonedust, superphosphate, guano, fine fowl-house compost, home-made poudrette and such things are applied with great advantage at this season.

Clover and Grass Seed may be sown on winter grain; best on a still day, after a light snow, which may have fallen on frost-cracked and thawing ground.

Plowing should be done as soon as the ground is dry enough, but not one hour before; better wait a week or two than compact the soil, so that it will dry into hard clods, which will last for months.

Peas may be sown as soon as the ground is dry enough to plow well, often in March, in this latitude; they may be sown broad east, alone or mixed with oats, or in drills. On warm, early spots the drill culture may be recommended. The soil should be in good order for a heavy crop of oats, and deeply plowed, then plow shallow (4-inch) furrows, and in every third furrow scatter the peas, throwing in twelve to fifteen to the running foot. If you have time these may be picked for marketing green, and if not, the crop will be ripe enough to eat and cure, and leave the ground for summer plowing, and wheat, cabbages or turnips may follow.

Seeds.—Procure, and test the vitality of all seeds.

Horses need very thorough grooming, and the feet and legs should be washed and kept clean, long fetlocks trimmed off, and any redness or cracking of the skin or heels treated with pine tar and grease, or an ointment of lard and turpentine. These applications are either of them very good for chafed shoulders, sprains, or harness galls. Blanket carefully if exposed to the wind or cold when warm.

Working Oxen.—Protect from storms; feed well; use the card freely; impose hard labor gradually; have well fitting yokes, and if their necks become tender, give a day or two of rest, and grease the spot, rubbing the grease well in. A wet towel on the neck, with a piece of blanket bound over it, kept on one night, and the neck greased well the next day, will, it is said, cure a very tender neck between Saturday night and Monday morning.

Cows.—Give good care, personal attention, and roomy box stalls to cows about to calve. They may need assistance, and suffer much or even die for lack of it. If milk is worth much the

Calves should be removed from their dams at once, and brought up on skimmed milk gruel. The cow misses the calf least if she never even licks it; but we would rather she should worry more, when she loses her calf after a day or two, than deprive her of the satisfaction of loving and licking it awhile.

Lice, from many causes, show themselves, especially among ill-kept stock, more in spring than at any other season. They cannot stand regular ear-ding and brushing, but if very bad, should be treated to an application of alum water, with a good rubbing, and subsequent ear-ding and greasing, on the same day of two or three weeks in succession. Mercurial ointment (unguentum), is sure death to the lice, and to the ox too, if too much be used. A lump as big as a hazelnut, rubbed up with a table-spoonful or more of lard is enough for an ox. Rub it in behind the horns and along the spine, then spread it by thoroughly rubbing with straw. Keep the animal from exposure to wet or storms.

Sheep.—Mutton sheep may be yearning this month. Separate ewes and give them warm quarters, with a few extra roots or other feed.

Hogs.—Isolate breeding sows, give warm pens and treatment as before directed. Keep others at work in the manure, giving sods, etc., to be worked over.

Poultry.—Give chance to run and scratch and dust themselves. Save eggs for setting, and make sure of a few clutches of early chickens for winter layers.

Field work of a miscellaneous kind there will be no lack of. Get out and cart off stones loosened by the frost. Reset fence posts, or walls, where needed, with spuds, spades, and hoes; clear out the bull-thistles, docks, and all biennial weeds that show themselves. Remove also any rubbish from fields and fence rows. Open ditches and mend roads.

Manure.—Haul out while the ground is frozen or after it is settled. Spread at once, whether for plowing under or for top dressing, but put it on no spots where flowing surface water will wash it away. It is best to plow it under at once, unless it be well made compost, which will bear weathering.

Work in the Horticultural Departments.

The next worst thing to being too late, is being too early. As soon as the snows disappear, the enthusiastic cultivator is desirous of beginning out of door operations. He has read and planned all winter, and now wishes to execute. How tedious it is to wait until the ground is in "working order," and ready to receive trees, vines, or seeds. Yet we must wait, and the time required for soil to be fit to work will depend upon its natural or artificial drainage. Let this springs' experience of those who have to wait for the waters to subside, emphasize our often repeated injunction, to drain the orchard, vineyard, or kitchen garden, if the soil be at all retentive. Look over the notes of the two preceeding months and see if some preparatory work is not there suggested which is still undone, and do not delay sending orders to nurserymen and seedmen.

Orchard and Nursery.

Many trees will be purchased this month, and we would give a word of caution against the common practice of ordering large trees. A small, well grown tree with an abundance of small roots, is greatly to be preferred to a tall, much branched one, with its large roots chopped off in the digging. Some of the best western orchardists prefer trees one year from the bud or graft, to any other.

Heel-in at once trees that arrive before you are ready to plant; bury their roots well in a sandy place, and they may remain for weeks without injury.

Plant whenever the soil is ready, taking care to first trim mutilated roots, and shorten back the top; planting will generally be left until next month.

Insects are always to be looked after. See notes for January and the article on the canker-worm, on page 102. If small cottony spots, looking like mould, are seen, they are the far too common Woolly-Aphis, and for this the best remedy is the

Soft Soap Wash, which may be applied with advantage, even if no insects are visible. Make as strong as it will work; it removes not only insects and their eggs, but parasitic plants and loose bark as well.

Girdled trees must be attended to as soon as the injury is discovered. Where the girdling is complete, the tree may often be saved by connecting the bark above and below the wound, by means of cions whittled to a thin chamfer at each end, and inserted beneath the bark. Cover with wax or grafting clay, or simply bandage securely, and put a mound of earth around the tree large enough to cover the wounded portion.

Grafting should not be done too soon. It is time enough when the swelling of the buds shows that vegetation is active. Continue to secure cions; and preserve as heretofore directed. Cut back

Stocks budded last year, if the bud is sound.

Fruit Garden.

Trees in this department will need the care indicated under Orchard.

Grape vines that were laid down may be uncovered as soon as severe weather is over. In planting new vines, cut them back to two or three buds, provided the nurseryman has not done it before sending them. In any system of training, a single cane is all that should be grown the first year.

Cuttings of currant, grape, etc., are to be set out as soon as the soil is ready. It cannot be too often repeated, that much of the success of this kind of propagation, depends upon pressing the soil firmly around the lower end of the cuttings.

Currants.—Set out plants early. The Versailles is the best red, and the White Grape the best white. There are many varieties, only such in name. Plant

Gooseberries—only the American sorts are to be commended for general cultivation, and among these the Houghton is one of the most reliable. Some of the English sorts will do for amateurs to pet.

Strawberries should have the beds all ready for them, and the plants be set as early as they can be

had. The Wilson is the variety still the most generally reliable, though there are many better sorts that succeed in favorable situations

Blackberries.—The sooner they are planted the better. Kittatinny and Wilson's Early are among the newer kinds, and the New Rochelle is now so well known as to need no description.

Raspberries, also need early planting, as, like blackberries, the shoots push early, and are liable to be broken if they have made much growth. The Philadelphia and the Clark are two of the most promising new sorts. For the many older varieties, of these and other plants, consult the catalogues.

Kitchen Garden.

Except where glass, as hot-beds or cold-frames, is in use, the work in this latitude is still mainly preparatory, and but little is gained, as a general thing, by commencing gardening operations before next month. In dry or well drained soils,

Plowing may be done, but only when their condition will admit of thorough pulverization. Recollect that ground for a garden can hardly be too thoroughly worked or too highly enriched.

Manure, especially if well rotted, should be applied with a liberal hand; on stiff soils, coarser manure may be used, and on sandy ones, apply peat with ashes, or peat with lime, if at command. One of the best gardens we ever worked, was so sandy that it would blow when dry, but by the aid of muck and ashes we gained astonishing crops. As to

Hot-beds, we have already said sufficient in the article, *Profits from Small Places*, p. 63, where some hints on cold-frames, and a substitute, will be found. The novice, in the use of glass, especially if over a hot-bed, needs to be told of the importance of

Airing.—He will learn it after having a crop or two scorched by the sun, but that is rather expensive knowledge. Not only seedlings, but plants that have been wintered and escaped damage from cold, are now liable to be burned; hence,

Cold-frames will need frequent attention, and in the case of lettuce and cabbage wintered over, if the plants are properly hardened, the glass may be removed altogether, and used over other frames.

Seeds.—By all means order at once, and if roots of any kind, or cabbage or other plants, have been wintered over for seed-raising, put them out, the last of the month, in a dry rich spot, and do not plant allied varieties near each other. More attention to seed-raising would lessen the complaints of bad seed. It would be a good thing if the members of local clubs would each agree to raise one or two sorts of seeds. By doing thus, greater purity and perfection could be attained, and each community could raise nearly all its own seed.

Old seeds should be tried, if any doubt exists as to their reliability. Count out a dozen or twenty, put them in a box or pot of earth in a warm place, keep moist, but not too wet, and see the proportion that starts. If half the number grow, it will be safe to plant them. Look over the article on page 52, (last month,) and see if you have all the needed

Conveniences in the Garden.—Those mentioned and figured there are great helps to save labor.

Asparagus.—Remove the litter from old beds as soon as severe weather is over, and if there is not a good dressing of short manure left on the bed, put on some good manure and fork it in. Apply a dressing of 2 to 3 pounds of salt to the square yard. Sow seed for new plants as early as the soil is ready, in a rich bed, in rows a foot apart. Where new plantations are to be made, have the ground highly manured and deeply worked. Set good one or two year old plants, and cover the crowns 2 or 3 inches. The best way for family gardens is to have beds five feet wide, one row in the center, and one a foot from each edge, the plants nine inches in the row.

Rhubarb should have the bed manured the same as for asparagus; plants may be forced as directed last month. Make new beds before the plants start. Divide old roots, as soon as the frost is out, with a sharp spade, to have a piece of root with each eye.

Onions.—Of the Potato variety, Top onions and

sets may be got in early. Put the Potato and Top sorts, 4 or 5 inches apart, in one foot rows. Sets may be put in 9 inch rows, and 3 inches apart. All these bulbs need to be covered, and all the better if the ground is rolled to pack it closely around them.

Peas should be sown early. We hear good accounts of Carter's First Crop, and there are several other early ones offered. Daniel O'Rourke, where it can be had good, is the best known early sort.

Roots, such as Parsnip and Salsify, should be taken out of the ground before they begin to grow, and all plants protected during the winter, such as

Spinach, uncovered and thinned for use as soon as it starts to grow. Sow in a warm corner seeds of early varieties of

Carrot, radish, cress, lettuce, and other things, according to locality and season.

Chives come very early in spring, and are in such demand that, near large cities, they are forwarded in frames. Cut the leaves as soon as large enough.

Flower Garden and Lawn.

Considerable preparatory work can be done here, and if any new improvements are to be made, have them well under way.

Roads should receive more attention than they generally do; in this we include drives and paths of all kinds. A good, dry road or walk is a great comfort, and the reverse is a nuisance. The best part of a road is out of sight. Those who are troubled to get rid of their stone, need have no anxiety as long as there is a bad road on the place. Excavate 2 or 3 feet, fill in with large stones, upon these put smaller ones, diminishing the size as the surface is reached, and finish off with coarse gravel, and then a coat of finer; roll well, and there will be a road that will need little mending, and fit to travel in all weathers; besides, such a road does much towards draining the ground through which it passes, and may be built with a view to drainage.

Lawns are seldom seen in a satisfactory state of perfection. Here the work must begin low down, and drains be put in where they would be required for a garden crop. Manure, plow, subsoil, grade and level with great care, sow and roll. Do the work as soon as the season will admit of it. Blue Grass or June Grass we have found to be satisfactory. In using the mixed seeds, sold under the name of Lawn Grass, we have not been successful. The White Clover, generally, killed off everything else, but this was on the light and poor soil.

Roots, of herbaceous perennials, of all kinds that have been in place two or three years, will do all the better if divided and reset. Do this early, and be liberal with the surplus. Do all necessary

Transplanting of shrubs and hardy herbaceous plants before vegetation starts, and finish up the

Pruning of shrubs, if not done. Do not hurry to

Uncover tender plants, that have been protected by straw or other shelter. There will still be a succession of warm days and cold nights that will be more injurious to them than steady severe cold.

Plant hedges, edging, shrubs and trees on the lawn as soon as the ground can be worked, and the plants be procured. Set out the various

Climbers wherever they are appropriate, and if means are lacking to buy, go to the woods and fence rows and get Virginia Creeper and Waxwork, that are everywhere common. Every country home should have a veranda, with several climbers upon it.

Hardy Annuals.—All those that come from self-sown seeds, such as Larkspur, Whitlavia, Candy-tuft, and most of the California things, do best when warm, as soon as frost leaves, but the

Tender Annuals must be kept back until the ground is well warmed, unless sown under glass.

Green and Hot-Houses.

The heat of the sun will render less fuel necessary. Give air freely on mild days, but close up early, before the air gets chilly.

Propagation will demand the chief attention, as a large stock of bedding plants is needed in most

gardens where there is a green-house. Verbenas, Bouvardias, Pelargoniums, Fuchsias, Ageratums, and all such things may be multiplied in any quantity. The chief point in propagating from cuttings is to keep the temperature of the house 10° to 15° lower than that of the cutting bench, which should be from 65° to 75°. Put in a good stock of

Chrysanthemums, for they are generally forgotten, as they do not bloom until quite late. The best plants are raised from cuttings. Sow seeds of

Tender Annuals, and when large enough, pot them off and set strong plants for use out of doors.

Camellias, and other hard-wooded shrubs, will now be making a new growth, and will need more care in watering, and may be put in a warmer place. Prune, if not already done. The Camellia "breaks" very readily, and may be cut at will, with the probability that branches will start in abundance.

Azaleas will now be in bloom, and those that are in demand may be brought in a warmer place. Give sufficient water when in flower. Keep the better of the green fly and of other insects by

Fumigation with tobacco, and whenever an insect of any kind appears on a plant, do not rest until that plant has been attended to; *principis obsta*, or in plain English, "nip in the bud," should be the motto of the gardener in treating insects.

Forcing Plants, that have been kept in cold frames, may be brought forward, if not already done.

Bulbs, such as Tuberoses and Lilies, may be had in flower earlier, if they are started in pots ready to turn out into the ground in warm weather.

Cold Grapery.

Avoid starting the vines before their growth can be pushed rapidly, and to this end the house must be kept cool by opening the doors and ventilators. While preserving a low temperature, avoid sudden changes. In northern localities, it is not safe to start the vines before next month generally.

Apiary in March.—*Prepared by M. Quinby.*—In consequence of the scanty stores provided in most places, the last season, bees may yet be in danger of starving. If your hives have moveable combs lift them out, and if there is no sealed honey, the bees should be fed. To examine box hives, invert them, if possible, in the sun. Sealed honey will be near the top, and may be seen by clear sunlight. This should be done in the cool morning. Should the bees be disturbed, use smoke to quiet them, and drive them from places you want to inspect. Sealed honey is best to feed bees; strained honey will do, but it is scented farther. If none of any kind is to be had, sugar may be used. Add hot water and make a syrup about the consistence of honey. Feeding is done best at the top of the hive at this season. The feed may be put in a shallow dish, sprinkling out straw upon it, to prevent the bees from drowning. Or a piece of old honey comb may be laid on the top, and a few spoonfuls poured into the cells every day or two. Trail a little down into the hive, till the bees learn the way to the feed dish; feed at night. Cover all with a tight, close-fitting box. This is the season when bees are disposed to pillage. Feeding is apt to induce it. A queenless hive is in danger of robbery; so is a colony very much weakened. The true condition of every stock should be ascertained now. Change bottom boards. Have one clean and dry on which set the hive. Examine among the chips, dead bees and filth, for young immature bees or eggs; any seen indicate the presence of a queen. Clean this bottom board and use it for the next hive. A queenless colony should be united with a weak one containing a queen. All weak colonies should have their entrances contracted, to allow room for only one bee to pass. Dead bees in masses between the combs should be removed before becoming moldy, or, if already so, cut out the combs as far as the mold extends. Feeding flour as food for young bees takes attention from robbing. Rye, ground fine and unbolted, seems to be the best; mix with bran or cut hay. An average of three or four pounds to the hive is sufficient. Place it in the sun, but out of the wind. In setting out bees from the cellar, endeavor to have each occupy the stand of the last year. Choose a warm day, but not too warm. It sometimes happens in large apiaries, where a few are set out at a time, that the first ones, having been out a day or two and everything in order, commence robbing.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 41 Park Row, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upwards, \$1 each. Papers are addressed to each name.

FORWARD: MARCH!!!!

LAST (1866) MARCH,

A Great Many Persons filled up their Premium Clubs, which had been previously begun, and received the valuable articles they desired from our list.

A Great Many Others started new Club lists after the first of March, and filled them up in a brief time, and these also received very valuable articles.

THIS (1867) MARCH,

Three Thousand Persons, at least, may fill up the Premium Clubs for which they have already sent some names, and receive the desired premiums.

Seventeen Thousand Others, (one at each P. O.) may start now and make up a new Premium Club, and secure the excellent premiums.... This is

A GOOD MONTH

To Secure Subscribers. People are beginning in earnest to plan out the SPRING WORK, in the FIELD, in the ORCHARD, in the GARDEN, around the HOUSE, and in the HOUSE. They feel, or ought to feel, the necessity of gathering every hint and suggestion they can obtain from others. They will get a great many valuable and profitable hints from the *Agriculturist*, if some one will show them the paper, explain what it is, and ask them to subscribe for a year.... More than

70,000 Premium Names

have been sent in already this year, besides the regular subscribers; and we have had the pleasure of sending out a very large number of the excellent articles named in the table (next column.) But the supply of premiums is unlimited, and all who want them may get them.... At nearly

EVERY POST OFFICE

in the United States and British Provinces, there are persons enough who would be benefited by the *Agriculturist*, to make up one or more large premium clubs. From some single post-offices, even in small country towns, we have received premium lists of one, two, and three hundred subscribers, gathered by enterprising persons. It only needs some one to show the paper, explain its advantages, and tell how cheap it is, to secure a subscription in every family. Why! for less than 3 cents a week (or less than the cost of a cigar), each subscriber gets a paper containing, during the year, over *Ten Thousand Dollars* worth of original Engravings, besides reading matter that costs nearly or quite *Fifteen Thousand Dollars*. In a multitude of cases reported to us, single hints in this paper have been worth scores of dollars, and often hundreds.

We have abundant evidence that during 1866 this paper saved to the people of the country millions of dollars, by its exposures of Humbugs alone. The New York swindlers have confessed that their business has nearly ceased to pay in the Northern and Middle States "on account of the muss raised by that Judd's paper," and now they have gone to work vigorously down South, where its circulation was disturbed by the war, and is not yet fully restored, though it is rapidly finding its way everywhere there. Let

us have a good premium club at every post-office in all the land, and the humbug business will die of starvation.

Well, look over our premium list, choose the premium you would like, take a copy of the paper, sally out among neighbors and friends, in your own neighborhood and elsewhere (for premium clubs need not be all at one post-office), and in a brief time the desired number of subscribers can be gathered, and the premium secured. A full description of the premiums will be sent free to any one desiring it. Any Specimen numbers, cards and show bills needed, will be supplied free.

Our premiums are all *really valuable articles*, such as we can cheerfully recommend to our friends. By wholesale purchases, by advertising arrangements, etc., we are able to supply them as premiums on far better terms than we could buy and sell them, and we thus pay our canvassers much more than we could possibly do in cash.

We take so much pains to procure only good articles in all cases, that any one securing anything from our premium list, saves the risk usually run of getting poor or indifferent goods, when buying of unknown or irresponsible parties. Every thing we send out as a premium is guaranteed to be the best of its kind and price.

Every article offered is new and of the very best manufacture. No charge is made for packing or boxing any of the articles in this Premium List. The forty-three Premiums, Nos. 1, 2, 6, and from 29 to 32, and from 40 to 75 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Table of Premiums and Terms, For Volume 26—(1867).

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required	
			at \$1.50	at \$1.
1	Garden Seeds for a Family (40 kinds)	\$5.00	13	37
2	Flower Seeds for a Family (100 kinds)	\$5.00	15	37
3	Seeds for a Family (Any kind desired)	\$5.00	30	97
4	Iona Grape Vines (12 of No. 1)	\$18.00	27	90
5	Concord Grape Vines (100 of No. 1)	\$12.00	19	6
6	Japan Lilies (12 Buds)	\$6.00	15	45
7	Sewing Machine (Wheeler & Wilson)	\$55.00	60	240
8	Sewing Machine (Grover & Baker)	\$55.00	60	240
9	Sewing Machine (Singer's Tailoring)	\$80.00	80	320
10	Sewing Machine (Frederick)	\$63.00	70	276
11	Sewing Machine (Wilcox & Gibbs)	\$55.00	60	240
12	Sewing Machine (Howe's)	\$60.00	60	240
13	Washing Machine (Doty's)	\$14.00	21	70
14	Clothes Wringer (Best—Universal)	\$10.00	18	58

Old and new subscribers count in premium lists. **Our premiums** are standard articles, and enough can be obtained to supply all calls for premiums for six months. Every canvasser can take abundant time, but **As fast** as subscriptions are obtained, send them along, that the subscribers may begin to receive the paper; and when all the names that can be obtained are forwarded, select the premium, and it will be promptly furnished. To save mistakes and keeping accounts, send with each list of names, the exact subscription money.

Remit in Post Office money orders, drafts or checks on N. Y. City; if these can not be had, register money letters.

Every name designed for a premium list must be so marked when sent in. (We can not count others.)

For Full Description of the several premiums see October *Agriculturist*, pages 349 to 352, or apply for a *Descriptive List*, which will be furnished free and post-paid. We have room here for only the following:

No. 63 to 74—Good Libraries.—These can be selected by the recipients, from any of the books named in the list in this column. The books will be delivered free of cost, by mail or express.

No. 75—General Book Premium.—Any one not desiring the specific Book premiums, 63 to 74, on sending any number of names above 25, may select Books from the list (below), to the amount of 10 cents for each subscriber sent at \$1: or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each: or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in Our Premiums, Nos. 63 to 75, above.]

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for a month, ending Feb. 16, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
24 days this month	101,000	95,000	14,000	5,000	57,000	124,000
30 days last month	109,500	147,500	2,075,000	514,000	1,059,000	1,227,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
24 days this month	182,000	515,000	995,000	317,000	406,000	30 days last month
24 days last month	248,500	681,000	1,722,000	218,000	546,000	

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
24 days 1867	101,000	95,000	14,000	5,000	57,000	124,000
25 days 1866	109,500	147,500	2,075,000	514,000	1,059,000	1,227,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
24 days 1867	182,000	515,000	995,000	317,000	406,000	30 days last month
25 days 1866	251,000	312,500	956,000	69,000	101,000	

3. Exports from New York, Jan. 1, to Feb. 14:

	Flour.	Wheat.	Corn.	Rye.	Oats.
--	--------	--------	-------	------	-------

1867	33,930	18,688	738,296	73,751	25,443
1866	127,251	61,632	616,575	25,427	19,033
1865	198,225	69,644	53,404	141	9,293

Gold has fluctuated frequently during the month, but only to the extent of 4@5 per cent., closing very little higher than one month ago.... The produce and merchandise markets have been quiet. The demand for breadstuffs, whether for home use or for export, has been restricted to the supplying of the pressing wants of buyers. The receipts have been light, yet receivers have been very eager to sell, and there have been few realizations on the part of speculative holders. Prices have accordingly declined, closing very decidedly in favor of purchasers. There have been considerable arrivals of flour and wheat from California, which have added to the depression of the market. Stocks have been reduced, but this has not been sufficient to strengthen, or sustain the confidence of holders.... The business in Provisions has been more active, but, in the instance of hog products, at a reduced range of prices. Beef has been quite firm. Butter heavy. Cheese rather buoyant.... Cotton has been in moderate request and has been easier in price, on more liberal receipts. The receipts at all the shipping ports of the country, thus far, this season, have been 1,131,000 bales; exports from the ports, 550,000 bales; estimated stock at latest mail dates, 605,000 bales.... Wool has been more sought after, and prices of desirable lots have been well supported, on a rather moderately supplied market.... Hay, Hops, Seeds and Tobacco, have been comparatively quiet.

New York Live Stock Markets.

The transportation of animals to market has been greatly impeded by snow on the railroads, and the supply has been moderate.... **Beef Cattle** have fluctuated in price somewhat, though not much advance has occurred until this week, when a light supply, with little surplus to fall back upon, enabled sellers to put up prices. Two or three bullocks of very extra quality sold at full 18c. @ 19c. lb, net weight, estimating dressed weight 63 to 64 lbs to the 100 lbs live weight; good or first quality, 16c. @ 17c. lb; medium, 15c. @ 16c. lb; inferior to worst, 14c. @ 15c. lb. These prices are not expected to continue, as the railroads again carry cattle through regularly.... **Milch Cows**, though at present in limited numbers, are quite abundant for the very light demand. Really good cows sell at \$80 @ \$90; a few extras at fancy prices, or \$100 @ \$125; common, \$60 @ \$70; poor, \$50 @ \$60. These prices include each cow's own young calf, as no cow will be purchased without this guarantee of fresh milk.... **Veal Calves** are beginning to come in more freely. An occasional extra brings 13c. @ 14c. lb, live weight; the range of good calves average about 12c. lb, while common to poor sell at 10c. @ 11c. lb.... **Sheep** continue in very abundant supply, averaging about 20,000 per week, despite snow blockades. Prices temporarily went up to 7c. @ 8c. lb, live weight, for first class to extras, last week; but the present rates are 6c. @ 7c. lb, for good medium wool, 85 to 90 lb sheep; some extras bring 7c. @ 8c. lb; while common and poor lots sell at 5c. @ 6c. lb.... **Live Hogs** have come in very unevenly, varying from 18,250 to 4,732 per week, and

prices have fluctuated considerably. Present rates @ 10c. lb, live weight, are 7c. @ 8c. lb, for the different grades; dressed hogs 9c. @ 9c. lb.

Containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Forty Pages Again.—To accommodate advertisers, we, for the first two months of the year, gave four extra pages of advertising, and had to leave out many advertisements. This month we give them four more. This is a gain to the readers, as for each page added to the business part of the paper, we give an extra one of reading matter. Thirty-two pages is all we promise.

Read the Advertisements.—They contain a large amount of really useful information, and one going through these business pages very often gets new ideas that prove profitable. A gentleman informed us recently that an advertisement in this paper, some years ago, set him to thinking about a new enterprise from which he has derived more than \$30,000 profit. The present mail and express facilities render it quite easy to procure seeds, plants, etc., from any part of the country; and to go through our advertising pages is almost equivalent to a visit to an immense "variety store." We have rejected far more advertisements than we have inserted, our aim being to admit none but parties whom we have reason to believe will honestly do what they promise in their advertisements. Please gratify the advertisers, by always stating where their advertisements were seen, when ordering, or sending for catalogues, etc.

Supplying the Evening Post.—As announced last month, we send the *American Agriculturist* with the Weekly Evening Post for \$2.50, and with the Semi-weekly Post at \$4.00 a year. It is essential to this arrangement that the subscriptions to both papers come at the same time. We cannot receive additions of \$1 each to former subscriptions, and send the Post. If any present subscriber to the *Agriculturist* wishes to get the Post at the reduced rate, he can send \$2.50 with a new name for the *Agriculturist*, or we will extend his own subscription a year beyond the time to which it is already paid.

The Agricultural Annual, though rather late in making its appearance, has been very well received. It is a very neat volume, in both cloth and paper covers, printed on excellent paper, the illustrations being well engraved and well printed. The Annual is valuable as an almanac and calendar of operations. Some of the tables are not to be found elsewhere, and are well worth the price of the book. For instance, one table

shows concisely the action that has been taken in all the States and British Provinces on the weight of the bushel. There are simple rules for finding the cubical contents of round, square, hopper-shaped, and firkin-shaped vessels. The articles upon draining, horse-training, poultry, potatoes, scientific progress, veterinary subjects, agricultural education, etc., etc., have been before alluded to. There is altogether a great deal of information for fifty cents, and such as every farmer wants.

Fuller's Grape Culturist—New and Enlarged Edition.—Mr. Fuller's work met the general want of a plain and practical treatise on grape culture. As it was based upon established principles, it at once took rank as a standard work. Most of the treatises that have appeared since are nothing more than Fuller modified and diluted. When the structure and mode of growth of the vine is once understood, all systems of training become plain, and one may be followed as readily as another. Mr. Fuller gives this knowledge of the vine most clearly, and illustrates it so plainly that no one can fail to understand it, and for this reason his book has become remarkably popular, and has not been, nor is it likely to be superseded by any other work on the same subject. The teachings of the work are all from actual practice, and the illustrations are mainly from growing vines. As some of the illustrations of unusual methods of training have been said to be fancy sketches, we will state that we know them to be genuine, as we have seen the vines, from which they were taken, growing in Mr. Fuller's grounds. To bring this work up to the times in respect to varieties, a considerable portion of the matter has been re-written. An additional list of varieties, including synonyms, has been given, and important additions have been made all through the volume. Garden culture is treated as well as that of the vineyard, and the book is equally adapted to the owner of a single vine, or the one who has thousands of vines. Ready March 1st. Well illustrated. Price, by mail, \$1.50.

S. S. Lessons for Every Sunday in the Year. consist of four volumes, containing 52 lessons each. No. 1 embraces the period from the Birth of Christ to the end of Acts; No. 2, the rest of the New Testament. No. 3, From Adam to Elijah; No. 4, From Elijah to Christ. The lessons are connected by a running history. The value of these books is attested by the demand for above half a million copies already. They are non-sectarian, and are used by all denominations of Christians. They are designed to secure the learning of portions of the Scriptures, to give a connected view of Sacred History, and especially to aid S. S. teachers and scholars who have not the aid of commentaries and reference books. The full scope of the books is stated in the preface to No. 1. They are sold at a remarkably low price, viz., 15 cents each. We send full sample copies, (Nos. 1, 2, 3, and 4,) post paid, for 75 cents.

A "Staple" Article.—While looking around among the iron workers for other articles, we came across one that we have often felt the want of, and had we known that it was made for sale it would have saved much trouble. It is simply a small staple to be used for fastening wire to posts for trellises and fences. The engraving shows the size and form; the two ends are chamfered in opposite directions, so that, when driven, the points tend to spread, and hold with great firmness. These staples, which will be welcomed by all who use horizontal trellises, are made by machinery by H. C. Richardson, Williamsburg, N. Y., and are sold at wholesale at only fifteen cents per pound, about one hundred making a pound.

The Grandest Excursion of this or any other age, is projected for the present year. About one hundred persons will go on board a large Steamship June 1st, and visit the Azore Islands and Gibraltar; stop eighteen days at Marsilles and Genoa, to allow all desiring it to go up by railway to Paris and visit the Exhibition, and thence eastward to the Rhine, and down through Switzerland to the ship again. Several days will be allowed at Genoa, Leghorn, Naples, etc., to visit the Quadrilateral fortifications, Venice, Florence, Rome, and other Italian cities. The company will visit Capri, the home of Garibaldi, Palermo in Sicily, Athens, Corinth, Constantinople, the Crimea, see Vesuvius and other volcanoes, sail over St. Paul's Route in the Mediterranean, visit Beirut and Joppa, giving time to go down through Palestine from Beirut to Jerusalem, and also from Joppa over, and spend some time around Jerusalem; next to Alexandria, the Pyramids, etc., in Egypt; thence westward through the Mediterranean, stopping

at various points of interest; from Gibraltar southward to the Madeira Islands; across to the Bermudas, and thence home, after an absence of 4½ to 5 months. The excursionists will have their home constantly aboard the ship, where physicians, books, music, etc., are to be provided free. The expedition is to be under the charge of Capt. Duncan—the Captain who has been eighteen years at sea, about half the time as master of large ships—who never swore an oath—never drank a glass of liquor, and though he has crossed the Atlantic fifty-eight times, never suffered a shipwreck, nor lost a man by accident. The company is to be select—every applicant's name is submitted to a committee. If any wish to join the grand excursion, let them send their credentials to Capt. C. C. Duncan, 117 Wall street, New York, who will send all particulars, and inform them if there are any vacancies. The expense will be about \$1,250 for adults, for all expenses on the water, and as much, or a little more, as they choose to spend in land excursions.

Sundry Humbugs.—We have a large box full of letters recently received, describing various swindles. In two other paragraphs we describe the "ticket operators, and Southern swindlers, and bave room for but few words here." Some of the operators have stolen our cards, or got *fac similes* of them printed, and enclose them in their circulars in a way to make us seem to endorse their operations. Others pretend to have obtained the addresses of individuals from us. Once for all we say: *No names of our subscribers have ever been furnished to any person for any purpose whatever, good or bad. No person except those employed to post books and write wrappers, are ever permitted even to look into our books.* Some postmasters, we suspect, have furnished to applicants the names of subscribers to this and other journals at their offices.... We again caution our readers against the pretended cheap sewing machine operators.... Harris & Brothers, of Boston, whom we exposed in October, have been "put under bonds.".... The "Howard Association," of Philadelphia, is to be avoided always.... The "American Artists' Association," Pine st., New York, has been often hunted after, but never found "at home.".... Ditto, Hodge of 197 Broadway—no such man there—ditto, the Tea Company at 109 Water street—ditto, somebody at 512 Broadway.... Milnor & Co. 206, alias 210 Bowery, appear to be the same as Parkinson & Co. 208 Broadway, whom we showed up some time since. There is quite an assortment of swindlers in several upper rooms of 204, 206 and 208 Broadway, all entered by one flight of stairs.... (Rev.) Edward Wilson, of Williamsburg, and J. T. Inman, Station D, Bible House, continue to come the "pious dodge." Our letters contain circulars of about 50 gift and other swindles, of a character similar to those already described in this and previous numbers.... We may stop here, by repeating, that all the gift enterprises, for benevolent or other purposes, the Art Union Associations, etc., are downright swindles.... W. Purdy, a base wretch, of P—, N. J., offers vile pictures, books, instruments, etc. Any of his class who thus offer to steal the morals of the ignorant, will not hesitate to steal any money sent them. Among such fellows rank "Reeves & Co.," of Nassau street; Beach, Putney & Co.; Somers & Co., Dr. Andrews, Birch & Co., White & Co., and many others.... Gilbert & Co. offer stationery parcels, with watch premiums, jewelry, etc., and refer to Cutter, Tower & Co., and Saml. Raynor & Co., both of which firms "don't know anything of this Gilbert," or have given no permission to refer to them.... Beware of "Manufacturers' Associations" who sell by tickets.... See our previous notes on Humbugs for answers to many letters recently sent to us.

Ticket Swindlers—How They Operate.—Among the numerous methods of cheating people, the following is one of the most common: The operator hires a small upper room so as to have a place to receive letters. He buys from some other operator the names and P. O. address of a great many thousands of people, which have been obtained from postmasters and others under honest pretences. He then gets out a very plausible circular, or advertisement, pretending to have on hand a great many thousands of dollars worth of watches, jewelry, dry goods, etc., a bankrupt stock, or the consignment of some failing foreign house, which he claims must be sold, or will be sold at wonderfully low rates. He pretends to put them all together, to be sold by lot, at a uniform price of \$1, \$2, or \$3, or \$5, or \$10 each. He sends out sealed tickets for these things, pretending that they have been drawn by lot, and that he does not know what any sealed envelope contains. Sometimes pay for the tickets is first asked; sometimes they are sent, pretending that somebody has ordered and paid for them. Sometimes he pretends to desire the recipient to act as agent, and promises special facilities. Every person opening these tickets is sure to find among them at least one calling for a watch or other valuable article, "marked at" \$20, \$30, \$40, \$50 or \$75, or more, to be obtained by remitting a tenth of its "marked" value. The recipient

thinks he has drawn a valuable prize, and so sends on the money. This is usually the last he hears of it. No answer is returned to the letters of inquiry he may write; or if hard pressed, the operator pretends the money has been lost by mail, or that he has sent the articles, and that they have been lost. He operates at a distance, so that few people can call in person to trouble him. If one calls, the operator pretends that "the boss is out." If cornered, he hands over the watch, which is usually a showy, but nearly or quite valueless affair. Sometimes one of these taking-looking prizes is sent out as a bait, but in 99 cases in 100 nothing is returned for money sent them. This is an outline of one mode of operating. The same rascal operates in half a dozen or more places, under as many different names; and, with few exceptions, the name is changed every month or two. We have tickets and circulars, ostensibly from over 200 different operators, though not over half a dozen men are at the bottom of the whole of them. A man by the name of Todd has operated under 40 or 50 names probably, but never in his own real name. We say, positively, if you give heed to a single one of these circulars or ticket enterprises, you will lose all the money you invest.

Look Out for Humbugs at the South.—We learn from sundry sources, that a score or more of the most expert swindlers of this city—the gift enterprise men, the watch and jewelry ticket men, etc.—having become discouraged by meeting the *Agriculturist's* exposures at every turn throughout the North, are now directing their efforts especially to the Southern States. (The *Agriculturist*, shut out from those States by the war, and by the prejudice of many of the people, does not circulate so largely in those States as at the North, where it goes to nearly every post office. It is, however, now making rapid headway all through the South.) These Humbug operators, through the aid of postmasters and others, unwittingly given, have gathered up the names and address of more than a hundred thousand Southern people, and they are plying them with their circulars, and plausibly told, but nefarious schemes. See descriptions elsewhere. Southern Newspapers should sound the alarm at once. We are sorry to see that quite a number of them are, unsuspectingly we trust, aiding the swindlers, by publishing their advertisements. Let every one of our readers who has friends or acquaintances at the South, send them a copy or two of this journal, or better send them the paper for a year. A few numbers at any post office would soon head off the swindlers.

Sample Heads of Grain from Germany.—We are indebted to Mr. Ferdinand Hundertpfund, florist, of 197 Broadway, New York, for samples of the mature heads of nearly or quite 100 kinds of Grain—Oats, Millet, Wheat, Rye and Barley. Both summer and winter varieties. Many of them possess extraordinary beauty. They were raised at the Agricultural and Garden School at Karlsruhe, in Baden, and were accompanied by samples of seed which we shall try, and hope to report upon in due time, if any appear to be especially valuable.

190 Different Kinds of Beans.—The same gentleman has left at our office a collection of 190 samples of Beans. Most of them are true beans, though some are of a different but allied species. These also are from the gardens of the Karlsruhe School, of which institution Mr. Hundertpfund was a pupil.

The Officers of the N. Y. State Agricultural Society for 1867, elected at the annual meeting February 15th are as follows: *President*, Gen. Marsena R. Patrick. *Vice-Presidents*, 1st District, Thomas H. Faile, Jr., New York; 2d District, Samuel Thorne, Dutchess; 3d District, Adam Thayer, Rensselaer; 4th District, Milo Ingoldsby, Washington; 5th District, Samuel Campbell, Oneida; 6th District, Joseph McGaw, Jr., Tompkins; 7th District, H. T. E. Foster, Seneca; 8th District, J. H. Plumb, Erie. *Corresponding Secretary*, B. P. Johnson, Albany. *Recording Secretary*, Erastus Corning, Jr., Albany. *Treasurer*, Luther H. Tucker, Jr., Albany. *Executive Committee*, George H. Brown, Dutchess; John Havens, N. Y.; S. T. Taber, Queens; T. L. Harrison, St. Lawrence; W. M. Ely, Broome; James Geddes, Onondaga; W. Chamberlain, Dutchess; J. G. Masters, Erie.

How Often May a Mare Have Colts?—"J. B. S. H.," Hartford Connty, Conn. It is as natural for a mare to have foals as it is to live, and if she is kept well, as you say you keep yours, she may have a foal every year, as regularly as a cow has calves. Only do not overwork her when she is heavy with foal.

Map of Maryland.—Mr. S. J. Martenet, Baltimore, has published a large map of Maryland and an Atlas of County maps, each County being accompanied by a concise account of its peculiarities, with statistics of population, productions, etc. Such a map will be of great use to those who contemplate a removal to the State.

Bommer's Manure Method.—Yes, we did get hold of some old pamphlets which were formerly sold, with the patent, for \$10, and offer them for 25 cents, without any patent. We told our readers that the patent was so old that it had become public property. Is it not, then, absurd to claim that we put it out as something new, or intimate that we tried to deceive about it. Our readers know that the method is old. They may well wonder, as we do, that a patent was ever granted, and that it was pronounced valid. That does not alter the case, nor make the method of less value, to whoever does not know it. We remember well to have seen what, we presume, was the very same method, in use in Switzerland, 12 years ago, and saw it also described, substantially, by an enthusiastic Swiss agriculturist, who termed Switzerland "the native country of the proud dung heap;" and we have often described, and urged upon our readers, practice very similar to Bommer's. Nevertheless, we think the book is worth much more than its price (25c) to every farmer in the country. We would be happy to sell to the *Country Gentleman* as many copies as he wants for his readers, at the usual discount, one-third off, for cash.

Hope for the Farmers' Club.—The people who assemble under the name of the "Farmers' Club" did not like the article, last month, headed "Sense at the Farmers' Club." Of course they didn't. It was intended as medicine, and they were expected to squirm under its operation, but it did them much good. In the report of the meeting of January 22d, there were only six "medical" articles, and in that of January 29th, only two!—a recovery more rapid than that of any patient who will follow their published prescriptions. Here is a specimen of the effects produced by our strictures, from the report of the meeting of January 29th:

"*Management of the Club.*—An agricultural paper in this city speaks of our club as being more comic than wise, and as having better talkers than farmers. Now and then, there is an Ishmaelite boy skulking through the lots. When he sees other boys enjoying themselves together, nothing pleases him more than to throw a stone. 'What can he expect?'"

"Boys enjoying themselves together" is a capital figure, and shows that the club possess the rare ability "to see ourselves as others see us." "Ishmaelite" is also good, and hints at a commendable kind of reading.

Sweet Potatoes.—Several, who have made inquiries about Sweet Potato culture, will be glad to know that we have an article in type from an experienced cultivator which will appear in season.

Catalogues Acknowledged.—SEEDS. —A. Bridgeman, 875 Broadway, N. Y., Vegetable Seeds. . . . J. M. Thorburn & Co., Flower Seeds and Spring Bulbs. . . . James J. H. Gregory, Marblehead, Mass., including many novelties. . . . Collins, Anderson & Co., Vegetables and Flowers, with very full descriptions.

GENERAL NURSERY STOCK.—J. W. Dodge & Son, Pomona Nursery, Cumberland County, Tenn. . . . Husmann & Manwaring, Hermann, Mo. . . . Calvin S. Goddard, Evergreens and Fruit Trees, Portland, Me. . . . John Saul, Washington, D. C.; Roses a specialty.

SMALL FRUITS.—William Hacker, Philadelphia, Pa. . . . Thomas C. Andrews, Moorestown, Burlington County, N. J. . . . Johnston's Nursery, South Bend, Ind. . . . Geo. W. Campbell, Delaware, O., full description of grapes.

FLORISTS' PLANTS.—Ellwanger & Barry, Rochester, N. Y. . . . Joseph W. Vestal, Cambridge City, Wayne Co., Ind.

WINES.—F. C. Brehm, Waterloo, New York.

The Western New York Fruit Growers' Society.—The interruption of travel by the great snow storm, prevented our attending the meeting in January, as we had intended. We observe by the report in the *Country Gentleman*, that the time was chiefly occupied in discussing the grape question. A great deal was said about different varieties, but we do not find that anything new was elicited. A vote was taken on the question "What one variety of grapes is best for garden culture in Western New York?" The Delaware was the choice of the majority. We do not see any report of the vote on the next best. It would be well if it were stated what are the limits of "Western New York," for which the Delaware is considered the best.

Large Barley—Selecting Seed.—C. A. Brown, Stockbridge, Vermont, sowed the product of an accidental head of barley found in a field of wheat; the product of four grains was 1,411 grains; one stool had twenty-three large, fine, full heads. Any grain growing by itself in good soil, will develop wonderfully. Selection of heavy seed will do much. Culling the large, full, ripe heads, and saving for sowing only the heaviest grains from them, will greatly improve the result, but the climax is reached by very thin sowing in drills, giving

hand culture, weeding and hoeing, and continuing this with the most careful culling of heads and selection of seed by weight year after year. The improvement is rapid.

The Surprise Oats.—This, which claims to be a new variety of oat, is put before the public with apparent good faith on the part of the proprietors. The claim is that one Van Olinda, near Sandwich, DeKalb County, Ill., found some strangely bearded oats growing among some other grain (Patent-Office wheat if we mistake not.) We have seen what purports to be some of this original seed, and it looks almost exactly like the wild oat, from which it is known that our cultivated varieties sprung, and to which it is supposed that, under some circumstances, they revert. After several years of care and culture the result is claimed to be that a very plump, heavy, prolific, early variety is established free from the bristly beards, and every way a first-rate oat. We have no means of knowing whether the surveyor, who claims to have measured the 138 square rods of ground on which 375 bushels of oats grew, knew anything about his business or not, or whether he is an honest man. We don't know whether the weight of the oats was taken properly or not. They may have been weighed in bags, no deductions made, and the total weight simply divided by thirty-two, the weight of the legal bushel of oats. The statements in the circular are unsatisfactory and meager, and there is a concealment of the fact that the 133 bushels per acre, means bushels of 32 pounds each, weighed as soon as thrashed. If the weighing had been done in December the results would have required a different statement, and we presume also that the 45 pounds which the measured bushel is said to weigh may be subject to the same drawback. We have admitted the advertisement because the proprietors appeared to be fair, honest men, and certainly showed us a very excellent sample of oats.

Selecting Grain Seed for Sowing.—Take out the screens, except perhaps the top one, and arrange the fan-mill for giving the strongest and evenest blast. Then run the grain through, saving the heaviest half, and repeating the operation upon this several times.

Good Seeds.—"Where can I get 'good seeds?' is the purport of a dozen letters now on file. One says that he is poorer by a thousand dollars than he would have been if he had had good seeds last year. We believe that all the seedmen who advertise with us intend to send good seeds. Much of their stock, imported and otherwise, is bought upon good faith in others, and they may sometimes be deceived. One writes us that Tom Thumb Peas grew from eight inches to five feet, and were growing yet. We do not know a seedman who would intentionally mix seeds. Much of the failure is attributable to the sower, who sows too early, or too deeply. There is not a seedman of our acquaintance who has not been denounced to us as a swindler, and not one who has not been praised to us as the best of all his craft. There is no business in which a reputation is more essential, simply as a business investment, than that of the seedman, and no one who expected to continue long in the business would, simply as a matter of policy, sell a thing if known to be untrue. Seedmen are human and may err, and be deceived, and so with the purchasers. Let us encourage home grown seeds, and then we can be able to trace everything to its source.

A Span-roof Cold Grapery.—"Constant Reader." Much will depend upon your notions as to style. Make out a plain statement of just what you want, and send to John Ellis, White Plains, N. Y., or Messrs. Woodward, No. 37 Park Row, N. Y., and they will give you estimates, and, of course, will expect to be paid for their trouble.

Red Legged Locust.—What shall they do in Kansas? L. A. Alderson, of Atchison, thus states the case: "Last September we were visited by the Red Legged Locust (*Acyridium femur-rubrum*), the same insect that committed such depredation in Utah, Colorado and Montana. They spread over our entire State, and before cold weather they advanced about fifty miles into Missouri. They devoured all our buckwheat, turnips, tobacco, and most of the green fodder, and all the young wheat that had been sown. (Several farmers have sown since their disappearance.) The surface of the earth is filled with their *larva*, and as further West, they will doubtless appear in force in the spring. The *Agriculturist* is extensively read in Kansas, and you would do us a great favor by informing us through its columns what crops, if any, we may be able to raise next summer. It is said they will not destroy sorghum. I have noticed the Castor Oil Bean untouched by them; but I have seen them feasting upon a pod of red pepper and a quid of tobacco. As a general rule the young hatched from the

larva of the preceding fall, leave about the first of July; but this is too late for most of our crops."

Beans, Peas, Millet, Oats, to cut for fodder, Corn for fodder, Buckwheat, Turnips, Rutabagas and Tobacco if the seed beds can be protected, are what we think of as most likely to produce a crop after July 1st; but their success depends on your having no second crop of locusts, and these are usually most abundant in August and later.

Use for Hickory Withe.—W. G. Waring, of Tyrone, Pa., says, that when plowing he broke a clevis, and adapting a strong withe, cut from a neighboring hickory, to the situation, it held well, endured the draft all day, and saved an hour's time of man and team.

Sensible.—At a meeting of delegates from seventy-five of the Ohio County Agricultural Societies recently held at Columbus, Ohio, the following resolution was adopted. We hope that the agriculturists of other States will do likewise. "That the Convention adhere to the resolutions adopted at the session of 1865, and again indorsed in 1866, in favor of one College under the Congressional grant, and opposed to the division of the fund.

The American Journal of Horticulture and Florists Companion.—Boston, J. E. Tilton & Co. Monthly, 64 pages, at \$3 per year. The January and February numbers of this journal have been received. We did not notice the first number, as the publishers apologized for its want of variety and stated that it had been "issued under many disadvantages." The second number contains no such apology, and we suppose it is intended as a specimen of what we may expect, and as several have asked our opinion upon it, we will say that it is a very handsome magazine, on excellent paper and in beautiful type, and is wonderfully cheap. The publishers deserve much credit for giving so many pages for so little money. Why it is called an "*American Journal of Horticulture*," we are at loss to understand, as it is most intensely *Bostonese*. The February issue has the bad taste to give the biography of our revered friend Col. Wilder. We hope that the day is far distant when any one shall have the right to make up his record, and we cannot conceive why he should be thus afflicted. The issue is all about Boston and its suburbs, and though Boston is our pet city, and its people are good to know, we can't see why they call it an "*American*" journal. The articles on Garden Architecture will attract attention for the reason that the illustrations are *nearly as good* as those in *Hughes' Garden Architecture*, recently published in London. We supposed that Boston was the headquarters for pears, and they figure such novelties as the Bartlett, Seckel and Urbanists! But we cannot give the space to an extended criticism. It is pleasant reading about horticulture, and will no doubt be acceptable to the large class who like to have the "road to learning" graded and rolled. Its wordiness is its most objectionable feature, and its diffused light, as compared with the other Horticultural monthlies, is as that of moonlight to sunlight.

Queries.—"Young Farmer" asks the following questions:

Is Johnston's Agricultural Chemistry a distinct work from his *Elements of Agricultural Chemistry*, or an enlargement of the same. *Answer.*—A distinct work, the former much the fuller and larger. The full title is "*Lectures on Agricultural Chemistry and Geology*."

Cabbages.—I have seven acres for cabbage in 1867. This land without manure, with a year or two rest, I deem unsurpassed for cabbage, but having been cultivated without rest in corn, I think manure is needed. What kind shall I use? *Answer.*—Lime, or a muck and lime compost, with super-phosphate, bone dust and ashes.

Stable Manure and Lime.—I have about twenty loads stable manure (not compost), and an indefinite quantity of air-slacked lime; in composting, shall I put in lime, and what proportion? *Answer.*—Use no lime with stable manure; the lime will prove a damage.

Lime.—How shall I apply my lime broadcast. What amount per acre, and what machine, if any, shall I use? *Answer.*—Spread from small heaps with a shovel, or from the tail of a cart. The amount applied may vary from the least quantity you can spread evenly to 300 to 500 bushels. Heavy lands and those of a moist and mucky character, or dark from vegetable mold, will bear much more than light soils; 50 to 100 bushels is a common dose. Small quantities are best applied mixed with muck or soil, and in garden culture this is almost always best. The effects of the lime on the soil in the compost are similar to those which it produces on the soil in the field.

Gas Tar for Posts in Stables.—This is one of the best safe guards against decay, and for a time at least would resist the action of liquid manure.

Miles on the Horse's Foot.—Good shoeing must be systematic. The Miles system has stood the test of thousands of miles under the horse's foot, and that after all is the best test. It has the approval of the best Veterinarians, and many a man who has given the book to his blacksmith, and insisted on the horse-shoeing being done just right, has been rewarded in his own case, and thanked by his neighbors, and by the smith, again and again. See book list. Price, 75 cents.

Single Lines and Left-Hand Plows.—P. F. Wislar, Bucks Co., says: It would be a rare sight to see double lines to drive a plow team in Lancaster County, Pa. More than three-fourths of a century ago, the left hand plow was introduced into that County, and at the present time there are scarcely any right hand plows and double lines seen in that region. The farmers use the left hand plow and single line altogether: drive the leader, or near horse, in the furrow, and tie a jockey stick to the inside ring of his harness, and the other end of the stick tied to the outside ring in the blind halter of the off horse, and a tying strap to the inside ring of the same, fastened to the furrow horse, to keep the off horse from going too fast, and make him walk true to his work. This is the modern style of plowing, and quite an improvement on the old plan of using a right hand plow, and double lines cast over the neck or "round the back of the plowman," with the horses' heads tied together, to harass and baffle them in fly time. With a good leader in a left hand plow, I have set boys, twelve years old, in the middle of a square field to plow what is called 'haw round,' after giving them a start. They would plow the whole field without using any lines. The horses turning at the corners like a perfect machine, and the horse on the land side, pressing against the jockey stick, would walk so true, that, in stiff sod without stones, the plow boy could leave the plow to run alone for several feet on a stretch, which makes it a light task, compared to the old plan.

Farm Proverbs.—"D. E." writes: 1. Use diligence, industry, integrity, and proper improvement of time, to make farming pay. 2. Choose a farm with a soil either naturally dry or drained, not too level nor yet too steep, well fenced in proper sized fields, not too large. 3d. Good, snug buildings, with dry, if not clean, yards and cellars, especially barn and stabling. 4. Economy in accumulating, saving, and properly using all manures and fertilizers possible, no matter how rich your land may be naturally. 5. A good and tolerably fast team, better smart than large. 6. Your farming implements well made, of good material, not too heavy. 7. Have work done in season. 8. Always sow good clean seeds. 9. Do not harvest before your crop is fit to harvest. 10. Don't keep more live stock on your farm than you can keep well. 11. House all things as much as possible—animals, utensils, and crops. 12. Sell when you can get a fair price, and do not store for rats and speculators.

Hints to Horsekeepers.—There are few books which all who own or use the horse, peruse with greater satisfaction than this. We may truly say that we know of no book better worth its price. It is full, yet very much condensed; pleasant reading, yet exceedingly pithy and terse. Price, \$1.75. See Book List.

Cotton Planters' Manual.—This little volume contains much that is valuable, especially to the novice in cotton culture. It is the collated experience of veteran planters. A single good hint from an experienced cultivator might enable a farmer to make a crop by avoiding erroneous practice, or providing beforehand against difficulties or damages which might otherwise be unthought of until too late. See our Book List.

Poultry Book.—The little work on Domestic Poultry, by Mr. Saunders, which we published more than a year ago, and which was subsequently thoroughly revised, receiving important additions, has reached its seventh thousand. In the appendix is an account of Mr. Geyelin's visit to the poultry yards of France, which, in connection with the great interest now-a-days being taken in French fowls, has a peculiar importance.

Home-Made Binding.—"W. H. W." I have stitched three volumes; taking an awl and pricking the holes, sewing with strong thread. Pasting a piece of strong cotton cloth over the back with a strong paste, made by scalding a thin batter of flour, wet up cold, and adding a piece of glue about two inches square, dissolved in hot water, to a half pint of paste. Take paste-board, such as is used by book-binders, of a suitable size, sew to the papers already stitched, including fly leaves, on the back, with your paste, put a strip of enamelled cloth, cut to the proper length and width. Now cover the

whole sides, turning over the edges, with marbled paper; finish by pasting the fly-leaf to inside of cover, and, if neatly done, you have a book handsome enough for any farmer's library, at a cost of only a few cents.

Always Too Late.—Notices of the winter meetings of several of the Western Horticultural Societies, to be held in January, were received after our paper was printed and being mailed. Nothing of this kind is sure to be noticed that reaches us later than the 10th of the preceding month. Will Secretaries of Horticultural Societies please send notices in season?

"Cornea Restorers" and "Eye Sharpeners."—Several have lately asked our opinion of these things, probably new subscribers, as we had an item upon the matter last year. An application was made to us to advertise a thing of this kind, and while our impressions were all adverse to it, we took the trouble, in justice to the advertisers as well as to our readers, to consult one of our most eminent oculists, who confirmed our impressions by his opinion that it "would do more harm than good." If one wishes a watch repaired or a piano tuned, he goes to some one who understands their mechanism and does not tinker them himself. An eye is more valuable than all the watches and pianos that were ever made. Do not trifle with it.

Cheated by the "Doctors."—J. W. Way, sends the names of two quacks, who warranted to cure him for certain sums, and who got his money but left him no better. He wishes us to publish the names of these as a warning to other sufferers. If we were to publish the names of all the quack doctors, of whom we have complaints, it would not do a particle of good, as these chaps don't remain long under one name. If any one who has read the *Agriculturist* for a year, will employ a "Doctor," who advertises that he can do this or that, or who will warrant a cure for a given sum, we cannot pity him very much, as he has already had abundant warning. Nor can we, as J. W. W. requests, publish the names of reliable Doctors. We have no doubt that there are several in his own town who could give him good advice, and in his case he needs that rather than medicine.

Bluffton Wine Company.—A Company for carrying on the culture of the grape and wine making on the large scale has been organized in Missouri. George Husemann is President, and Dr. L. D. Morse, Secretary. The lands of the Company are chiefly in Montgomery County, and have a front of about three miles on the Missouri River. Mr. Samuel Miller, of Avon, Pa., the originator of the Martha, Black Hawk, and other seedlings, is Superintendent of out-door propagation and cultivation.

Teeth and Hair.—"A. A." asks if Zozodont is good for the teeth; and what kind of a hair restorative we would recommend. As we do not know the composition of Zozodont, we can't say, and do not recommend any "hair restorative," believing them to be of no other use than to put money in the vendors' pockets. If there is any disease of the scalp, go to a physician, if not, keep it clean and healthy by washing and friction, and if the hair don't grow no fertilizer will make it grow.

Lathing Upon Adobe Walls.—"West" writes "please tell us if an adobe wall, without studding, may be furred for lathing by nailing strips directly on the sun-dried brick. Will not the bricks be cracked inevitably in the process? To avoid the cost of timber, such as studding, would be a great reason for adopting the adobe." It would be easy in laying up the adobe to put into the wall strips of board; say, a foot or 18 inches apart, for the purpose of holding the nails. This would be the safer course and less expensive than furring in the regular way.—Ed.

Raising Calves Without Milk.—"C. V. B.," of Beaver Dam, Wisconsin, Nov. 5, writes: In regard to bringing up calves without milk the plan I have always found to work well is to feed on "Bean Soup," prepared as for family use, and with the same quantity of salt—say, two tablespoonfuls in each mess (of two quarts.) I have always found the calves to thrive upon this as well as upon milk. I take them from the cow at one week old, and they are never troubled with scours, nor with the opposite tendency.

Dry Earth.—Fine dry soil may be obtained by raking over a loamy spot, taking the stones off, and letting it dry in the sun until it may be dashed through a screen with eight holes to the inch; then covering it at night, and exposing it another day to the sun. This dried it may be barreled, and is as powerful a doodorizer as

gypsum or plaster, an excellent disinfectant and drier for use in privies, hen-houses, or any foul places. The best we ever used was road dust, swept up and barreled on hot days. It was employed in the hen-house. There are laws against taking dirt from the roads, but if the dust were to be replaced by gravel, no objection could be urged.

Agriculture in Hamilton College.—A correspondent informs us that the trustees of Hamilton College, Clinton, N. Y., have received a bequest of \$30,000 from the late Silas D. Childs, of Utica, N. Y., for a Department of Agricultural Chemistry. A well-timed generosity. The immutable laws of Vegetation, Animal Physiology, and Agricultural Chemistry are better worth the study of young men than the shifting statutes that are made and unmade by human legislators.

Peat and Muck.—"L. F. H.," Ohio. The sample sent is apparently a very fair article of peat. You can test its value as fuel thus: Cut out 100 cakes, (like bricks, 2+4+8); dry them thoroughly; weigh a bushel; make a fire in a clean stove, or on a hearth, save and weigh the ashes. If the ashes are more than 10 per cent. of the peat, it will not be very good fuel. Composted with lime or ashes, or manure, after being exposed one winter, or after being treated with lime or ashes, it will make good manure. Three loads of fine muck, with one load of good dung and litter, with a barrel or two of yard liquor pumped over the heap twice or thrice in four weeks, will be better than four loads of barn-yard manure.

Temperature of Cream for Churning.—John S. Larover, Union County, Ill. The temperature is very important in churning, for it is hard work to bring butter if the cream is above 70 degrees, or below 58 degrees F. The best temperature to begin churning is at about 62 degrees, for the friction of the agitation will raise it a little, and 65 is as high as it should ever be at the close. The richness of the milk and cream depends upon the feed and upon the cow; salting the cows regularly, or having it always before them, makes the butter come well, other things being equal. Butter comes easiest when the cream is slightly sour. Then look to the temperature, and make it right by setting the vessel holding cream in an outer vessel of hot or cold water, or lower a tin pail of water into the cream, stirring the cream until it is of a uniform and right temperature from top to bottom. Then, not filling the churn too full, churn steadily, giving thorough agitation until the butter comes.

"Can the Ethiopian Change His Skin?"—"A. T.," of New York City (farm in New Jersey) asks: "Did you ever know of a Spanish cock changing his color? I have one, a splendid fellow, which came into the world raven black, and so remained for nearly a year, when he dropped that garb, and took on another, and is now as white as snow. It occurred about the time Mr. Lincoln issued his Emancipation Proclamation." This change is not a very rare occurrence with Black Spanish fowls, and has given rise to the so-called "White Spanish" breed, in which the white color is fixed. We have heard of none changing back again.

Experience With Ferrets.—Mr. Jacob Flanagan, after an experience of some years with these animals, falls back upon the cat as the best rat catcher. He says: "A ferret can seldom climb to a hay mow, they are so clumsy. I do not think they can smell a rat, and are nearly blind. I have seen them within one foot of a rat and not touch it; but if the rat squeals, they will attack immediately. I thought it might be better if they were trained, and engaged a professional rat catcher to come with his ferrets and dogs; but he did no permanent good. I kept ferrets for three or four years, but to no profit. They would dig out occasionally, and get over the fence around their pen, and kill a good lot of chickens. So I killed the ferrets and bought a young black cat, and always feed her in the barn twice a day, and in no other place. Since the cat came I have hardly seen a rat or mouse about the barn, except in the cat's mouth." [We attach more importance to the confinement to the barn than to the color, though dark colors are best.—Ed.]

Chicory.—L. B. Tift, Connecticut. Chicory is cured by cutting up into pieces an inch or two in length, and drying thoroughly in a kiln at a temperature below that of boiling water. After it is dry it may be marketed. For use it is roasted like coffee, care being taken not to char it, and ground to a coarse meal.

Osage Orange on Timothy Sod.—"J. B. R.," Gentry County, Mo. A good Timothy sod, plowed in the fall, the soil being naturally rich, would, we should think, make a very good seed bed for an Osage Orange nursery, if dry, worked deep, and kept clean.

Turning in Green Crops.—B. M. French asks: "Why will not Ragweed plowed in, be as beneficial to the soil as any cultivated crop?" Because they do not furnish as much vegetable matter. The great advantage of clover as a green crop, is the large mass of roots and leaves it furnishes. So of buckwheat, peas, and other crops used for this purpose. Weeds are better turned under than left to go to seed, but hoed crops should be kept upon the ground until the weeds are subdued. Clean cultivation and high manuring will soon finish them. If Mr. F. can not use clover on account of its winter tilling, try buckwheat, or what is better, drain his land. The cereals do not exhaust land, when they are turned under, but when they are suffered to go to seed, and both stalk and kernel are removed from the soil. Under draining is a remedy for winter killing.

Cockle Instead of Wheat.—A Subscriber asks: "What are the merits and demerits of cockle as an article of food for cattle?"—We have been shy of the article since Job and his friends held their discussion. "Let cockles grow instead of barley," was about as bitter a curse as those old time farmers could invoke on their neighbors' fields, and their cockle and ours, if not the same plant, we guess are of about equal value for fodder. We most decidedly prefer the cereals.

Draining to Dry up Springs.—"B. M. F." asks: "Where springs come out near the base of a hill, will a drain above, five or six feet deep, cut off the water and dry up the spring?" Certainly, if you tap the feeder of the spring, and provide an outlet for your drain. The spring is a natural outlet for an underground drain.

Pumpkins instead of Roots.—"B. M. F." We have never made accurate experiments of the comparative value of these for feeding purposes. Both are very good. Large quantities of pumpkins and squashes are raised in the Eastern States, and fed to milch cows, and fattening cattle, and hogs, both cooked and raw. They pay well. They are not as easily kept as roots, but are raised with less trouble, as they are generally a stolen crop with corn and potatoes, which is very doubtful economy.

Pipe for Liquid Manure.—"B. M. F." This should be protected with a strainer at the upper end. Its liability to obstructions will depend very much upon the fall. The more rapid the descent, the less trouble you will have with sediments. Two inch glazed tile would probably be much cheaper than lead or iron, and would be less likely to be obstructed by sediment.

Plowing Pasture and Meadow.—All land, that is not already too wet, is benefitted by irrigation. Land plowed in winter produces much more grass. It may stand on all winter without injuring the grass. In the summer the water should be carried over the ground in small ditches, and let on at intervals. Draining and irrigation should go together to secure the best results.

Premium Washer and Wringer.—Next to the sewing-machine, the Washer and Wringer have always been favorite premiums with those obtaining clubs of subscribers for the *American Agriculturist*, and hundreds of them have been sent out in this way. The following testimonial to their excellence from so competent a source, is worthy of note. Mrs. Laura E. Lyman, authoress of one of our prize Housekeeping Essays, writes, "I have for some time been using the Doty Washer. It is in the highest degree a labor-saving machine, and also a great saver of clothes, as it dispenses almost entirely with the old mode of rubbing them on the wash-board. With two children, a girl of twelve and a boy of seven, the washing can be done with no fatigue on my part and little on theirs. With the Washer and Wringer there is avoided the inconvenience and danger to health of having the hands immersed, now in hot, and then in cold water. Doty, for his invention, deserves the gratitude of every housekeeper."

Vermont Agricultural Society—Significant Wool Resolutions.—The State Agricultural Society, of Vermont, held its annual meeting on the 2d of January, and in the resolutions passed respecting the tariff bill, now before Congress, praying its passage, a remarkable admission was made, namely: "Our own wools are lying on our hands uncalled for at any prices that would pay over half the cost of production." We would ask Vermont farmers if they think this fact an especial recommendation for the greasy Merinos they are so proud of? Other people can sell their wool. But we hear that the clips of two or perhaps three years are chiefly still in first hands in Vermont. Why? Not because of low tariffs, but because, if manufacturers can buy wool they will let grease alone. When it is bought and sent to the New York market, it is avoided by all manufacturers,

and the purchase of these greasy fleeces, cleansing them thoroughly, and returning them to the market, constitutes a lucrative business. If Vermont wool growers, will but tub-wash these fleeces, they will save a large amount of excellent manure for use upon their farms, and find a ready sale, at a fair price, for the stock now on hand. We do not argue against the tariff, but only against grease.

Experience with Sorghum.—H. K. Smith, of Putnam Co., Ill., writes: "L. Grafton's experience in the January 'Basket' is in some ways very different from my own. I have worked at it on 'Cook's' Evap. for 7 years, and prefer the original black-seeded Sorghum. *Green cane is not fit to work.* It will not make sugar for me, and but little syrup. What syrup I make when the seed is *entirely ripe* makes a great deal of sugar, often $\frac{1}{2}$ to $\frac{1}{3}$ of the barrel will be *grained*, but *never a grain* when the cane is at all green. My molasses (not syrup) will not keep over summer if the cane is not ripe, but works, sours, and forms more or less *jelly*. I can tell 'Grafton' just what makes the 'salty taste' in the molasses. I have had half a dozen lots that were grown on a *pig pen site*, where *rich manure* had been hauled out, or an old straw pile, and they universally tasted *salty*; one so much so that we could scarcely taste it. We never manure in Illinois for cane. It grows a *good crop* upon land that has been farmed steadily, and without manure, for 25 or 30 years, and which will not raise good corn or wheat. Three years ago I cut the seed of some Sorghum when it *was in bloom*, let it stand three weeks, worked up two-thirds of the lower end of stalks, it made a beautiful molasses; 6 gallons to a barrel of 36 gallons, which nearly all grained, forming *very fine crystals*. We think it improves the quality of the cane to store it *in cool weather*. We make a great deal of molasses here in Illinois. To show you that I have had experience in evaporating, I will state that my molasses always commands the highest price in market. I can always get all that I wish to work, and more, at *one-half* the equivalent price."

Am. Dairymen's Association.—The second meeting of this association under its present organization was held at Utica, N.Y., on the 9th of January. The attendance of dairymen was large, and included many from Canada and from the Western States. The feature of the meeting was Mr. X. A. Willard's report of his observations abroad, in regard to cheese-making there. Mr. Willard is a thoroughly practical man of culture, and probably better informed in regard to cheese-making than any other man in America. His address was very interesting, and his observations and conclusions, when given to the public, as it doubtless will be, will be productive of great good. Officers for the current year were elected. The President is George Williams, of Oneida, N. Y., and the Secretary Geo. B. Weeks, of Verona, N. Y.

The American Cow Milker.—"J. J." of Spring Valley, Colorado, and others, ask if we have yet found out whether or not the cow milker is a success. We have visited the office once and again, in order to find out when we could go to see the milker in use. We were told that none were in use hereabouts, that the employees at the great milk stables would moan any one attempting to introduce them, and that they had been out only a few months, and had not been tried very long any where, etc. Each time they told about the same story. The same machine, to all appearance, was exhibited at the World's Fair in London, in 1863, and we have tried in vain ever since to know of a fair trial being made. We have written to their agents at a distance and got no reply, and on the whole, have not as much faith in it as in the more tedious hand process.

The Horticultural Laws of Illinois.—Every one with much experience in fruit growing knows that certain marauders consider all kinds of fruit as "free plunder," that these thieves have a way of taking one's choicest specimens, and that it is very difficult to meet such fellows with the "common law." To remedy the difficulty of convicting fruit thieves, the State of Illinois has passed some very stringent laws, which we copy, in the hope that these, or similar laws, may be enacted in States in which the Legislature is now in session:

AN ACT TO PUNISH FRUIT THIEVES.—Be it enacted by the People of the State of Illinois, represented in the General Assembly, That if any person or persons shall hereafter enter the inclosure of any person, without the leave or license of such owner, and pick, destroy, or carry away the fruit of any apple, plum, peach, pear, or other fruit tree or bush, such person or persons shall be guilty of a misdemeanor, and upon conviction thereof, may be fined any sum not less than ten dollars, nor more than fifty dollars, and may be imprisoned in the county jail for any period not exceeding twenty days. The penalties incurred by a violation of this act may be enforced by indictment in any court having jurisdiction of misdemeanors

in the county where the offense is committed, or the fine may be recovered in action for debt before any justice of the peace of such county.

AN ACT FOR THE PROTECTION OF FRUIT, AND ORNAMENTAL TREES, SHRUBBERY AND VEGETABLE PRODUCTS. SECTION 1. Be it enacted by the People of the State of Illinois, represented in the General Assembly, That if any person or persons, in this State, shall willfully, maliciously and without lawful authority, cut down, root up, sever, injure, peel or destroy any fruit or ornamental tree, cultivated root or plant, fruit or other vegetable production, grape, strawberry or cranberry vines, currant, gooseberry, raspberry, or cultivated blackberry bushes, standing or growing on or being attached to the land of another, or shall, willfully and without lawful authority, cut down, root up, destroy or injure any fruit or ornamental tree or shrubbery, planted or growing on any street, lane, or alley, or public grounds, in any city, borough or incorporated town in said State, every such person so offending, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine of not more than five hundred dollars, or by imprisonment in the jail of the county not exceeding three months, or both, at the discretion of the court, and shall, moreover, be liable in double the amount of damages to the party injured. This law to take effect from and after its passage.

Annual Meeting of the Connecticut State Board of Agriculture.—This body was authorized by the last Legislature of the State, and was duly organized at its first session in New Haven, on the 8th of January, his Excellency Governor Hawley in the chair. It is composed of certain *ex officio* members, besides the Governor, and two representatives from each of the eight County Agricultural Societies, making about twenty members. By special invitation, the *American Agriculturist* was also represented at the meetings, which were continued with unabated interest for three days. A circular, issued by T. S. Gold, Secretary of the Board, proposing certain questions upon drainage, irrigation, and fruit culture, called forth a good many replies, and led to the attendance of some of the most distinguished farmers and fruit growers in the State. The Board had also made provision for lectures by Professors Johnson and Brewer, of the Yale Scientific School, which added much to the interest of the occasion. These were interspersed by discussions upon the topics indicated, and by reports from the various Agricultural Fairs held in the several Counties of the State. The County Societies are all kept up, and fairs are usually held, but not with uniform success. The following resolutions, looking to the improvement of these Societies, were introduced, and much the liveliest session was spent in their discussion. As they are of general interest and very suggestive of the wants of similar Societies in all parts of the country, we give them in full:—

Resolved, That we regard permanent buildings, as well for live stock as for manufactured goods, essential to the permanent success of our Agricultural Societies, thereby enabling them to continue their Fairs for a longer period in each year.

Resolved, That the location of these buildings in regard to facility of access by rail or steamer, is of the first importance.

Resolved, That we recommend to the Agricultural Societies the practice of securing contributions of stock and manufactures by personal solicitations of breeders and manufacturers, and devoting some time previous to the days of the Fair to this object.

Resolved, That we recommend the publication of the proceedings of Societies, and their distribution through the country.

Resolved, That we recommend to breeders the importance of explaining at the Fairs the qualities in the stock that they consider of chief value, with statements of their practice and success.

The County fairs are doing a good work, and they ought to be kept up in all the States where they are in existence, and to be organized where they are not. A County embraces usually just about territory enough to bring together a good representation of the several branches of agriculture, horticulture, and manufactures, and to make an interesting exhibition. A single town does not give variety enough, and the expense is a very serious objection. The impression left upon our mind by the meetings is, that the agricultural and horticultural interests of the State are in a thriving condition. The organization of this Board by the Legislature, after the example of Massachusetts, as one of the permanent institutions of the State, with its Secretary and Annual Volume of Transactions, is a cheering indication. The facilities afforded for the meetings at the Hall of the Sheffield Scientific School, the gratuitous lectures given by Professors Johnson and Brewer, and the cordial welcome of all the Professors to the Board, and their guests, show that science is ready to extend its aid to these interests. Our thanks are due to the Board for their generous hospitality, and to the Yale Professors for numerous favors.

Valuable Experiments with Potatoes.

Dr. Hexamer, of New Castle, N. Y., furnishes us again (see last vol., p. 98) with an account of some very important experiments of his with potatoes, and also with the tally of his crops reduced to bushels per acre for each sort. We should preface the specifications of these results by stating that Dr. H. is an accurate and scientific experimenter and observer, and a good farmer. His results have a scientific value.

RESULTS OF EXPERIMENTS.

1. Out of 70 hills of potatoes, peeled so that no eyes were visible, 35 grew. Some produced very large potatoes. The planted potatoes remained, mostly, hard and firm till digging time.

2. Out of 80 hills, pieces cut without eyes, 13 hills grew. All of these sprouted on the cut surfaces, none through skin. (One large potato, cut in two lengthwise, sprouted on the cut side near, but below the skin, and there was no sprout proceeding from a visible eye.)

3. Out of 100 whole potatoes, 98 grew from the small end, and 2 at the side. With more than half the number of potatoes planted whole, only one eye grew, the rest remaining dormant.

4. A potato does not always expend all germinating power in one year.

5. Wet rot and dry rot are one and the same disease. Potatoes affected with the rot, will rot dry when they are kept dry, and the same will rot wet when they are kept in a moist place.

YIELD OF POTATOES IN 1866.

The following list is arranged in order of productiveness, and gives the number of years the seed has been planted on the farm, and the amount of assorted, marketable potatoes:

Variety.	Years planted	Bu. per acre.	Remarks.
Cuzco.....	3d year	369	No rot.
Monitor.....	1st year	262	Rotted badly.
Pinkney Rustycot.....	3d year	249	No rot.
White Peach Blow.....	3d year	233	Rot.
Fluke.....	3d year	215	No rot.
Peach Blow.....	3d year	200	Much rot.
Mercer.....	3d year	189	Much rot.
Bulkley's Seedling.....	3d year	188	Much rot.
Garnet Chili.....	3d year	166	Rot.
Buckeye.....	3d year	150	Eaten by grubs.
Early Goodrich.....	3d year	145	No rot.
Prairie Seedling.....	3d year	125	Rotted badly.
Early Cottage.....	3d year	113	No rot.
Colbrook.....	1st year	109	Rot.
Blue Mercer.....	3d year	105	Rotted.
Gleason.....	1st year	95	No rot, poor location.
Jackson White.....	1st year	90	Rot.
Dykeman.....	3d year	85	Little rot.
Prince Albert.....	3d year	80	Rotted badly.
White Rock.....	3d year	75	No rot.
Rough and Ready.....	3d year	62	Rotted.
Early Sovereign.....	3d year	57	No rot.
Early June.....	3d year	53	Poor location, no rot.

Cow Stables—Not New but Good.

By GILBERT J. GREEN.

Enclosed I send you a rough sketch of my idea of a cow stable. I would always tie cows, believing it to be the easiest and best plan. This is best done by having a strap buckled around the horns, and always left there; upon this strap in front, is a ring two inches in diameter. In the stable is a rope or chain two feet long, or less, with a ring sliding upon an upright pole beside the manger, on the other end a snap hook. When the cow enters the stable, this hook is snapped into the ring upon the strap, and the cow is securely, as well as comfortably, fastened.

I would arrange the front of the manger, (see figure,) with two diverging boards, having them to touch at the bottom, and widen to the full width of the stall above. These prevent the cow from throwing the hay out of her manger with her head, and getting it under her feet. The stall should be 46 inches wide between the partitions, and 50 inches long between the man-

ger and the gutter, which should be 7 inches deep and two feet wide. The manger should be two feet in width and 17 inches high, in front of the cow. The partition should extend across the manger, and be five feet in length and four or more in height. The floor (as well as the bottom of the gutter,) should be made of asphaltum or coal tar, two inches higher in front than it is behind. Such a stable is clean, durable and convenient, the cows have plenty of room, their heads are not closely confined, you scrape over no broken planks or rough stoues in cleaning out the stalls, but a smooth, even floor, that absorbs no moisture, generates no foul odors, and is easy for the cow to stand or lie upon, even without litter.

MANGER FOR COWS.

Walks and Talks on the Farm—No. 39.

The winter so far has not been favorable for wheat. Severe winds and little snow, with sudden freezing and snowing. One morning the thermometer on my stoop marked 8° below zero, and the next day we had a thaw, followed by high winds, and then a hard frost. This, with bare ground, will severely try our winter wheat, especially where the land is not drained.

The Doctor has bought a stack of nice clover hay at \$9 a ton, delivered. He is not feeding his cows so much corn-pudding this winter. It costs too much, and clover hay and carrots are much cheaper. A little grain in addition, however, is a great improvement. The Doctor raised a splendid crop of carrots, and lectures me for not growing more on my farm. I tell him that as soon as I get my land clean and rich I propose to beat him in raising root crops. All my efforts at present are directed to this one object—to get my land clean and rich. There is no profit in farming until this is accomplished. Fortunately in making land clean you do a good deal towards making it rich. And when it is once rich, this very process of keeping it rich will do a good deal towards keeping it clean.

I told the Doctor that the manure from the clover would be worth as much as he paid for the hay. A practical farmer who heard the remark thought this an extravagant estimate. He draws a good deal of manure from the city, and says he has made up his mind to sell everything from the farm that brings a good price—straw, hay, grain, roots, and anything that can be turned into money. He thinks a farmer cannot afford to make manure by feeding stock. That the only way land can be profitably manured, from the farm itself, is by turning under green clover.

Situated as he is, near the city, it may be cheaper to buy manure than to make it by feeding stock. But he cannot afford to sell clover hay for nine dollars a ton. The cutting, curing and stacking cost, say two dollars a ton, and weighing and delivering it to the purchaser at least a dollar more, so that he does not net over six dollars per ton. A farmer who wants manure had certainly better plow in the clover than sell it at such a price. But I do not think he need do either. Hay is always worth something to feed out to cows and sheep. Some years it

is worth more, some less, but, taking one year with another, it is worth at least the expense of cutting and curing, and drawing back the manure. The real question to be considered in determining whether it is better to plow in the clover, or to make it into hay and feed it out is: can you harvest the clover and draw back the manure for what the hay is worth to feed out?

"I would really like to know how you make it out that the manure from a ton of clover is worth \$9.00?"

"We know how much nitrogen, phosphoric acid, potash, etc., the clover contains, and we know about how much is retained in the increase of the animal eating the clover, and consequently we know how much would be left in the manure. We know, furthermore, how much these ingredients cost when purchased in the form of Peruvian guano, or other artificial manures; and from these and other data, it is easy to determine the value of the manure made from any article used as food."

"That may be all very well, but still I do not believe the manure from a ton of clover hay is worth \$9.00. It cannot be. *There is not bulk enough.* I do not believe you would get, after it was fed out, over half a load of manure, and I can buy good stable manure for a dollar a load."

"Well, suppose you can, and that it costs you another dollar to draw it; I question if you get manure cheaper than you would from clover hay at nine dollars a ton. You do not draw much more than a ton of this fresh horse litter to a load."

"Probably not, taking one load with another."

"Very well. A ton of this fresh manure, then, costs you two dollars by the time it is deposited in your barn yard, or in the field."

"This is rather too high an estimate. I have not much for my man and team to do in winter, except to draw manure. But let that pass."

"The question then is, what is the real value of this ton of fresh manure, calculated on the same estimate that we apply to the manure made from clover hay. Nitrogen, phosphoric acid and potash are, confessedly the most valuable ingredients in any manure. A ton of ordinary barnyard manure contains: Nitrogen, 8 lbs.; Phosphoric acid, 4 lbs.; Potash and Soda, 11 lbs."

Fresh, solid horse droppings, without any admixture of straw, would contain a little more nitrogen than the above estimate—say 10 $\frac{1}{4}$ lbs.—and would be proportionally more valuable. On the other hand, solid cow dung, unmixed with straw, contains, according to the best analyses, less than 4 $\frac{1}{2}$ lbs. of nitrogen to the ton.

Now a ton of good clover hay contains about 50 lbs. of nitrogen. And if we assume that 3 lbs. of this nitrogen is retained in the animal, or otherwise disposed of by the vital functions, we shall have 47 lbs. of nitrogen in the manure made from a ton of clover hay. The clover, too, is exceedingly rich in potash.

To sum up the matter, that it may be understood at a glance, we put the figures side by side:

	A ton of ordinary manure contains	Manure from a ton of clover hay contains
Nitrogen.....	8 lbs.	47 lbs.
Phosphoric acid.....	4 lbs.	12 lbs.
Potash and soda.....	11 lbs.	40 lbs.

In the manure made from a ton of clover hay we get nearly four times as much potash and soda, three times as much phosphoric acid, and nearly six times as much nitrogen. The latter is the ingredient of most value, and we shall not be far wrong in concluding that the manure from a ton of clover hay is worth five times as much as a ton of common manure.

"This mode of reckoning is not satisfactory.

I would like some practical proof. Manure from clover is not a new thing, and I have never noticed that it was so much more valuable than stable manure, as these figures indicate. In fact, I don't believe it. There is not bulk enough."

"You think highly of green clover plowed under for manure. Now, how many tons of green clover does it take to make a ton of clover hay?"

"Probably five or six."

"Very well. Now, how much manure do you suppose that five or six tons of green clover would make, if thrown into a heap in the barn yard and allowed to rot, with water enough to keep it moist? *Would it not make more than half a load?*"

I did not press the question. It seemed to throw new light on the subject. Of course, a ton of hay made from five tons of green clover is worth just as much for manure as if the five tons had been fed out in the green state. The four tons of water dispelled from the grass in curing has no value as a manure.

The farmer who sells clover hay will soon impoverish his land. He cannot grow too much of it, but every pound should be plowed under or fed out on the farm, and the manure carefully preserved. The former practice was all very well when the country was new, and butter, beef and mutton sold for almost nothing; but now that there is an increasing demand for these articles, the practice of plowing under so much valuable food is a loss to the farmer and to the consumers of meat. When fed to animals, we get back in the manure nearly or quite 95 per cent. of all the elements of plant-food (except carbonaceous matter) that the food contains. And this carbonaceous matter has no manurial value. We can spare all that the animal can digest from the food without the slightest injury to the manure. If anything, it is improved by the processes of mastication and digestion. The only ingredients of any value that we lose are the nitrogen, phosphoric acid, potash, &c., and this loss is not over 5 per cent. The food of horses, cattle and sheep contains so much indigestible woody-fibre (carbonaceous matter) that, even after the animals have taken out all they can digest, there is still left in the manure more than enough to meet the demand from the crops to which the manure is applied. A ton of dry horse dung contains 1,632 lbs. of this carbonaceous matter; dry sheep dung, 1,698 lbs., and dry cow dung, 1,714 lbs. On the other hand, a ton of dry, solid excrement of the pig contains only 1,108 lbs. of carbonaceous matter. This is owing to the fact that pigs are supplied with food containing less woody fibre. But even in the case of pigs it will be seen that more than half the dung consists of carbonaceous matter. In ordinary barn-yard manure, where straw is used freely, the proportion is even still greater. We need not plow in clover, therefore, for the sake of getting carbonaceous matter. And this is practically about all that we lose when it is fed to animals.

Manure made solely from straw and corn-stalks is hardly worth the labor of drawing it out to the field and spreading it. The manure from a ton of wheat straw is worth \$2.68, while that from a ton of clover is worth \$9.64. This is Mr. Lawes' estimate, and it is undoubtedly a close approximation to the truth. The price will fluctuate according to circumstances, but if the manure from a ton of straw is worth \$2.68, that from a ton of clover is worth \$9.64.

Now, then, ten tons of straw, half of it fed to cows or sheep, and the other half used as litter,

would give us about 28 tons of manure. Assuming that there was no loss from leaching, &c., this 28 tons would be worth, say \$27.

On the other hand, 5 tons of clover hay, and 5 tons of straw for litter, would give 28 tons of manure, worth \$61.60. Add a couple of tons of oil-cake to the hay and straw, and you would then get 29 or 30 tons of manure, worth \$101.08.

When it costs so much to draw out and spread manure, it should be our aim to make it as rich as possible. The addition of oil-cake to the ordinary feed does not, according to Mr. Lawes, add more than 11 lbs. additional weight to each ton of the manure, "a quantity which," he truly says, "is so small that neither the man that loaded the cart, nor the horse that drew the dung to the field, would detect it." And yet, as before stated, the substitution of clover hay for straw, and the addition of the oil-cake, would make one load more than three times as valuable as that made from straw alone. Ordinary barn-yard manure contains 70 per cent. of water; and in the spring it doubtless contains a good deal more; and it will readily be seen that the addition of a few tons of oil-cake to the feed adds very little to the weight of the manure. If it costs half a dollar a ton to draw the manure to the field and spread it, the net value of the straw made manure would be less than 47 cents, while that from the half hay and half straw manure would be \$1.77, and that from the manure, with oil-cake added to the feed, would be \$3.11. In other words, after deducting the expense of handling the manure, the net value of the oil-cake dung is nearly *seven times* as great as that of the straw made dung.

I believe there is no error in these figures, and they show the importance of paying more attention to the subject of high feeding, viewed merely from the effect of the food on the value of the manure.

A Canadian farmer writes me that he thinks I "unduly magnify the trouble of storing roots for winter use." "Any one," he says, "who has a dry side-hill near the barn, can make a cellar, with 350 feet of rough 2 inch plank, capable of holding seven or eight hundred bushels of roots." I do not think that this proves anything. Seven or eight hundred bushels of roots are better than nothing, but, after all, what do they amount to? They are equal, perhaps, to 4 tons of clover hay. If, on a farm of 200 acres, we could raise, and readily store away, *twenty thousand* bushels of roots, they would amount to something. In England, double this amount is not uncommon. I have seen a hundred thousand bushels of Swedes grown in one field! At least, there was a splendid crop, and there were 120 acres in the field, and there were on the same farm several other fields of turnips 80 to 100 acres each! Now, when I "magnify the trouble of keeping roots" in this climate, I had reference to growing them as a general crop, on the same scale as we grow clover or corn. It is not easy to see how this can be done without a great change in our system of winter feeding. But I do not despair of seeing the change effected. There is no difficulty in raising the roots. The trouble is in storing them and feeding them out. A few hundred bushels, to be used occasionally, as a kind of tonic, are useful; but so far as the mere supply of nutriment is concerned, they are now, as most farm buildings are arranged, more plague than profit. We must have system and regularity in feeding, and we must either have a large supply of roots, or feed them out in such small quantities that they can go but a short way towards supplying the ne-

cessary food. I have 20 head of cattle and 200 sheep. If they were allowed all the roots they would eat, which is the English rule, "seven or eight hundred bushels" would not last them two weeks. Raising a few roots for a condiment is all very well, and need involve little trouble in preserving them. But this was not what I had reference to. I want to see a dozen acres of roots to the hundred acres. To store and feed out such a quantity will tax our ingenuity. But it will yet be done.

For the American Agriculturist.

Shall We Have An Efficient Dog Law?

Many of our State Legislatures are now in session, and others will be soon, and we wish to call their attention to one of the most important interests of their constituents—sheep raising. It is hardly possible to exaggerate the importance of this subject. It concerns the people of the city and country alike. For the only wholesome meat that is within the means of all in the city is the flesh of sheep, and the price of this must depend upon the supply of the flocks afforded by our farms. With mutton at present prices, we believe that sheep are one of the best crops of the farmer. We can afford to raise them without counting the wool and pelts. As a means of renovating old pastures, and keeping the soil in good heart, the sheep surpasses all other animals. No meat is more wholesome than mutton, and, but for dogs, it could be upon every man's table in town and country, at much less cost than we now have it.

The dog is the natural enemy of the sheep, and needs to be kept under by efficient legislation in all the States. The whole dog tribe, Tray, Blanche and Sweetheart, hound, cur and spaniel, should be made expensive luxuries, to be kept in kennels and leading strings, or exterminated. We never go down to the dog pound in your city, on a July morning, where they drown them by the hundred, without a feeling of grim satisfaction, "served 'em right." These animals destroy sheep by the thousand, and in districts where their growth is unchecked, they make sheep raising almost an impossibility. The business is so precarious that no man wants to embark his capital in it. He must either keep a man to watch his flock all the time, and yard them at night within a dog-proof fence, or give up the business. The dogs destroy vast multitudes, but the chief evil that they do is that of inspiring apprehension, and making flocks insecure. They operate as a constant check upon production.

Now, we want a State law, in every sheep growing State, that shall do for country dogs, what the city ordinance does for its canine population, in summer. The statute should outlaw the whole tribe. It should brand the dog as an enemy to the commonwealth. It should say to his owner, "Take care of that animal or we will do it for you." It should make the dog contraband. His owner should pay a heavy tax on him; should keep him muzzled; and a large bounty should be offered on all dogs running at large. The taxes should go to a fund to pay for the damages done to the farmers' flocks by dogs.

They have a curious dog law in Connecticut, leaving it optional with the towns to enforce the provisions of the statute. One town may make clean work with the dogs, and the next may offer a premium on puppies, and look to its neighbors' sheep pastures for dog feed. This makes a farce of legislation against these animals. We want one law, for a whole State,

that will make a sheep as secure as a cow in the remotest pasture upon the farm. Then we can have cheap mutton whether wool is protected or not. We earnestly hope that this matter may

SIC SEMPER CANIBUS.

be taken up for discussion in our farmers' clubs, and agricultural societies, and that measures may be taken to secure efficient legislation, and mete out exact justice to our dog population. Failing in this, we suggest a resort to cold lead, hemp, strychnine, anything that will abate the crying nuisance. CONNECTICUT.

[Our artist has caught our correspondent's idea, and illustrated the "hemp."—EDS.]

Willows and Withes.

Mr. W. G. Waring, of Tyrone, Pa., writes : "Having had occasion lately to use a great many long, strong withes, and becoming fatigued with the necessary twisting, we contrived a little machine for doing it, which works with such ease and completeness that we think a description of it will be welcome to very many. In an evening hour, by the warm fireside, we can comfortably prepare enough to use the next day, and in superior condition for quick, secure work. We use them for binding fodder, straw, bags, bundles of trees, roots, brush or poles, and for connecting portable fence panels and gates, etc. The machine is very simple. In fig. 1, *a* is a piece of hard seasoned wood, as thick as a broom handle, and four or five inches long. It is fitted into a carpenter's brace as a bit. A hole is bored into the end two or three inches deep, and then burned into a triangular form with an old saw file. The brace and bit are then fitted across the top of the V of one end of a saw-horse, using two staples of wire or hickory to keep it in place, and the butt of a willow rod is dressed with

three cuts of a knife, so as to nearly fit the triangular hole in the wooden bit, into which it is then inserted. A strip of board as long as the withes is laid with one end resting on the tie-piece (*b*) of the saw-horse, and the other end resting upon a stool. While a boy sits on the horse end, you sit on the stool; this steadies all. You take the small end of the withe in your hands, as in fig. 2; the boy turns, and that end will immediately be twisted. The hand *a* advances as the twisting progresses, and the bend which it gives to the rod aids the twist to splinter, and makes the rod easy to hold. The boy now places his hand at *a*, and continues to twist, while you use your right hand to knot the small end *b* into a loop, as in fig. 3, securing it by passing the point through the loop, as seen under the thumb. The withe is now completed, and much sooner than described. You may pull it out of the bit, and then lay it aside to untwist; or, if you wish to preserve the open form of the loop, convenient for inserting the butt end when tying, and also to keep the cord-like form of the withe, you must have at one side a piece of plank nearly as long as the withes—at one end a little upright pin on which you string the loops successively, while the boy sticks the butt into a hole in the other end of the plank to prevent untwisting. If you have warmed the rods before twisting, either over the stove, or more equally, and without danger of scorching, by standing them, excepting two or three inches of the butt, in a vessel (like a piece of tin spout-tube), filled with hot water or steam, then they will retain their twist perfectly when taken

off the plank in the morning, and they may be carried on the pin to the field like a string of fish. They will be found exceedingly handy and pleasant to use. The loop form is most useful for drawing loose bundles into compact bales, and the tying is done by simply grasping the butt end, which has been passed through the loop and drawn tight, giving it three or four twists, sweeping round so as to produce a kink just at the loop. That ties the knot, and it is secured from opening by merely slipping the butt into the bale as at *d*, fig. 4. If it is to be opened soon, a large loop (*e*) affords means of doing it quickly and conveniently. To connect gates, fences, etc., or for rings around calves' necks to hold them by, the withe is woven into a ring like

FIG. 1.—WITHE-TWISTER.

a basket handle without forming a loop. To tie large shocks of corn fodder, two withes can be spliced in a second by passing the point of each through the loop of the other. A dried withe can be used again if soaked awhile.

"No ties equal these for security and quickness of application, and a rod or two of ground—good,

deep, moist soil—should be planted with the sorts of willow that yield the cleanest, longest, longest rods, and these should be cut down every fall, to secure a growth of strong annual sprouts.

"The pleasantest willow to use, on account of its leathery softness and smoothness, clean shoots, and bright varnished bark, is the Varnished Willow (*Salix decipiens*). The foliage is handsome, and the growth erect; shoots clean and long. The Goat Willow (*S. caprea*) yields

FIG. 2.—TWISTING THE WITHE.

very strong withes, of moderate length. The leaves are large, broad and dark, sometimes almost round. The Beveridge, Comewell, and the strikingly beautiful variety called Kilmarnock, (a drooping variety), are Goat Willows.

"The Russell Willow, and the tall White or Gray and Yellow Willows are of strong growth, and are used for a great variety of purposes, as charcoal, from which crayons and gunpowder are made, tan, boards for barrows and carts, turners' and coopers' work, handles for hoes and

FIG. 3.—LOOPING.

rakes, hedge stakes and hoops, as well as withes, and they grow on any soil; whereas some willows do not thrive on dry soil. Fortying young shoots of vines, or espalier trees, the little twigs of the Yellow Willow or *S. vitellina* are superior and very neat. They can be tied like a shoestring, and are fit to use as early as August. These willows branch much, and having the curious quality of snapping or breaking off at the base, they do not yield very long rods.

Cuttings of all the willows grow freely in deep mellow soil, kept clean and moist by a liberal mulch of old leaves, tan, or chaff. They should be set early in April, five inches deep to secure constant moisture without being watered, the base pressed firmly down into the sand or mellow mould, and only one or two buds exposed above ground. The cuttings are easily kept in damp sand in a cellar, or out of doors."

FIG. 4.—BUNDLE.

[Our correspondent adds that, in his own experience he has found it tantalizing to learn about things, and have no hint how to procure them. In this case, though some of these varieties are common in swamps and moist grounds, yet if any one wants such as he describes, the lad whose hands are figured will procure them for a small fee.—ED.]

The Canada Lynx.—(*Lynx Canadensis*.)

This peculiar cat-like animal was once common during severe winters in all the Northern States. And, probably on account of the scarcity of prey in the forests of Canada, which are its congenial haunts, single individuals are now occasionally shot; but it is very timid, avoiding men and preying only upon birds and small, or defenceless animals. The resemblance between it and the Wild-cat or Bay Lynx, (*Lynx rufus*), is quite striking, but it is much larger and of different habits. The Canada Lynx is about 3 feet long to the tail, which is scarcely 6 inches long and much concealed in fur. The head is cat-like, and the ears are large, triangular and tipped with a tuft of coarse black hairs. The general color is clouded gray, somewhat reddish and wavy on the back and sides, and of a lighter gray on the belly. The legs are robust, and the feet immensely large, appearing especially so in winter when covered with long fur. The track in the snow being about 9 inches long—almost like that of a bear. The long, dense, fine fur is much prized, and for this the Lynx is hunted, being trapped with ease in the almost inaccessible solitudes in which it abounds. The creature is a great coward, never attacks men, and when cornered does not make a hard fight, if any, and is easily killed. Its large and softly padded feet present so much surface that even a very slight crust upon the snow supports it, and it is thus enabled to follow successfully those animals whose progress is impeded by snow. When small game becomes scarce, it occasionally attacks deer, and, owing to the same cause, sometimes it is driven by hunger to the vicinity of human habitations, and the sheep, pigs, and calves fall victims to its rapacity. There is no reason to suppose that lynxes have acuter vision than many other animals of the feline family. They have large eyes, capable, like those of the common cat, of great contraction and expansion of the pupils, so that they can use them well in the full glare of the sun upon the snow, and in dark nights also. The animal swims and climbs well, exhibits some strategy

in catching its prey, but, on the whole, has little cunning or sagacity. This is especially evinced by the blundering way in which it falls into traps, or is caught under "dead falls," which are logs, or blocks of stone or ice, supported by a "figure 4," or other trip, and which fall, when the trip or trigger is touched, killing by their weight any animal caught beneath them.

CANADA LYNX (*Lynx Canadensis*.)

Our artist has presented us also the picture of the European Lynx, (the *Felis Lynx* of Linnæus). It is an animal of the same genus, and so closely resembles our Lynx that Linnæus regarded both as of the same species. It ranges over the cold parts of Europe and Asia, and we know no reason why it should not also extend across Behring's Straits into North America. Its habits

EUROPEAN LYNX.

are much like the Canada Lynx, and its color similar, but perhaps a little more inclined to reddish-brown, and more brightly marked. Both have a peculiar galloping run when in open ground, shown in the engraving of the Canada Lynx, and when confined exhibit a surly, snarly and utterly unfriendly disposition. It has few enemies, (besides man), and multiplies fast, though the females have but 2 young a year.

Tim Bunker on Horse-Racing at Fairs.

MR. EDITOR—You will recollect that I had my say on this subject some years ago, when the thing was first started. I worked about as hard as any body to get our County Agricultural Society agoing. It cost me a year's labor riding, walking, writing, and elbowing folks around before I could get 'em waked up to it. Some folks are made all breechin, and it takes a locomotive to get 'em started. And when I got the thing on its legs, I hated to see it start off in the wrong direction. We had grand fairs for a few years, before the horse fever struck on. Every kind of stock was brought out, and there was no end to the show of vegetables, fruits, farm products, and home manufactures. We had sometimes ten thousand people out to see the show, and we made money enough to get up buildings, and have first-rate accommodations upon the grounds for exhibitors. Then the young folks thought they knew everything, and nothing would satisfy 'em but fancy horses and racing. I opposed it then, and have been dead set agin it ever since. I shouldn't have said anything more about it now, if the thing hadn't a come up at the last meeting of our County Society, when we was arranging for the fair next fall. You see the horse has been gaining all the while since he got on the track, until more premiums were offered for fast horses than for everything else. Of course folks who had nothing but fine cattle, fruits, or vegetables to show, did not care to come to a fair where everybody was horse crazy, and wouldn't see anything else, if it was as bright as the sun in the heavens. You see a good many of 'em had got disgusted with racing, when they saw it was ruining everything else, and spoiling our fairs. The last two or three years they have been pretty slim, and might as well have been called horse races. Jockeys and gamblers took possession of the track, and had everything their own way. As soon as we got together, I see we were going to have a pretty fight on the horse question. All the horse men were there, with Cicero Smith at their head, and the old fogies were around pretty thick also. Cicero Smith is the son of

Deacon Smith in our town, who don't walk exactly in the footsteps of his father. The deacon sent him to college some years ago, and thought he was going to make a lawyer or doctor of him. But he fell into a very common error of furnishing him with all the money he wanted, and gratified all his boyish whims and fancies. In college, he wanted a fast horse, and had him. The result was that he spent more time with his horse than with his tutors. He cultivated the acquaintance of jockeys, and betting men, more than men of letters, became dissipated, got into all manner of college scrapes, and was expelled. He has been loafing about Hookertown ever since, fond of a dog and gun, of a horse and buggy—but mighty shy of a hoe and shovel, a yoke of cattle and a dung cart. He was just the fellow to head the jockeys in this struggle to get possession of the fair next fall.

Cicero moved to offer a thousand dollars premium for the fastest horse in the race, best two in three, open to all comers. He supported his motion in a telling speech, and waxed eloquent. He wanted to know who did not admire a fast horse. He thought the horse the most graceful and noble of all animals. He never saw a blood horse in motion but he thought of Job's magnificent description: "the glory of his nostrils is terrible. He paweth in the valley, and rejoiceth in his strength: he goeth on to meet the armed men. He swalloweth the ground with fierceness and rage; neither believeth he that it is the sound of the trumpet." He thought the moral influence of fast horses was very good in the community. Everybody had a passion for a fine horse, and it was the legitimate business of Agricultural Societies to meet the popular taste. Nothing would draw a crowd, or fill up the treasury, like the sports of the turf. He thought the prejudice against racing a foolish superstition that was fast dying out. He thought the morals of the community would be greatly aided by cultivating fast horses. He had himself been saved from destruction by owning a fast horse. This provided a wholesome outlet for boyish spirits, and prevented the young from illegitimate pleasures."

Seth Twiggs jumped up as soon as Cicero got through, and said: "He couldn't see things exactly in that light. Perhaps it was because he hadn't been to college. He was glad if there was anything that made Cicero think of any part of the Bible, for he tho't he needed it. He hoped he would read a little further, and learn that the "horse was a vain thing for safety." We had been trying to save ourselves by horseflesh, as a society, for some years, and couldn't come it. The fairs grew worse and worse every year. Multitudes were disgusted and wouldn't go nigh 'em. There wasn't one man in ten in Hookertown that took anything to the fair, because it was managed by jockeys, and fast men, who offered all the premiums to fast horses. For his part, he wanted to carry up his carrots, and pumpkins; but all the pumpkins that stood any chance now was horses. He didn't think horse flesh was jest the kind of medicine for saving fast young men, if Cicero was a fair sample of the cure. In his opinion, there was considerable room for improvement."

Jake Frink said: "I bet on the wrong hoss at the last fair, and I'm agin havin any more racin unless they'll tell who is gwine to win. The scound'rels know all about it aforehand, and it is a blam'd contrivance to cheat a feller out of his money. It is new, and no mistake."

Jotham Sparrowgrass said: "That was a fact," bringing his cane down with great emphasis,

which brought down the house. Cicero began to look more like a sheep than a horse.

Then Mr. Spooner, our minister, got up and said: "He deplored the evils of horse racing, whether at the fairs or elsewhere. It was quite manifest that that evil existed in the Society, and had turned a great many against it. The managers of the Society were responsible for this. They ought to arrange the premiums so as to call out all the products of the soil, and encourage every branch of industry. The annual fair ought to be a school where the people go to learn something about their business, and have a good talk with their neighbors. He did not want to see it turned into a scene of excitement and betting, where black-legs were thicker than blackberries, and well-meaning men were fleeced of their money."

Judge Jones said: "That is my view of the case precisely. The main thing is not to draw a crowd. We want to make the fair help the cause of agriculture. If the crowd come to see the race, and bet, you gain nothing, but lose much. A gambling spirit is fostered, which is exceedingly unfriendly to industry. The man who makes ten dollars on a bet, in six minutes, don't like to work six days to make the same money at the plow-tail. It seems a one-horse way of making money. He wants to try his luck again, and he keeps trying until he is ruined. We used to have full fairs, and money enough, before horse racing was tried. We had, perhaps, as many people now, but they were a very different sort of folks. He wanted to see the solid, substantial men and women of the county—a fair representation of its wealth, and moral worth—at the exhibition. For my part, I have been ashamed to be in the company I found there for the last three years, and I shan't go again till we have a change in the management."

Cicero saw the tide was against him and didn't rally. He was voted down by a large majority. New managers were put in, and next fall, Mr. Editor, if you will come up to Hookertown, we'll show you a fair that "aint all hoss."

The way I look at the horse question is jest this: Speed in a horse is only one of his good qualities. The jockeys make it everything, because that gives the animal his whole value for their purposes. He is just as much an implement of gambling as a pack of cards. I want to see speed encouraged, but strength, beauty, docility and bottom, quite as much. And other domestic animals are quite as important to the farmer as the horse. We want to arrange the premiums so as to call out every form of industry, and make every man feel that he has had fair play. We want premiums, but we want fair play more. Give the horse a fair chance, but don't forget Seth Twiggs' pumpkins.

Hookertown, Conn., } Yours to command,
February 1st. } TIMOTHY BUNKER, Esq.

Vinegar from Apple Pomace.

An Illinois subscriber in commenting upon an article in the January issue on Apple Pomace, says the best thing that can be done with it is to make it into vinegar. It is the practice in his section to make a leach, as for ashes, only on a much larger scale. This may be made in the shape of an inverted pyramid, placed upon a stone or plank platform, and furnished with a trough, or spout at the bottom, to carry off the liquid. Any stout boards an inch or more thick will answer for this purpose. It is a good plan to have this large leach stand near the cider press, and throw the apple pomace into it, as

fast as it accumulates. It need not stand under cover. In a large leach all the rain that falls will be needed to carry off the valuable properties of the pomace. So much of the liquid is exposed to the atmosphere, in the leaching, that it very soon turns to vinegar, and it may be kept running as long as good vinegar is made. This pays much better than feeding, and has given good satisfaction in the region where it has been tried. It economizes an article that is generally treated as a nuisance where much cider is made.

Take Care of the Tools.

Father! where is the auger?" cries out John Smith, Jr. "Don't 'zactly know, son: let me see, where did I use it last? Either in the barn, or wood-shed, or down cellar, and there I left it; look till you find it?" And so the boy runs till he is out of breath and patience, meanwhile thinking, if not speaking hard thoughts about his slack father. A half dozen places have to be searched before the tool is found, and if haply it is found, it is quite likely to be broken, or rusted, or much out of order.

"Father! where is the hand saw?" inquires James Brown. "Why do you ask, James? it is where it always is, when not in use, hanging on the hook near the window, in the tool-room." James goes, where he should have gone at first, and he finds it in perfect trim; and he puts it back again in its place, when he is done with it, knowing that he will get a sound reprimand if he does not return it to its place.

Now, we do but repeat what we have often said, that on the farm there should be a place for everything, and everything in its place. There is no use in trying to carry on a farm or to do anything else well, without system and order. And the care of tools is an important part of that system. One cannot accomplish much without a set of tools, larger or smaller—as for *borrowing* them unnecessarily, that should be regarded as next to stealing them. And the purchase of tools should be followed up by scrupulous care of them. A tool-room is a great convenience. It may be an apartment by itself in the carriage-house or wood-house. Here let there be a row of pegs for saws; there is the bench for planes; yonder is a drawer with separate compartments for screws, washers, nuts, rivets, &c. Here is a place for bolts, there for chains. The hammers, chisels, screw-driver, auger, broad axe, adz, files—all have their appointed locality, and are kept there and no where else. The law should be laid down and enforced, that whoever uses a tool must put it back, so that it can always be found at a moment's notice; nay, even if it be in the dark.

And this care of tools should lead and will lead on to system with regard to other things about the premises. Here is a corner for extra plow handles, and there a box for plow points; there are bolts of all sizes, ready in case of a break down; yonder are hooks with extra pieces of harness. Notice, too, the crow-bar, beetle and wedges, and log chains, the grindstone always in its place, and always in order; the scythes, hoes, spades, shovels, forks, rakes, and what-not have so long been kept in their respective places that they would almost cry out if carelessly left in an unaccustomed spot.

The time spent in keeping such a room in order is not lost. The time spent in carrying back tools after using them is not lost. If tools are not carried back, they would many of them be lost. And then the moral influence of system and order is almost beyond computation.

For the American Agriculturist.

How to Start a County Agricultural Society.

We have hundreds of these societies in all the older States, working efficiently for the promotion of the farmer's interests. Little need be said in their favor where they are known. But there are many counties, especially in the newer States, where a society has not yet been organized, though there are wealth and population enough to sustain one. The want of it is seen and felt, and multitudes are ready to coöperate as soon as the leaders appear. The first thing to be done then, is for a few energetic men, a half dozen is enough, to resolve that a County Society shall be formed, issue a call for a meeting at some central point, a village or city with railroad communication if possible, and invite a delegation from every town in the county. At the meeting adopt a constitution, with the usual provisions, and determine to have a fair the next fall, at the most convenient point.

To call out a good representation of the industry of the county, a large premium list must be made out for all classes of stock, farm products and manufactured articles, amounting to at least fifteen hundred or two thousand dollars; the more the better. The raising of this sum of money is generally the point of embarrassment. The money is not in hand, and the fair, which is to raise it by the sale of admission tickets, is an untried experiment. It may be a failure from lack of interest, from rain, or other causes, and leave the managers in debt. To divide up the responsibility equally, let a delegate be appointed from each town, to canvass his own district for members. These should be of two kinds, annual and for life. The annual memberships should be not less than a dollar each, carrying with them four admission tickets for the fair, at twenty-five cents each. The life memberships should not be less than five dollars, carrying with them one ticket of admission every year, or some other equivalent privilege. A spirited canvasser would be able to secure at least a hundred dollars, or more, for these memberships in each town, and if there were twenty towns in the county, enough would be raised to cover the premium list before the fair came off. You might safely calculate on an advance of fifty per cent. for the attendance of those who were not members.

Then a show bill should be issued on a large sheet, announcing the fair and list of premiums, and be posted at all places of public resort in the county; railroad depots, postoffices, hotels, blacksmith shops, etc. A few weeks before the time of the fair, the managers should see that the county is canvassed for exhibitors. If a man has a fine herd of blood stock, visit him, and make him promise to come out. Secure the attendance of every man that has anything to show. If there are manufacturers of any kind, get them out with their goods. People like to be noticed, and many a man will bring out their best, if asked, who would otherwise stay at home.

Then, at the holding of the fair, let all the arrangements be as complete as possible; so that stock and goods exhibited may not be injured, and may be seen to good advantage. It is essential to the success of the fair that it should be held in some large enclosure, and if this is not at hand it must be extemporized with a high board fence. This, the lumber merchant or builder will attend to on contract. It is desirable that shelter should be provided for stock. Owners will not exhibit freely, and for succes-

sive days, unless their cattle can be made comfortable, and be well supplied with water, hay, and provender. A large tent will answer for the exhibition of fruits, vegetables, butter and cheese, but a building is better. The society should look forward to permanent grounds and buildings, and realize them as soon as possible. The starting of a County Agricultural Society involves a good deal of labor and expense, but it will pay a hundred fold. A few energetic men, in any county with ten thousand people, can accomplish it. It will aid their enterprise, if they sprinkle liberally among their premiums some good paper devoted to their art, like the *American Agriculturist*. CONNECTICUT.

Buildings for Agricultural Fairs.

At a recent meeting of the Connecticut State Board of Agriculture, the fact dropped out that there was but one County Agricultural Society in the State, that had permanent grounds and buildings to accommodate stock, and all classes of goods offered for exhibition; and that was the most flourishing of all. Is there not a logical connexion between the buildings and this success. We think the importance of permanent buildings is greatly overlooked. We regard the housing of an Agricultural Society as essential to its success as the building of a church edifice is to the prosperity of a church. It may dwell in tents for a time as a matter of necessity, but it is never assured of a permanent existence until it has a home. Permanent buildings are an expression of the faith of its founders in its vitality, and impart confidence of its success to the community in which they are placed. It is a living power among them, and invites their co-operation.

These buildings should be located at some central point in the county, or near some city or village easily accessible by rail or steamer. This, with a good exhibition and good weather, will secure a large attendance. The people will come if the place is easily accessible. Such a location also materially affects the character of the exhibition. Most railroads will, on application, carry stock, farm products, and goods for the fair, at reduced price, or free of charge; relying upon passenger tickets for their profits. This, of course, is an inducement for people to bring out their products.

The buildings need not be of an expensive character, but substantial and neat; affording perfect protection to all goods and stock entrusted to the care of the Society. When there are nothing but tents or temporary buildings, goods are frequently damaged, and though the owners be remunerated, it always operates disastrously to the Society. The community want entire confidence in the managers of the Society, and the assurance that everything will be properly cared for. Articles like paintings, and heirlooms of various kinds are frequently exhibited, and they have a value to their owners much beyond what they would bring in money. People who have the best articles to exhibit, will not forward them, unless they have security for their protection against damage from the elements.

Stock of all kinds want protection in permanent sheds or stalls. It is found to be desirable at most country fairs to have the exhibition continued through two or more days. This arrangement gives not only a better opportunity to examine the animals, and to see the various products of the farm, but affords a very important safeguard against failure from bad weather.

If one day should prove stormy, and forbid attendance, the next may be fair, and draw the crowd. With good accommodations for stock, the owners of fine animals, who are raising principally to sell, will have no objection to exhibit a second or third day. They can be made as comfortable at the fair as at home; and the more they are known the better for the owners' interests. If there is no shelter, and provisions for feeding and watering are bad, it will be difficult to get them out.

Permanent buildings are the capital that an Agricultural Society needs to do business with; and immediate measures should be taken in every county where there is a Society to secure them. Wisely managed, they would pay for themselves in a very few years, and make the prosperity of the institution permanent. We will thank any of our friends for drawings and descriptions of suitable inclosures and buildings for the use of county or other agricultural fairs, with estimates of their cost.

Shall we have the Address at Fairs,

That depends entirely upon the character of the address. If the speaker is a distinguished politician, who will improve the occasion to air his views of the political situation, and talk buncombe, it won't pay. If he is a reformer, or monomaniac, who will trot out his favorite hobby, and show off his antics, his services may be dispensed with. Farmers and their wives come together on such occasions to learn something about their business, and unless the speaker has some experience in their calling, he should take other occasions to dispense his wisdom. There are men in almost every county who have studied the principles of husbandry, and practiced them so far as to make them intelligent critics of the practice of others. Sometimes the members of the learned professions have given special attention to the farm and garden, and can give a good address. Whoever is invited should have something pertinent to say, and be invited for that reason. If the address is not at hand, an "experience meeting" of farmers and fruit growers should be provided for. A few practical questions offered for discussion will draw out the views of farmers from all parts of the State or county, and make the meeting one of great interest. Every one who comes to the fair should have the memory of things heard, as well as things seen, to carry home with him.

BREEDING YOUNG MARES.—"W. M. B.," of Nelson County, Virginia, asks: "Does breeding stop the growth of a young mare, that has not attained her full size, or does it materially injure her in any respect?"

The best horse breeders hold, we believe, with few, if any, exceptions, that having a colt not only does not hurt a young mare, but, on the contrary does her good, gives her constitution, bottom, and a vigor of digestive organs, and firmness of muscle, which last her through life with good treatment. Thoroughbred or warm blooded mares that have proper care, gain sufficient maturity at 2 to 2½ years, and cold blooded mares 3 to 3½, to take the horse. Of course, the fillies diet should be liberal, and regular, and her grooming thorough. For two growing horses stand at her rack. Thoroughbred horses arrive at maturity fully a year earlier than others. They grow faster, are fit for work quicker, and, as stated, are not injured by breeding considerably earlier, than it would be safe to breed a common mare.

Country Houses with City Conveniences.

It is generally supposed that city houses are far more convenient than country dwellings. Servant girls lay special stress upon this, when asked to go to the country. But, with the single exception of gas-light, every city convenience may be equally well secured in any country place. To illustrate this, and also to furnish good house-plans, we present engravings and descriptions of some houses now being completed in Flushing, eight miles distant by Railroad from the Hunter's Point Ferry, opposite 34th-street New-York. These houses, by the way, are almost as quickly reached, and with far more comfort, than any city residence above 40th-street, while they are in a healthful location, and have the benefit of country air, the pleasure of a garden, etc., and, being supplied with gas from the village, they have *all* the conveniences of city houses. The proprietor, in their erection, has attempted to introduce every improvement, and to construct every part as if to be occupied by his own family. (The general superintendence and carpenter work,

Fig. 6. is done by John Donald; the mason work by James & Patrick Carroll; the painting by P. Thornton; the tin-work by Benj. Field; and the slating and roofing by J. S. Mosely, of the Union Roofing Co., of New York.)

ELEVATION.—Fig. 1 shows the general appearance from a front corner view. The basement walls are 3½ feet stone-wall below the surface, and 4 feet brick-wall above, cemented and laid off into stone blocks. The siding is of 10-inch boards, half-tongue and lap, with a *v* groove at the lap, and another *v* groove cut along the center of each board, giving it the appearance of 4½-inch siding, an end section of which is seen in

Fig. 6. This new style of siding is the finest and best we have seen. The roofing is French, or half French style, the fronting all round covered with slate, black (B), green (G), and red (R)—as shown by these letters in fig. 7. The top part on one house is tin, and on the others, H. W. Johns' Patent Roofing. The window caps and cornices are alike on all sides, which gives almost a front view, when seen from any direction. The walls are filled in with brick, from cellar to roof.

FIRST FLOOR (Fig. 2).—The Parlor A, B, with Bay Window at O, is divided by sliding doors, so that A, 14×20 feet, can be used for the parlor,

for cloaks, umbrellas, etc., leaving plenty of room for a hat-stand between that and the parlor door. N, is a covered piazza. C, is the general family room, or sitting-room, or may be used as a Dining Room, when D, is used as a Kitchen. D, is the Dining-Room, but is provided with a medium size cooking-range at J, so that for a small family, or with a scarcity of help, or at special seasons of the year, D may be used as a Kitchen. I, is a common Dish closet, and K, a China closet, with doors opening into both D, and C. By the side of this is D, W, a dumb-waiter from the room below, which, when not in use, shuts down even with the floor, and occupies no room. The Sink in the corner is neatly enclosed, with a door to open to its front. G, is a rear hall extending out to a small piazza and steps. Under this at the left, is seen the outside entrance to the Basement. A closet from G, furnishes a place for hats, garments, umbrellas, etc. P, is a general pantry and flour room for D. Ventilators, throughout the house, are placed in the base-boards of the rooms, in accordance with the principles explained in September *Agriculturist*, 1864. The suggestions

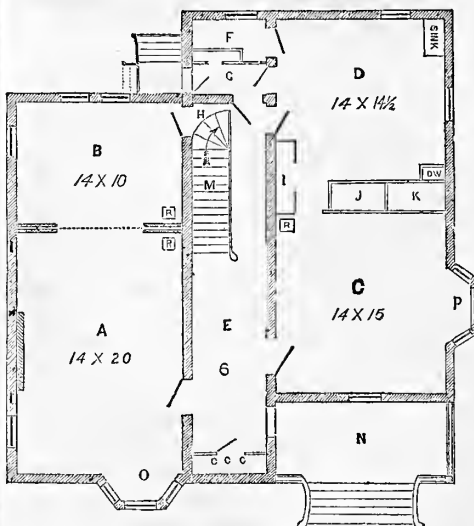

Fig. 2.—FIRST FLOOR OR GROUND PLAN.

published in this journal for several years past, have been consulted in constructing these houses.

SECOND STORY (Fig. 3).—Q, R, are front and rear chambers, with connecting closets, s, s, and a double door passage containing drawers and shelves. U, is the family chamber or bed-room, connected with W, and with the hall bed-room, T, so that a child, sick or well, occupying either W or T, will be in hearing and easy reach of U. This room, U, is specially fitted for the convenience of the lady of the house, even if she be

and B, 14×10 as a Library or Sitting-room; or the whole be thrown into one large parlor when desired. A, is spacious enough except for large gatherings. The Main Hall, E, is six feet wide. Many err in making this too narrow; it is the first room entered, and its capacity gives the first impression in regard to the whole house. At the front is a small closet (c, c, c.)

an invalid. The wash-stand and basin, E, E, has cold and hot water brought to it by pipes from the Attic reservoir, and the basement boiler (I, fig. 4). A bell wire extends to the servants' room on the third-floor. One speaking-tube extends to the basement Kitchen, and another to the Dining-Room (D, fig. 2), so that the lady can give directions to those rooms without calling through the halls. We commend this arrangement to every housekeeper. A small sum will connect two distant rooms with tubings so that free conversation can be held, and thus *save a great number of steps*. The lady, while dressing herself or children, can give full directions to the kitchen or dining-room, and make inquiries. From this room, U, another speaking tube extends to and opens over the outside front door bell-knob, so that in case the bell is rung at night, instant inquiry can be made of the caller as to "what's the matter," without a long journey through the halls. Such a tube should at least extend from every Physician's sleeping-room to

Fig. 3.—SECOND FLOOR OR CHAMBER PLAN.

his door-bell. The tubing costs but 5 or 6 cents a foot, and is easily put in, along the corners of rooms, or, as in these houses, behind the lathing, when done at the time of building.... W, is another bed-room, large enough for two beds if desired.—X, is a bath-room, with wash basin, S, and bath-tub, B, T, both of which are supplied with cold water-pipes from the Attic reservoir, and hot water from the boiler tank in the basement.—A water closet here is supplied with water from the Attic, and with a large waste pipe running underground to the privy vault, at the end of the grape arbor which extends back from the rear door. The closets A, A, Z, D, C, D, C, are shown in the plan: there can hardly be too many of these, as every housekeeper knows.

BASEMENT (Fig. 4).—K, is the Kitchen, supplied with stationary wash-tubs, w, w; sink, w; force-pump which draws water for the Kitchen from a large cistern outside, which is filled from a filtering cistern. This pump is connected by a pipe with the Attic reservoir, so that if in a long drouth that should fail, it can be refilled from below, and thus a supply of water and pressure always be secured to the hot water tank. K, is supplied with a large "Challenge" cooking-range, J, having a water back and a large tight thirty-five gallon boiler, I, seen at the left, which is kept filled and under pressure from the Attic reservoir.—H,

Fig. 4.—BASEMENT.

is the coal cellar, receiving coal directly from the cart. *R*, is a large Sanford & Truslow's Heater or furnace (with extra evaporating pans), which sends warm air to nearly every room in the house, including two Attic rooms and the bath-room. (An opening over the bath-room admits warm air enough to the Attic reservoir to prevent its freezing in very cold weather.) *R*, *R*, *R*, indicate the warm air registers from the furnace, shown in several of the rooms.

ATTIC OR THIRD STORY (Fig. 5).—This is 8 feet high, the full size of the house for 4 feet high, then inclined inward at the sides, under the slating. Two Rooms, *B*, *B*, are finished off; the large room *D*, is also lathed and plastered, and furnishes a convenient place for drying clothes, storage, and other purposes; or if

Fig. 5.—ATTIC.

needed, it can easily be divided into several rooms. The 8 dormer windows furnish abundant light and air. The Reservoir, *T*, is of plank, lined with tinned lead, 8 × 8 × 4 feet. All the water from the upper roof runs into this reservoir, and when full, it overflows through a pipe down to the filtering cistern.

PAINTING, COST, ETC.—The outside color is light drab, with dark trimmings; the doors throughout the house, inside and out, grained Walnut; the parlor and chamber above white; the halls, sitting, and dining-room, etc., grained in oak; outside of all sashes, dark green; inside grained to match the rooms. Every room from cellar to attic is supplied with gas pipes, built in the walls.—Without the land, the cost of such a house at *this* time, all complete as here described, is from \$5,000 to \$7,000, according to the locality, expense of lumber, bricks, etc. This includes all the fixtures named—the furnaces, double cooking-ranges, extra style painting, plumbing, fancy slate roofing, drainage, waste pipes, double filtering cisterns, grape arbor, front fence, etc.

Coal Tar and Asphaltum for Floors.

By GILBERT J. GREEN, HUDSON, N. Y.

A floor properly made of Asphaltum or coal tar, or both combined, so far surpasses all other floors for stables, that it has but to be seen to be generally adopted. The cheapness of these floors, their ease of construction, durability, freedom from moisture, and their cleanliness, recommend their adoption by all good farmers. The way in which I have constructed floors for cow or horse stable, as well as floors for barns, carriage house, poultry houses, pig pens, or other out-buildings and barn-yards, is about as follows, varied somewhat to circumstances.

I first prepare the floor by removing sufficient earth to allow coarse sand or gravel to be laid upon it to the depth of about two inches, this gravel or sand should be free from clay or other earthy matter, and be perfectly dry, by being exposed to the sun, or dried over a fire. If it is summer time, and the floor or stable will not be needed for immediate use, I would use nothing but coal tar, boiled in a kettle from fifteen minutes to half an hour, this I pour upon the gravel hot, and leave until it is cold, I then mix fine dry sand with hot coal tar, to the consistency of thin mortar, and spread it over the floor to the depth of half an inch, I then take a hot smoothing iron, holding it with a pair of blacksmith's tongs, and iron it down smooth. If it can re-

main twenty days without being used, in warm weather; it will make a hard solid floor, that may always be kept clean and dry.

If it is desirable to use the floor at once, I would use one-half or two-thirds of Asphaltum and the remainder coal tar, this can be used the moment it is cold, but it lacks the strength and elasticity of a floor made wholly of coal tar, still I have known pavements made wholly of Asphaltum and gravel that have endured many years of severe use, and are still good.

The cost of such a floor with Asphaltum or coal tar at eight cents per gallon, (the usual price), will be about three cents per foot, about half the cost of plank, with the floor timber included. It will last longer than any hemlock floor will in a stable, and can be much more easily repaired.

A floor of Asphaltum or coal tar, like a piece of India rubber, neither attracts or absorbs moisture, and is therefore easily cleaned and always dry. The edge of such floors should be protected by a joist or piece of timber, so that it will not be broken off by cattle's feet nor wheels of wagons. It is equally useful as a floor for pig pens, or any out-buildings, and I believe it superior to stone or brick for sidewalks. It is smooth but not slippery! Hard, but still sufficiently elastic; the sun does not injuriously soften it, and frost will not injure it. For pavements or floors where heavy loads will pass over it, it should be thicker than above recommended, or else the earth beneath it should be very solid.

Fig. 1.—SECTION OF HEN HOUSE.

A Good and Cheap Hen-House.

We have an urgent appeal to publish a plan for a cheap Fowl-house, "with all the modern improvements." Modern improvements are *costly* as a rule—but nevertheless we may have a warm, snug hen-house, which should be neat and convenient, and yet not be very costly. The accompanying plan is used with entire satisfaction by an acquaintance, who is so particular in his views, that we may safely commend it to our readers:

The house is 10 feet wide and 12 feet long; a passage-way 4 feet wide passes along the south side, in which are windows; this is formed by a partition 3 feet high, (see fig. 1), which extend from near the door to the rear, and supports the lower side of a sloping floor, which rises to the eaves on the north side. Above this sloping floor the roosts are fixed and the droppings of the birds fall upon the floor, which being sprinkled with plaster, they roll down, or are easily scraped off. There is a ledge at the front edge which prevents their going to the floor. Under this sloping floor the space is divided by a partition, making a nest room about 6 feet square and a setting room 6 × 5 feet, which is also used for a store room for grain, eggs, etc. This setting room is entered by another door, and light

ed by a pane in the gable end. The nest boxes shove through the partition into the setting room, but there is no access for the fowls, except when setting. At these times hens are moved, if

Fig. 2.—PLAN OF HEN HOUSE.

they happen to be in boxes against the side building, and made to occupy those in the partition. The back end of the 4-foot passage-way, (see plan, Fig. 2), is used as a feeding floor, and here stands the water fountain.

We made once a small hen-house, and lighted it by placing some of the roof boards, which went up and down, ten inches apart, and fastening 8 × 10 glass between them, slipping the glass into the grooves in the boards, which were common flooring. The panes lapped about half an inch, were fastened by tacks, and little water came through. Windows in a fowl-house must be protected by slats or by wire. The use of plaster on the sloping floor under the roosts is very well—nothing can be better; but fine, dry road dust, swept up on a hot day, is as good.

Simple Farm Gates.

There is almost no end to the devices for farm gates, but after all the simplest, strongest and lightest, of the old better patterns, are the most reliable, and, on the whole, the best. The posts should be of locust, or cedar timber, if possible, and set very firmly, being securely braced either above or under the ground, and protected by coal tar beneath the surface, and by paint above, from the action of the elements. The long, hard-wood latch, in common use, is probably the best for all kinds of farm gates.

A LIGHT FARM GATE is described by W. S. Gilchrist, Warren County, N. Y.—"I send you the plan of gates which we have had in use for the past ten years, and for that time have never, *with the aid of paint*, required any repairs. My experience proves that the lighter a gate can be made, the longer it will last, besides being much more convenient in use. I, therefore, use well seasoned pine lumber (cedar if to be had); the hinge-piece (*a*) and latch-piece (*b*) of 3 × 3 scantling; the rail (*c*) 3 × 3 also, tapered to 2 inches; the slats of 1½-inch seasoned pine or, if to be had, cedar, by all means avoiding the use of green or heavy lumber; the braces of good clear

LIGHT FARM GATE.

stuff, and straight grained lumber, 1 × 1½ inches, of any description; the whole securely nailed or pinned. Any one of ordinary mechanical

skill in the use of tools, should be able to build a gate after the accompanying sketch."

Fig. 1.
FRAME GATE.

FRAME GATE.—Seth Clark, of Wellsboro', Pa., writes, "I have made several gates of this kind for myself and my neighbors, and they give general satisfaction. Figure 1 represents the gate and the frame in which it hangs (which should be a little wider and higher than the barn doors). The cross piece (A) may be made either straight or slightly arching, and in either case is mortised upon, and braced, as shown, into the posts. The posts (B) (5×5 studs) are framed into sills, as seen in Figures 2 and 3,

Fig. 2.
Fig. 3.
BRACED POSTS.

which effectually prevents a tendency to lean to either side. The hinge-piece (E) of the gate rests on a pivot inserted in the sill (Fig. 4), which should be wide enough to receive the post and hinge-piece without crowding. The upper hinge is of wood, and is shown in Figure 5. Figure 3 shows how the posts are framed and braced on sloping ground, which does not interfere with the gate if it swings open down the slope. The long braces of the gate (C and D, Fig. 1), are placed on opposite sides, and the gate is made very light. The gate may be hung upon iron hinges if preferred. Such a frame will last as long as the best posts set in the ground, and has the advantage of being always erect."

An excellent gate is one framed much like this, except that the cross-piece (A) is straight, and instead of being at the top, is three feet from the bottom of the posts, and well beneath the surface of the road, being strongly braced into the posts below, they being set a little more than three feet in the ground. The posts extend five feet above the ground, and the gate is hung to them in any desirable way. The hinge-piece of the gate, if hung as above described, should rest on a block, pinned to the post and resting upon the cross-piece. A gate made after this plan is very convenient and firm.

FALL PLOWING TO KILL GRUBS.—"H. E. H." writes, "I am turning over a heavy sod (in December), to kill grub-worms, so that they will not destroy my corn, next June. Will I accomplished the object? Is fall plowing ever an injury to the soil?" You will probably dis-

turb and kill a good many grub-worms. Your corn will not be so weedy as if plowed in the spring. And the fall plowing will have done nothing but good. A very light sandy soil naturally dry and warm is not benefitted by fall plowing—for the frosts and weathering cause the organic matters in it to decompose rapidly, and these are essential to its integrity, but all loamy and clayey soils, or those rich in organic matter, and most gravelly soils are decidedly benefitted by fall plowing, if it be not done when the ground is wet, and even this is much less injurious than plowing wet soil in spring.

Building in Cold Climates.

The house room of all sorts should be contained within four walls for this (unless it be an octagon or some other *gon*), gives the most room per foot of wall, admits of the most thorough warming, and the least radiation of heat into "universal space," there being the least outside surface for radiation; and the advantage is as decided in summer, for then there is the least surface for absorption of solar heat. There should be as few windows and doors as possible on the north side, and few on the west side; and on those sides should be the halls, pantries, and other small rooms, and the wood-house apartments, to serve as air-chamber bulwarks between the north-western winds and the living rooms on the south side, where the sun brings light, heat and health. Cistern, cistern-pump and drain should never be on the north side. Outside walls should be lathed and plastered between studding, as well as on the face of it; the economy of double walls is great, in the course of time. The cellar wall should be lathed and plastered from sill to a lower level than outside surface of the ground. Keep a sharp eye on carpenters, lest they fur out the outside base or drip-board, in a way to let the wind blow up behind the siding. Finally, front the house east, so that the front verandah may be shady in the afternoon for out-door sitting in summer, and so that the sitting-room, back of the parlor, may have a sunny outlook in winter. H. W. P.

Cranberry Culture.

Mr. Gilbert Conant, of Ipswich, Mass., received a premium from the Essex Agricultural Society for his success with cranberries. We give the essential portions of his report, which is somewhat peculiar, as it describes a method of growing cranberries without setting the plants. This can, of course, be useful only in localities where cranberries grow spontaneously, but it shows how a natural and unproductive patch may be converted into a cultivated cranberry meadow.

"In the summer of 1861 I prepared about an acre of meadow, by cutting a ditch to drain it, and in the fall I plowed it from four to six inches deep, according to the height of different parts of the meadow. Since then I have flowed it annually about the first of November, and let the water off about the first of May.

"The first summer after preparing the meadow as stated, vines sprang up and grew considerably on the lowest parts of it. The second summer the vines increased and grew rapidly. In the fall of that year I gathered about a half bushel of cranberries. In 1864 the vines blossomed full, and after the berries were set, gave promise of a fine crop; but an early frost, while they were quite green, injured them so that I gathered but about a bushel. In 1865 the vines had increased in some spots on the meadow, so that

they had almost killed out the grass, and in the fall, when the berries were ripe, they lay so thick that the vines were scarcely visible. I gathered twenty bushels of cranberries, worth three and a half dollars per bushel. The expense of gathering and marketing these berries was less than ten dollars. This year there are but very few cranberries in this section of country, though my vines are bearing better than I have seen any others on fresh meadow.

"The expense of draining this meadow was nothing. The peat taken from the ditch paid the expense. It cost me but \$5 to flow it. This was done by a small flood-gate at the bridge. I spread upon the ice in the winter of 1863 two loads of yellow sand, which cost but \$2.50, making the whole amount that it has cost me to prepare the meadow, but \$7.50. I would here state that the vines on the spot upon which the sand was spread were far more prolific last year than any other vines upon the meadow.

"I have had experience in preparing several other pieces of meadow in the same manner, for the cultivation of the cranberry, and in every case have been successful. I neither plant vines nor sow the seed. Whenever any meadow adapted to the cultivation of the cranberry is prepared in the manner that I have prepared mine, vines will spring up and bear spontaneously."

John Johnston on Drainage.

In a recent letter this pioneer of drainage says: "I commenced in 1838, and have drained 280 acres, laid over 200,000 tile. Drains should run directly down the slopes. You never can make thorough work by running them across the slopes. My drains are from twenty-five to perhaps forty feet apart—very few of the latter, generally about thirty-three feet. In soft soils, and where you have to go four feet deep and lower, before getting on hard bottom, drains might be fifty or sixty feet apart, and dry the land perfectly; while in stiff clays, eighteen or twenty feet may be rather too wide. I estimate that the excess of two wheat crops on drained land will pay the whole cost of the improvement. I took up the first drain after twenty years, and found the tile as good as ever. Although I paid twenty-five cents a rod, and board, for digging some of the drains, two and a half feet deep, I got the great majority dug at twelve to fifteen cents per rod, without board. The lateral drains need not be over thirteen inches wide at the surface, and wide enough at the bottom to take in a two or three inch tile. Main drains cost much more." We must add that, however much we value John Johnston's experience, 2½ foot draining is considered too superficial to be ever recommended if one can go lower.

Garden Irrigation, How Practised.

BY "TESUQUE," NEW MEXICO.

The subject of irrigation has of late attracted considerable attention in parts of the country where it is not, as it is in New Mexico, absolutely essential. The following article, prepared at our request by a gentleman living near Santa Fe, gives very clearly the plan of irrigating a garden as practised in that country. The writer promises to resume the subject, and we hope to be able to present the details of operations upon a larger scale.—[EDS.]

I submit a few general principles, as practised here, in the hope of seeing in your paper some hints by which we can improve upon our present system. But, before I venture farther, I

would advise those who make a practice of keeping their land clean *only* where it is planted, and of allowing fence corners, etc., to raise their own crops of weeds, not to irrigate, because, if they do not keep their ditches and all water avenues clean and free from weeds, they will assuredly bring such crops upon their land every time they water it, as will soon disgust them with the whole system.

The first thing to be done is to get the water to the highest part of the land to be cultivated. Here this is done by communities; each community having its own peculiar by-laws as regards compensation of the Major domo, division of the water, etc., all being governed by the general laws of the Territory as regards the election of the Major domo, and the fines for delinquency in working the "Ascequias," as the canals are called, or for stealing water, &c.

The advantages of irrigating by open ditches are many; principally, that you get your water on the land at a much higher temperature than from a well. I have seen persons here, when short of water, use their wells, and give their crops of cucumbers, peppers, tomatoes, &c., such a "back-set" as often to lose the whole crop. We are here 8,000 feet or more above the sea level, and have to take the greatest care as regards the temperature of the water and the time for irrigating, or it would be impossible to raise any of the more delicate vegetables. Again, by ditches, if well made at the outset, the advantage is that they are *always there*, whereas if one has complicated machinery it is liable to be out of order when needed, and before the repairs can be made the good time has gone by.

In preparing for irrigating a garden, which can be laid under water from one line, as in figure 1, run the main ditch as near level as possible, because, as the water has to run in this ditch to feed all the smaller ones, it will cut away, if sloping, much more than the smaller ditches. Those ditches which slope much should be well paved or lined with plank. In figure 1, A, B, C, D is a plot of ground having a slight fall from B to A, and a greater fall from B to D, the lowest point being at C; m, the main ditch, entering the plot at B and leaving at A; c, c and c are the cross ditches, num-

get the upperhand while he is repairing borders. This ditch, to a practiced irrigator, is almost unnecessary, except in cases where neighbors above him, using from the same stream, may let all the water upon him without warning; but, in any case, it is better to have it, as it can

Fig. 2.—MANNER OF LETTING ON THE WATER.

be used also to irrigate the right hand row of beds. The points where flood-gates are necessary to regulate the amount of water are marked *f*; *w* is a walk, bridging the cross ditches at the points *b*, which must be enlarged or added to according to taste or convenience; but all walks or roads should be made on a level with the border above them, and in fact serve to form the border, as they give strength to the beds. *o* is a continuation of the ditch; *n* serves also as an outlet for the water when one tier of beds has been watered, until the next tier has been started. The same principle marked in this plot will apply equally to a garden of fifty acres or more, and the larger the garden the more will the labor be lessened by following some such system.

Now, let us suppose the main ditch dug, and water running through it: the first thing will be to make the upper row of beds (marked 1); commencing on the right hand, make the first bed; of course the land has been ploughed well long ago. For vegetables of most kinds, no bed should exceed ten feet by twenty, and before the first season is over the gardener will find that,

by making small beds, he has saved much labor. The first line of beds is made with borders, or raised margins, from six to nine inches above the level and at least six inches across the top, and the cross ditches finished down to the lower edge of the completed beds. The next thing is to ascertain that they are perfectly level, and this is best done by opening them, as in figure 2, and letting in the water *slowly*, and if there is a corner higher or lower than the rest of the bed the water will surely find it for you. Leveling the beds well previous to planting is absolutely necessary, for if you have to irrigate very young plants (which, in

many cases, will give them a two weeks' start over those left later), and the beds have not been exactly levelled, some of the plants will be drenched or covered with sediment, while others will get no water.

While beds No. 1 are filling you can be making the next row, and so on, until your plot is

all terraced; and if, wherever the fall increases, the beds be made narrower, much labor will thereby be saved. Next put in the flood-gates, (see figure 3,) and sink boxes in the cross ditches, at the points where you open the beds, or make holes and line them with brick; these

boxes, or holes, are so placed that when the border of a bed is opened for irrigation, the water has to run over the hole to get into the bed, so that all sand which would otherwise go into the bed is caught; and whenever these holes fill with sand before you have water enough in the bed, clean it promptly. It is better, where the lay of the land will admit of it, to water the beds from the lower corners. But always commence to water those beds which are the highest, so that if a border breaks the water will run into a dry bed; whereas, on the other hand, if you commence at the lower beds, and the same accident should occur, the water runs into beds already full, and may burst a dozen borders before you can stop it. Another reason for ir-

rigating from the top beds is, that while one bed is filling you can open as many below as you choose, and in this way you are ahead of your work, always ready to spare a few minutes to remedy any accident, and also have perfect command of the water.—When the plants are strong enough to allow of a good stream being used, one man can, in this way, easily water from 150 to 200 beds in a day.

In figure 2, is shown the method of letting on the water. First, break the border of bed 1

Fig. 3.—FLOOD GATE.

at the point *e*, throwing the soil across the cross ditch *c*, so as to form the dam *d*, then open the floodgate marked by the dotted line *f*, until the amount of water needed passes; and if the whole of the water running in the main ditch, is used, shut the flood-gate in *m*; but if not, open all the flood-gates on the main ditch enough to allow the surplus water to pass on. Now, while the first bed is receiving the water, open other beds in succession, as indicated by 2, 3, and when the first bed has received sufficient, draw the first dam over again to its place in the border, and allow the water to flow into the next bed, and so on to the end of the work; always taking care to keep your boxes (*b*) clean, and never leave any of the beds open to the ditches when not irrigating. This is a slovenly fashion, and often from a heavy rain, or by the leaking of a flood-gate, is the means of ruining the beds so left, and of course the plants they contain.

Figure 3 shows the flood-gate in general use here; it is a square box, open at the top, except the braces for strengthening it, with a door sliding between cleats nailed on the inside and bottom, and having a frame (*f*) through which the handle slides, and which is bored so as to be fastened at any height by a peg or nail. It is set in its place so that the end (*a*) at which the water enters shall be a little below the level of the ditch, marked by the dotted line *l, l*. By this means the water is not so apt to lift the gate out of place, and it also catches much sand, and so helps the boxes in the cross ditches.

Fig. 1.—PLAN OF IRRIGATION.

bered in the order in which they would be used when irrigating the whole plot; *n* is a ditch of the same size as the main ditch, and is used for running off that part of the stream which is surplus when irrigating; it is also used as a channel for the whole stream when breakage occurs, and the gardener has fear that the water may

[COPYRIGHT SECURED.]

SQUIRRELS OF THE NORTHERN AND EASTERN STATES.—*Drawn and engraved for the American Agriculturist.*

A Squirrel Congress was probably never convened, and so, in all likelihood, no such committee-meeting was held as our artist has represented. Of all hard things to draw and engrave, one of the most so is a squirrel's tail,—so light and airy, and graceful and thin, and delicate,—each hair distinctly banded, of two or three colors, and all, one moment in elegant confusion, and the next, jerked into the most precise order. Our artist, we have no doubt, agrees with us. This beautiful group represents the common American species of this family.

The squirrels of our northern woods are the following: The Great Gray Squirrel, called also Cat or Fox Squirrel (*Sciurus cinereus*); the Common or Little Gray Squirrel (*Sciurus Carolinensis*); the Black Squirrel, a variety of the same species; the Red Squirrel (*Sciurus Hudsonicus*); the Flying Squirrel (*Pteromys volutella*), and the Striped Squirrel or Chipmunk (*Tamias Striatus*). The two species of Gray Squirrels are much alike, except in size, the Great Gray being much heavier, more robust, having a broader head. The color of the Little

Gray Squirrel varies greatly, it being sometimes red, and again becoming quite black, so that the variety was long regarded as a distinct species.

The squirrels are so familiar to our readers that a particular description of them would be unnecessary, even had we space, and we might easily fill this number of the *Agriculturist* with the accounts of different kinds; for, besides those we have named, there are several other distinct species inhabiting the United States.

These lively, agile, and beautiful denizens of our forests, retreat reluctantly before the approach of civilization, and most of them need only a little encouragement to become familiar as door-yard pets. They are all easily domesticated, and are playful and mischievous. The Gray and Black Squirrels retreat together to the mountains and thick woods from near settlements; but the Red and Striped ones remain in the stone-walls and open woods, and even in our barns and granaries, when not driven off.

The introduction of squirrels into city parks and pleasure-grounds of late years has been productive of much gratification; but these pets are

destructive to the birds, whose eggs and young they devour; they eat also the buds of trees. They are on the whole undesirable, and cannot be recommended as useful tenants of such places, except in the midst of large cities, where birds are at best only occasional residents.

The Flying Squirrel is one of the most interesting of our quadrupeds. Possessed of all the other powers of its family: climbing, running, jumping from limb to limb and from tree to tree, as freely as any of them—it has another distinguishing peculiarity—namely, that of flying, or, more properly, sliding on the air from one elevation to a lesser one. In these flights it is supported by the thin double skin, which is stretched between its fore and hind legs, and no doubt also by the broad tail. This species is perhaps more easily domesticated, and more gentle, docile and affectionate than any of the others. The extreme length of the different species of squirrels is as follows: Large Gray, 24 to 26 in.; Little Gray and Black, 20 to 23 inches; Red, 13 to 15 inches; Chipmunk, 9 to 10 inches; Flying Squirrel the same size or a little less.

Oranges North and South.

The climate of the Gulf States is so well adapted to the culture of the Orange and its relatives, that it is probable this will become, before long, an important branch of horticulture in that portion of the country. In some parts of Florida the bitter Orange has become so thoroughly established that it forms natural groves, and is there known as the "Wild Orange," producing a yield of a bitter and sour fruit, and affording an abundance of stocks upon which to graft the finer kinds. Sometime ago, Doctor C. J. Kenworthy, an enthusiastic traveler and horticulturist, brought us a collection of the various oranges and lemons from the St. John's River, Florida. The Sweet and Mandarin oranges were of excellent quality, and the specimens of the wild variety were so remarkably fruitful—as many being placed upon the stems as they would hold—that we had an engraving made of one of the branches, somewhat reduced in size. — Doctor K. has furnished the following notes upon their cultivation: "I have tasted fruit from almost every orange producing country of the world, and for size, thinness of skin, amount of juice, and richness of flavor, I have never met with any to equal some I gathered during a visit to the banks of the St. John's River, Florida. I arrived at the conclusion that (independent of climatic influences), soil and manure had much to do with the superiority of the fruit. The soil where they attain the greatest perfection is light and sandy, closely resembling that found in many of the poorer portions of New Jersey. The only manure used, is a remarkable depos-

it found along the banks of the St. John's River, and known as 'shell bank.' These deposits vary from a few inches to several feet in thickness, and consist almost entirely of the remains of snail shells. This deposit contains a large amount of calcareous and animal matter in a decomposed state, furnishing an ample supply of food for the nourishment of the tree. About once in four years, a bushel of 'shell bank' is forked in around each tree, and I was surprised at the deep green of the leaves, the luxuriance of growth, and the size of the fruit. I neglected to measure the oranges, but one of the lemons from the same locality, left at your office, measured five and one half inches in length, and eleven inches in circumference.

"The soil generally used as compost for the orange tribe, when grown in pots, is composed of loam and rotten dung, and it is but seldom that we see a healthy plant under green-house culture. I am of the opinion that the cultivator of the orange tribe in pots should test light

silicious soils, and use a manure containing an excess of calcareous and animal matter. In Florida, where the wild orange attains its greatest perfection, the soil is always light, and the trees are usually shaded by the evergreen oaks."

The orange affords a remarkable instance of

ing house, where its cultivation is often attempted, it seldom succeeds. Since the introduction of the modern methods of heating and lighting our houses, we now seldom see, as we formerly did, fine home-grown specimens of orange and lemon trees. They cannot endure a hot and dry atmosphere during the winter. They should be kept where they will not freeze, have very little water, and be kept clear of insects until spring. As soon as the weather is mild enough they may be set out of doors, and sheltered from the wind.

Concord and Discord Among Grapes.

When the "Greeley Prize" for the best grape for general cultivation was awarded to the "Concord," we supposed that the business was ended, and that the folly of a few men, some of them not particularly interested in grape culture, attempting to decide upon one grape for a wide extent of country, embracing almost every diversity of soil and climate, would soon be forgotten. Had we been on the committee, with the imperative necessity of finding a verdict, we should, perhaps, have done as they did; but we hope never to be placed in so useless a predicament. To see the folly of any such decision upon any one fruit, one has only to compare, one year with another, the proceedings at the annual meetings of the Ohio, Indiana, Illinois, or any other live State Pomological Societies. At these meetings a large share of the time is occupied in the revision of the fruit lists for one State only, and we find that the status of such generally cultivated fruits as apples and pears is very difficult to fix. A large State like that of Illinois is divided into three fruit re-

gions, as those varieties suited to one extreme fail in the opposite end of the State. In some grape regions, the distance of a mile or less will make a difference of one or two hundred dollars an acre in the price of land, because some is favorably situated for grape culture and other is not. Now, can it be possible to fix upon one grape, one apple, or one pear, that will do everywhere? And can there be a more unfortunate position in which to place pomologists who have a reputation at stake? When we announced the award of this prize, it was stated that it would cause much dissatisfaction, and the same would have been the result, no matter what grape had received it. Already we find discussions in the various journals, and conflict of opinion as to the justice of the award and the merits of the Concord. A marked illustration of the different views taken by people living not only in the same State, but in the same County, has just come to hand. At the meeting of the Warsaw (Hancock Co., Illinois) Horticultural

CLUSTER OF WILD ORANGES.

the production of several different odors, or flavors by the same plant. The leaves are aromatic; the young fruit, when of the size of a large pea, furnish a very strong and different flavor from that of the leaves; the character of the oil contained in the rind of the ripe fruit is well known, and the odor of the flowers, still different from either, is among the most highly prized perfumes. So beautiful and fragrant are orange blossoms, that we often find the tree in cultivation at the North for these alone. In a cool green-house, suited to camellias, there is little difficulty with the orange; but in the dwell-

Society, the Standing Committee on Grapes made a report, in which they say:

"The Concord not only keeps its place in public favor, but is gaining ground every year. The Committee congratulate Dr. Warder and other members of the Committee, on their moral courage in awarding to the Concord the Greeley prize of one hundred dollars, as the best grape for general cultivation. It makes a good wine, and as a table grape is generally preferred to the Catawba, and sells for more money, all the time. It is easily propagated, not subject to disease, and will endure a greater degree of cold and neglect, and bear more fruit than any other grape known to this Committee.

"We would say to persons wishing to plant a few vines to raise grapes for family use—plant mostly of the Concord." Again: "At Dr. Warner's vineyard, Sept. 20th, the Concord, gathered from the lower wire, six inches to one foot from the ground, weighed 66 degrees. From the second wire, three to four feet from the ground, weighed 76 degrees. From the top wire, five to six feet from the ground, weighed 78 degrees. This result is an instance to the contrary of the old theory that 'the nearer the ground the heavier the must.' On Oct. 15th, the grapes off the same vines, all pressed together, yielded a must averaging 82 degrees. * * * In conclusion, we would advise every one that has a home to plant grapevines. If they have not room for vines, plant a vine, and let that be a Concord. Give it plenty of room and sunshine, and it will bear grapes every year.—GEO. B. WORTEN, CHRISTIAN LAISLEE, WILLIAM BANDER."

Within a day or two after the receipt of this report, there came a communication from Mr. C. J. May, of Warsaw, Hancock Co., Ill., the same place in which the above meeting was held, who speaks of the Concord as follows:

"The Concord has been quite extensively planted. Many persons have planted largely of it, because men in whom they have had confidence recommended it through our agricultural papers, as being a first-class grape for the table, and that in the West it so changed its natural qualities as to make a wine better than Catawba, and that there was a greater demand for it at better prices. Those who have fruited it for the past two years know that it will not make a wine equal to the Catawba; in fact, that it will not make wine at all—that is, wine that will keep even through the first summer, unless extraordinary means are used to prevent its acetous fermentation. Sugar is generally used to bring the must up to 75 or 80, it weighing in its natural state about 60. The Catawba often weighs 85. It is well known that a must weighing only 60 will not make even a passable wine. Had the Concord all the sugar necessary to make a good wine, it would still be worthless because of its intense foxy flavor, which would alone destroy its value for wine. Concord will not make wine. It is an impossibility. As a market grape it has some value—now selling at a fair price in all our city markets, but selling for a comparatively larger price in our Western cities, where such grapes as the Delaware are as yet little known. As soon as the taste of the people has been educated by the use of good grapes, the Concord will find its level, and sell for its true value only. I have planted the Concord quite largely, and have many vines in full bearing. I believed, as others have done, that the Concord would make a passable wine, and planted it for that purpose. I believed it, because men in whom I had confidence—men who were said to have grown it for some years, positively stated that it would make a wine of good quality. But finding that it will not do what has been claimed for it, I think it full time that the truth should be known. It has been put before the people as our best native grape—as a grape possessing qualities that it never had a shadow of claim too. Many will plant it because those qualities have been claimed for it by men who should know its true value, and the result will be that every man who plants Concord vines will, within four years, find he has made a mistake, and will be badly disappointed. Is it not necessary to real success in any and every calling that our aim should be high? If success in the cultivation of the Concord is our highest

aim, shall we reach a shining mark though we are successful?—"It has indeed been a 'noble' grape—royal even to those engaged in the propagation of it, and with every facility for reaping a grand harvest in this way, ought not I also to thrust in my sickle? leaving the truth to come out afterwards."

Such contradictory testimony as this, coming from one and the same locality, is certainly puzzling to one who knows nothing about fruit, and yet wishes to plant vines. The great trouble in the whole matter is, that grape culture is in that tentative state that it requires considerable more knowledge than individuals or even committees are supposed to possess, to say with confidence that any one of our grapes is the best for any State or county. That we have yet the universal grape, no one believes; indeed one of the very committee who decided the Greeley Prize said to us, a few days ago, that he knew of a grape that in five years would quite supersede the Concord; and we know of several grapes that are accumulating strength to enter the contest for eminence. Our opinion with regard to the many varieties now offered is already recorded. We doubt not that the Hartford and Concord will more generally succeed than any others; but they are inferior in quality to Catawba, Iona, and a dozen others we could name.

Remedy for the Canker Worm

The *Phalena vernata* of the naturalists, or Canker Worm of New England, belongs to the order of *Lepidoptera*, and the class of *Geometers*, or earth measurers, so named from their habit of walking by successive spans. The male

Fig. 1.

moth of the canker worm, as described by Harris, (Fig. 1), has very narrow antennae, and almost downy edging on each side, hardly to be seen with the naked eye. The minute feelers do not extend beyond the mouth. The wings are large, very thin and silky; and when the insect is at rest, the fore wings are turned back, entirely cover the hind wings, and overlap on their inner edges. The fore wings are ash colored, with a distinct whitish spot on the front edge near the tip; they are crossed by two jagged whitish bands, along the sides of which there are several blackish dots. The wings expand about one inch and a quarter.

The female moth is wingless, (Fig. 2), and its antennae are short, slender and naked. Its body approaches to an oval form, but tapers, and is turned up behind. It is dark ash colored above, and gray beneath. It is now known, contrary to the former opinion, that these moths come out of the ground in the autumn and during the winter, under favorable circumstances; but the general time is about the middle of March. If the weather continues very soft and mild they may all be expected to come out of the ground in about a week. If there are cold snaps, and long intervals of frozen weather, their rising will be delayed until better weather. A little observation will teach the fruit grower when to expect them, and when to apply his remedies. The sluggish females instinctively seek the nearest tree, and crawl up the trunk to deposit their eggs. They are followed a few days after by the males for the purpose of pairing. Soon after this the females lay their eggs, which are shown in Fig. 3, of the natural size and magnified. These are laid upon the ends

of the branches, close by the buds, for the convenience of feeding the broods when they hatch out. The eggs are set on end, in rows, and form clusters of from sixty to a hundred or more. They are glued to each other, and to the bark, by a grayish varnish, which is water-proof. This being done, the moths soon die.

Fig. 3.

The eggs hatch from the first to the middle of May, or about the time the currant blooms and the apple shows its first leaves. When in sufficient numbers they devour the young leaves as fast as they grow, and by June the whole orchard presents a russet, burnt appearance, as if scorched by fire. They are terribly destructive. The seem to like the apple and elm trees best, but are found upon the cherry, plum, and lindens, and other cultivated trees and shrubs, when their favorite food is wanting. The worms

Fig. 4.

feed for about four weeks, and when full grown measure about one inch in length. (Fig. 4) They are ash colored on the back, and black on the sides, with a yellowish line on the belly, but vary somewhat in shades of coloring, depending perhaps upon the quality of their food. When full grown, they either crawl down the trunk, or descend by a web, and immediately burrow in the soil if they find it soft enough, and turn to chrysalids in their cells. The chrysalis (fig. 5) is of a light brown color, and varies somewhat in size according to the sex, the female being the larger.

Fig. 5.

It will be seen from the character of the insect here described, that the most available method of destroying it must be by attacks upon the wingless mother, as she ascends the trees in spring. Various methods are given to accomplish this, but we like best that presented by Ralph W. Robinson, of Hampton, member of the Connecticut State Board of Agriculture. It involves a good deal of labor, but that is the price of good apples by any or all methods. He who will not take the trouble must go without apples—and ought to. Mr. Robinson says:

"I take a sufficient quantity of common tar, and an equal quantity of urine, (the latter to be increased or diminished, according to circumstances, or the judgment of him who applies it.) Heat it in an iron kettle, and stir it until well mixed. I then, with a brush, or swab, made of old rags for the purpose, apply it around the trunk of the tree, on a space about three inches wide, in the best place I can find between the ground and the limbs. The females stick fast in this tar, and the millers coming to pair with them, stick fast also, where their destruction is sure. The application should be repeated every evening (unless the ground be frozen), until they have done running, which is usually in from one to four weeks.

"Last year the ground did not thaw out until late in March, and kept so until they finished their running, which was five days. The reason of mixing urine with the tar is this: If tar is put on clear, it hardens so rapidly that the grubs crawl over it; whereas if softened with urine, it remains soft for a longer time, and completes the work of destruction more effectually.

"I think also that clear tar is more liable to injure the trees. It is recommended by some to put a strip of cloth about three inches wide around the tree, and put the tar upon that, but mixing it as I do, and then scraping it all clear from the tree as soon as they have done running (which may be done advantageously on a

warm day), I consider there is no danger of injury. I cannot see that *my* trees have been injured, and I have practised it for five years, at the same time keeping the better of the enemy."

A Committee of the Essex (Massachusetts) Agricultural Society recommend printer's ink as a substitute for tar, it being quite as effectual and less expensive. They advise to first surround the tree with tarred paper and smear this with the ink, diluted with oil, thin enough to apply with a brush. They say that it needs renewing less often than tar—only once every two or three weeks. The same Committee also give the sensible advice to cut down all the old and unfruitful apple trees, of which hundreds are found in every community, cumbering the ground, and only serving as nurseries of worms.

All the Year Round.

The statement that a day laborer, in a large city like New York, has a greater variety upon his table, the year round, than many wealthy farmers, may seem strange, but it is nevertheless true. This variety does not consist so much in the meats as in the vegetables. Indeed the one thing that the city dweller misses, when he makes a visit to his country friends, is a variety of vegetables. The city markets and green groceries present a great assortment, and the tables of even those in moderate circumstances generally have some one or more of the products of the market gardens upon them. There is no reason why every one who has sufficient land should not have fresh vegetables all the year round. Aside from the roots that are in the cellar, or left in the ground, there is the cabbage, raw or cooked, as the main reliance for winter. In using the cabbages, save the stumps, to set out as soon as the ground is open, for most excellent greens. This month the Kale or Borecole that has been wintered out, will be an agreeable change from the cabbage. In April, winter spinach will be ready to cut, and the tender shoots of asparagus will give the first real fore-taste of the host of good things that follow soon after. Besides, lettuce, cresses and other salad plants, should grace the breakfast table, for their refreshing look if nothing more. There is "no end" of excellent vegetables to go with the dinner, and where there are plenty it makes little difference whether the meat is fresh or salt. It has been a custom with us to publish, each year, a list of the most desirable vegetables, as well as to make a note of the new ones offered for sale. We find that our different advertisers have given a very full account of the novelties, at least, and in the "Notes for the Month," we indicate reliable and readily obtainable sorts. If the farmer passes by the notes on the "Kitchen Garden," as something beneath his notice, she who provides for the table, and wishes her family to have a variety of healthful food, will read them—and have the vegetables too, or she is not the woman we take her to be. If a hot-bed or cold frame can be managed, all the better; but without these helps to greater earliness, a little forethought and painstaking will give every farmer fresh vegetables "all the year round."

Profits from Small Places.

The raising of early seedlings of culinary plants was referred to last month. Another way in which a small tract of land may be turned to profitable account, is the propagation of small fruits. We may safely say that, in a small way, more profit is to be derived from the growing

of plants than of fruit. Within our knowledge there are several instances of eminent success with these small fruit nurseries of moderate extent. To be successful requires a knowledge of varieties, and the methods of propagation required for each. There is nothing about these that an intelligent man cannot learn; and scarcely one that has not been sufficiently treated of in our own pages. One must not only raise the plants, but let it be known that he has them. Strawberry, blackberry, raspberry, currant and other plants are in demand, are easily raised in a small way, and are profitable. Take the strawberry, for instance; we have not known a season for several years in which there was not a scarcity among the leading varieties. If strawberry plants are grown, we would advise the main planting to be of a few of the leading varieties, and enough of the novelties to get a start and be ready to take advantage of a demand for any of them; yet we would not invest enough in any one of the newer sorts to feel disappointed if the latest novelty proved a failure—as in the majority of instances it will.

There is always a scarcity of currants, of the finer kinds; these are raised readily from cuttings, and grow to good plants in a year. Whatever kind of propagation one engages in, strict integrity is essential to success—the most scrupulous care in procuring genuine stock, with which to make a beginning, and the greatest pains to keep each sort distinct and true to its name. Attention to these things will soon establish a reputation for accuracy, without which no propagator can hope to retain his customers.

A New Apple—Dodge's Crimson.

Pomologists in Ohio, Illinois, and other Western States, find their best apples, or rather their best keepers to be of southern origin, while those known as long keepers at the East, are only autumn sorts with them; hence a great interest attaches to all southern varieties. Mr. J. W. Dodge, well known as an artist before he became a fruit grower, has brought us a collection of fine apples from his fruit farm and nursery at Pomona, Cumberland County, Tennessee, which comprises fine specimens of well known varieties, and others not familiar to eastern fruit growers. In the collection is a seedling raised by Mr. D., which he calls Dodge's Crimson, and as it has not before been published, we give a description and figure of it. Mr. D.'s place is on the table of the Cumberland mountain, and 2,000 feet above the sea level.

The tree is a good grower, with a round or spreading head and slender and tapering limbs which droop, but never break, with the weight of the fruit; bark very dark; it is an annual bearer.

Fruit medium to large, roundish oblong, tapering slightly towards the eye; smooth and even in form; color very dark crimson, sometimes nearly black, and on the tree covered by an abundant bloom; dots minute, few and inconspicuous; basin rather deep, a little irregular; eye very small, closed, segments of calix with tips reflexed; cavity deep, acute, somewhat irregular; stem very stout; core open, not meeting the eye; seeds roundish, light colored; flesh white, juicy, tender, at first a brisk acid; use—cooking, or table, very fine for jelly; season, November to March; a good keeper.

Cedar and Thorn Seeds—Stratification.

There are on file, some dozen or more complaints of want of success with the seeds of Red Cedar, Thorns, Dogwoods, etc., from persons who have sown the seeds and failed to get any plants. The trouble is, that these seeds do not come up until the second year after they are put in the ground, and if they are sown in a bed and left for a year, the weeds take such complete possession that the young trees, if they do start, have but little chance. To avoid this difficulty, the English propagator puts his seeds in "a rot heap" for a year, and the French "stratify" them, both names meaning the same thing. The manner of proceeding depends upon the quantity of seed; if small, a common flower pot, box, or keg is employed, and the seeds

are placed in the receptacle with sand, or sandy earth, in alternate layers. The vessel containing the seeds is buried in a well drained place where the seeds will not be enveloped by standing water, nor dry out during summer. If a large quantity of seeds are to be operated upon, a heap is built up, putting alternate layers of seeds and earth, and making a mound with sloping sides to carry off the water. The seeds are usually ready the second spring after burying, and should be sown as soon as they show signs of germinating. Seeds of trees which form a strong tap-root, even if they are not long in germinating, are best treated by stratifying; such as Walnuts, Chestnuts, Horsechestnuts, and even Peaches. They are kept in

this situation until the radicle pushes, when they are carefully planted, previously pinching off the lower extremity of the young root. This promotes the branching of lateral roots, and avoids the formation of a long tap-root. Trees from seeds treated thus, are much more readily and safely transplanted than those that have not received this early root pruning. Those who buried peach pits last autumn will do well to observe this precaution, when they plant this spring, as they will obtain much better trees.

NEW TREES.—A golden leaved variety of the common European Alder is advertised by the French nurserymen under the name of *Alnus aurea*, as being a permanent variety and very showy shrub.—Also a remarkable Walnut, from the North of China, *Juglans macrophylla*, the leaves of which are said to be three feet long.

Hobbies in Horticulture.

An old friend of ours, whom it is a delight to visit, always has some hobby, which, for the time, he rides bravely. The last time we were at his place, he was riding Chinese Primroses; his new seedlings were just coming into flower, and the pleasure he took in observing the difference in the shades of color, or the promise that some plants gave of being a little more double, or otherwise different from others, was something pleasant to see. In this country we have but little of this devotion to one particular genus or family of plants. Abroad, they have their chrysanthemum, anricula, gooseberry and other shows, and even societies devoted to some special culture. In our desire to do a little of everything, we do but little well, and are disposed to sneer at people who estimate gooseberries by grain weights and count the pips of a flower truss. Yet great perfection comes out of this devotion to a single thing. Years ago, we knew a journeyman shoemaker who carried all the prizes for asters away from under the noses of "gentlemen's gardeners," and, in his own humble way, did as much for the improvement of this flower as Truffaut, or any of the foreign florists. What can be pleasanter, for those who have leisure and taste, to take a plant, or several plants, and see what they are capable of, and by selections and crossings make them do their utmost. We suggest this not only for flowers, but for fruits, as there are many fruits that have not yet been half developed.—Who has crossed a peach? and yet what a chance the Golden Dwarf presents for experiments. Who will give us a raspberry as hardy and prolific as the Philadelphia, and as fine flavored as Brinckle's Orange? Where is the sweet and high flavored strawberry as surely productive as the Wilson? Then, in flowers too, are we to stop with what the Japanese have done with the lilies? Will not some one put odor into our native violets by a lucky hybridizing? There is a whole host of hobbies waiting for some one to mount them. We ask those who are on the look out for every "new importation," and spend their money freely for the results of foreign skill and patience, to try their hand at the home production of "novelties" in fruits and flowers. Let what Snow has done with the Verbena, and other of our florists with the Carnation, encourage the belief that success is not confined to any country.

The Sweet-Scented Shrub, or Carolina Allspice.—(*Calycanthus floridus*.)

For those who prefer fragrance to beauty of flowers there is no common shrub from which more enjoyment may be derived than from the *Calycanthus*. It is not particular as to soil or treatment, remains in flower for several months, and diffuses a strong fruit-like odor that is to most persons very agreeable. It is a shrub that has already become popular, and we notice it now as one of those good old things that every lover of shrubbery should have. It grows from six to nine feet high, and naturally forms a roundish clump. The character of the leaves and flowers are given in the engraving. The flowers are of a brownish purple color, with

but little difference in appearance between the calyx and corolla. The parts of the calyx are united below, and form a kind of cup which encloses the pistils, a fact that gives origin to the botanical name. The bark and leaves have an aromatic odor, which doubtless suggested the name of Carolina Allspice, while the fragrance of the flowers, compared by some to that of strawberries, and by others to that of apples, has given it the name of Sweet-Scented Shrub. The flowers give off their odor more powerfully when crushed or slightly wilted. There are several varieties which are ranked by some botanists as species. *Calycanthus glaucus*, *laevigatus*, *inodorus*, etc., are put down by

THE SWEET-SCENTED SHRUB (*Calycanthus floridus*.)

some as distinct species, and by others as only varieties of *C. floridus*. It is found in most of the Southern States, one variety extending as far north as the mountains of Pennsylvania. *C. occidentalis*, of California, is much larger in all its parts than our Eastern plant, and has brighter colored flowers. This is prized in Europe as an ornamental shrub, but we have not noticed it in cultivation with us. The *Calycanthus* readily multiplies itself by an abundance of suckers, or it may be propagated by layering.

"Getting a Few Turns Ahead."

A man employed in a ship-yard to turn a grindstone was found by the men, when they came to their work, busily engaged in turning the stone. When asked why he was turning when no one was holding, he replied, "I am getting a few turns ahead." The idea was a good one, but not well carried out. Getting "a

few turns ahead" can be done in many operations, and in none more satisfactorily than in the garden. Whoever cleaned up and burned all rubbish last autumn, got "a few turns ahead" of him who has to do it this spring, when all is so soaked that it won't burn. Now, before garden operations, in most places, fairly begin, something can be done to forward plants, and have them ready earlier than they would be in the natural course of things. Those who have hot-beds or cold-frames have already read what we have said last month on page 63. If there is no disposition to try glass, or not the ability to command it, there are the kitchen windows. We last year advised the use of boxes, and can only briefly say now, that they are much better than pots. Get a long box six inches deep; filled with light soil, sow the seeds of early cabbage, tomatoes, etc. Keep it moist and exposed to full light in the kitchen window, where cooking and washing are going on, and the air is always moist, and the young plants will soon be up and need thinning. Thin, and transplant the thinnings to another box like the first. Open the window on mild days, or set the boxes out of doors during the middle of the day, and there will be a lot of hardy plants ready to put out by the time a less wide-awake neighbor is just sowing his seed. On a larger scale, make a bed as soon as the ground thaws, put a frame around it of nine inch boards, and have some shutters made, of boards battened together, to cover it. Open the frame, when the sun is warm, in the morning, and cover it as soon as the heat declines in the afternoon. In a short time the soil will get well warmed, and lettuce, radishes, cabbage, and other things, may be forwarded considerably without glass. Get ahead of your work in every possible way; having tools ready, manure in sufficiency, seeds procured, and wherever forethought will do it, be a "few turns ahead" in the garden.

Earliness in Vegetables.

If we can get a variety of any vegetable a few days or a week earlier than any before known, it is a great gain, especially with the cultivator for market. Much that is said by vendors of seeds, about extreme earliness, that experience fails to sustain. One, this year, advertises a tomato thirty days earlier than any other sort. Now, a tomato a whole month in advance of any we now have, would be, near New York, worth a small fortune, and we doubt not it would be proportionately valuable elsewhere, and few would be willing to part with the seeds of so precious a variety. While we hope that all that is said of this tomato may be true, we would not have any one deterred, by our doubts in this case, from striving for great earliness, or testing this, and all other things claiming to be in advance of ordinary varieties.

Much can be done in most vegetables by selecting, year after year, the earliest for seed. We know of an instance in which this plan of selecting the earliest Sweet Corn for seed, for several years in succession, resulted in establishing a variety of great earliness. If in saving peas for seed we took the very first pods for next year's crop, instead of using them upon the table, we should not be running after "First Crops," "Expresses," and other new sorts of peas—and the same with other vegetables.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Home-Made Household Ornaments.

We present this month some ornaments a little more elaborate than those given in the last number:

Fig. 1, is a rustic flower stand, made to hold two eight-inch pots, with Geraniums, Fuchsias, or any other flowers suitable for the living-room or parlor. The foundation of the stand is a piece of board about 20 inches long, and $\frac{1}{2}$ inch thick. Pine or some soft wood is the best. This is cut out on the front in the shape of a capital B, only the indenture is not quite so deep, and the edge upon which the slats are to be nailed, are left a little flaring, so as to give the required shape to the stand, the top of which should incline outward, about an inch from a perpendicular line. A strip of rattan or willow, three-eighths of an inch diameter, is first nailed with small brads upon the lower edge of the board, against which the slats are to fit. The slats are made of light and dark colored wood, with the bark on, split from sticks 1 to $1\frac{1}{2}$ inches in diameter, and whittled down to a $\frac{1}{4}$ inch in thickness. They are

Fig. 1.—RUSTIC FLOWER STAND.

made a little narrower at the bottom than at the top, to provide for the flare of the stand, and are picketed at the top as shown in the sketch. These slats are fastened to the board at the bottom, with small brads about $\frac{3}{4}$ inch long, and at the top, to a strip of rattan, willow, or any other lithe wood, about half an inch in diameter, whittled flat upon one side, to fit neatly to the slats. The nails or brads at the top should be much smaller than those at the bottom. The bottom of the stand is finished by nailing strips upon it in the same style as those at the side, fitting them neatly to the rattan or willow on the edge. If the slats have not been previously finished, rub slightly with fine sand paper to remove any roughness, but not to disturb the original bark color.

You now want a pot of warm glue, and a good selection of acorns, in the cups and out of them. A row of these should be fastened around the bottom, next to the willow band, taking care to put

Fig. 2.—RUSTIC BASKET.

them so that they will not hit the floor or window ledge, when the stand is in its place. The rosettes at the sides are made of acorns, and the cones of the Black Spruce, and those in front of single acorns, with the scales of the Norway Spruce cone placed around them. The ornaments seen between the rosettes are made of sprigs of the oak, with acorns having cups on them, and small spruce cones at the bottom. In the arrangement of these there is room for the home artist to display his taste. These are fastened on with glue, and after they have dried a few days, the whole should receive a coat of varnish. The inside bottom of the board should have paper pasted upon it, when it is ready for use. This flower stand is open upon one side as shown, and may stand in the window, or upon the mantle piece.

Fig. 2, represents a rustic basket in the same

general style of work, varied by handles and legs. It is about eight inches across the top, and the same in height. The handles, the edging at the bottom, and the band upon the inside, to which the slats are fastened, are made of rattan, but willow will answer. The slats are made of dogwood and hazelnut, about a $\frac{1}{2}$ -inch through, and are fastened with brads or tacks. The legs are about $\frac{3}{4}$ inch in diameter, and raise the basket about an inch from the stand or shelf. It may be a appropriately used to hold a flower pot, a vase with a bouquet, or for the

Fig. 3.—PIN CUSHION.

work-table to hold knitting or sewing when laid aside. All wood that is used for this kind of work should be first thoroughly seasoned. We have several varieties well adapted to this work. The main thing in the selection is to have uniformity of size and a pretty contrast in the color.

Fig. 3 represents a pin-cushion. The foundation is a bit of pine board, cut or turned in a lathe, round, about seven inches in diameter. It is furnished with legs $\frac{1}{2}$ or $\frac{3}{4}$ inch long, and the underside is covered with morocco paper. The pin-cushion on top is any pretty pattern of worsted work, stuffed with wool. The border of rustic work, about $1\frac{1}{2}$ inches wide, is quite elaborate, presenting a dozen varieties or more of acorns, cones, seeds, and berries gathered from the woods. The top and bottom courses are made of the scales of the cone of the Norway Spruce, turned inside out, and fastened to the paste board with thread and needle. There are

three courses at the bottom, and two at the top. The space between is filled in with acorns of several varieties of oak, beech nuts, hard hack seeds, black spruce cones, dried berries, seeds of weeds, and buds of evergreen trees stripped of their foliage. Almost any small shrub or weed, whose seeds hold on in the winter, will furnish appropriate material for this kind of work. They may be fastened on with needle or glue, as can be done to best advantage. When tastefully wrought up, they make beautiful pin-cushions. They not only ornament the toilet table at home, but command a ready sale at fairs, and are a source of profit to the maker.

Leaves from the Diary of a Young Housekeeper.—No. II.

PRIZE ESSAY BY MRS LAURA E. LYMAN, STAMFORD, CT.

Jan. 31.—For a few days past I have been sending broth and other delicacies to a poor family about half a mile down the road; two of whom are sick, a little girl and the father. He was a Union prisoner at Salisbury, N. C., and was released at the close of the war with a shattered constitution and a gloomy future.

There are three or four girls in the family, one about twelve years of age, and Edward has been talking about the propriety of our taking her when the father dies, as, poor man, he must before many days. Edward says that next summer, when he has a number of farm laborers, I shall need some help, and it will be a great advantage to the girl if she can be taken into a good family, where she can learn the best ways of doing work, and so become useful to me as long as she stays, and able to command good wages in service.

I should prefer to take a girl who has a more thrifty and energetic mother than she seems to have; for the family belongs in that great class of the shiftless and the improvident, who always were poor and always will be. But I really feel, that all who can give such children a lift ought to do so, and perhaps I may put this girl in the way of be-

coming an excellent housekeeper, and eventually the mistress of a home of her own.

Feb. 25.—The poor soldier died. Edward and I went to the funeral, and it made my heart ache to see those five little ill-clad orphans shivering on the heap of frozen dirt at their father's grave, their feet only half protected from the snows of mid-winter, and their future apparently as dark as the lowering skies above them.

The next day we went down in a sleigh, and got Sue with her little bundle of clothes, tied up in an old handkerchief. She has been here ten days, and I've been thinking a good deal as to how, both for her own sake as well as for mine, I can make the most of her. She is cheerful and always willing, but has no ideas of thrift, economy, or neatness. To teach her these, and, at the same time, divert her mind from her grief and loneliness, I have devoted a good deal of time to her. I find I must not expect very much, and must have great patience with her dull preception, and her weak memory.

On one point I have been very successful, and this gives me encouragement that the same system in other departments will be equally effective.

She seemed to have no idea as to how a table should be set. So, to assist her conception, I wrote out in a very clear hand the following list, and pasted it on the inside of the closet door: "Tablecloth, napkins, mats, plates, knives, forks, spoons, glasses, cups, saucers, sugar and milk, butter, salt, the castor, bread, water, the dishes from the stove, chairs." Just under this paper I drew a little outline picture of the table, with all the dishes on it in their proper places. The effect was magical. She now looks upon table setting as pastime, and does it as well as I could if I were expecting Miss Leslie herself to dine with us.

Raised as she has been, in an atmosphere of improvidence, it is not strange that I could not get her to remember to put on her dishwater at the right time. But she looked so mortified at being constantly reminded of it, that I changed my tactics, and told her she should have a penny every time she remembered it, and forfeit one every time she forgot. For two days now there has been plenty of hot dishwater at the right time, at an expense of three cents a day, but the value of that habit alone, when once fixed, cannot be estimated. It has always been a topic of conversation, and a ground of complaint with my housekeeping acquaintances who employ help, that they have to work almost as hard to get the servant to do the work well, as if they did it all themselves, besides the greater waste and trial of patience. But I think if servants were kindly and fully instructed in what is expected of them, they would certainly try to please. My success with Sue about the table makes me believe that similar painstaking will make her equally reliable and thorough in all kinds of work. So I am writing out a catechism in questions and answers, explaining exactly how and when everything she has to do must be done; how, for instance, she can wash her dishes in the quickest and best way; what she must do first, and what next when she gets up in the morning. This catechism she recites to me every night after tea, and I have promised her that as she learns what I have written, and carries it out, I will instruct her as thoroughly in washing, ironing, and bread-making.

March 3rd.—Yesterday we returned from a visit to our relatives, which was very pleasant. We went to Edward's home first, where we stayed a week, and then to mine, where we spent another week.

Edward had prepared me somewhat to find things a little different from what they are in my home, but the contrast was far greater than I imagined. There never was a more amiable woman than his mother, and few men are so thoroughly sensible as his father. But how such an order-loving, systematic man as my husband, ever grew up in such a family, is past my power of conjecture. While he was talking, one of the girls came up to tell us breakfast was just ready, and we went down. A savory meal was smoking on the table, and the fragrant coffee most gratefully greeted our olfactories, as we entered the dining room. Whatever defects my new mother possesses, she is an excellent cook,

perfectly at home in the culinary department. There is no lack in the store-room, for Edward's father is well off, and provides his family with all they need. We sat down, and one after another the family gathered round the table. Jane was still in bed, and Julia was not quite ready. The boys were busy about something, and we were nearly half done eating before the entire family assembled at the table. It seemed so strange to me, for my father would never ask the blessing until every child was in his place, and we were as obedient to the ring of the breakfast bell as it was possible to be. But here, every one came when ready, and all left when they had finished, as though they were at a hotel. Jane made her appearance after we were quite through, her hair in curl papers, and with a soiled morning dress carelessly wrapped around her. She said she had laid awake reading Victor Hugo's "Toilers of the Sea," until a late hour, and didn't feel like getting up early. At last everybody was done eating, and I helped clear away, expecting that the table would at once be put in its place, and the dishes washed up and put away. Edward went out with his father to look about the place, and the boys were busy with their sleds and skates. Edward's mother was taking care of the milk, which had set through breakfast unstrained, while Julia devoted herself to her canary bird, and Jane dreamily addressed herself to the task of washing the dishes, talking all the time about the novel she had read the night before. It was ten o'clock before every thing was put away, and then it was most time to begin to get dinner.

It was very different at my home; we were all made to get up early, and while mother moved about the house, putting everything in order, and superintending the several domestic departments, one of us girls got the breakfast, another took care of the milk, and the other trimmed the lamps and helped generally. The boys brought in wood and did the various chores that boys usually do. We all sat down to table together, and after breakfast and prayers were over, one of us girls cleared away the breakfast dishes, another swept the floor, or made the necessary preparations for dinner, and thus by a division of labor, our work was all done up by nine o'clock, floors swept, beds made, and everything in order. Mother had us take turns in the different departments. I had entire charge of the table one week, while Emeline attended to the chamber-work and sweeping, and Jennette was responsible for the work not included in these divisions. Thus, by a system of rotation in office, we all became familiar with the entire household routine, while Mother directed and supervised all.

March 10th.—I was not half done writing in my Diary, when Edward came in with bad news, and a funny time we have had! The old mother pig suddenly died, leaving ten poor little orphan babies only three days old. "What shall be done with them?" we both exclaimed. My sister Jennette, who came home with me to stay a month or two, and who is extremely fond of animals, suggested that we bring them into the house and raise them by hand. So we took the two bushel basket, filled it half full of soft oat straw, and the bereaved family was established in a warm corner back of the kitchen stove. I scalded a quart of new milk, added a little water, as I had seen mother do for human babies, and Jennette and I spread large aprons in our laps, and began to feed them. We had to open their little mouths with our fingers and pour the milk down their musical throats. Such a squealing as they made! but they relished the sweetened lacteal very much. In two hours, we repeated the operation, passing them all back into basket No. 1. At night we took turns in feeding them every two hours. They soon learned to squeal the moment they heard the rattling of the spoon, but by feeding them the last thing at night, and the first thing in the morning, we secured good rest last night, and they are growing so fast!

I meant to have written more about my visit, but the advent of the ten baby pigs so unexpectedly into my kitchen, quite banished all thoughts of writing from my head. And I have been occupied with Jennette, and in teaching Sue, and in making

and receiving visits.—Who should come to see me the other day, but Bettie Hannum! She was married the week after I was, and went right to house-keeping. Such doleful accounts as she gave of her experience in cooking! She used to say, she thought my mother was very hard on her girls to make them do so much housework, that it would be time enough to learn how when she had a house to keep, and her mother wanted her to enjoy herself while she was free from domestic care. She sees her mother's mistake now.

Leaves from My Journal.

PRIZE ESSAY BY MRS. B. McLELLAN, OF OHIO.

I have been making a "shoe bag" for Lizzie to-day. I made a small one, too, for Hannah's room, though I don't know as she will take the trouble to use it. As it is quite fanciful, she will like it for an ornament at any rate. Lizzie's is of green delaine, bound with crimson braid, and lined with cambric of the same color. It is really pretty. A good size is three quarters of a yard in length, and half a yard in width. This gives room for three tiers of bags, with three in a row. The lower ones are the deepest; and the upper, being the smallest, furnish a nice place for the shoes of the little ones, or for stockings as well. One of the lower corner bags is just the place for "father's" slippers. The bag should be tacked upon the inside of the closet door of the bed-room.—A "string bag" is most convenient in the pantry; made of calico, a quarter of a yard square, and hung by a stout cord to its own nail. Let every string around store bundles and every thing else find place in it. Though within reach of "Charlie," who has such unheard of uses for strings, it will always be running overfull. Another useful bag about house, is one for patches and pieces of all sorts. This should be large and square, so that, upon drawing it wide open, the whole contents can be seen, without being at the trouble to empty it. The old-fashioned "rag bag," though not ornamental, must have some good corner for safe keeping. Not a shred should be carelessly thrown away. Its contents will keep the tin mended, and now and then furnish a bright addition in that line, which the careful housekeeper, with a self-satisfied shrug, will pronounce "clear gain."

I called to-day upon two of my friends, and have been thinking so much about them, I must tell my Journal some of my thoughts to night. They are both considered very superior housekeepers, but view life and its duties from quite opposite standpoints. Mrs. W. is an inveterate scrubber. Her house, from attic to cellar, and everything in it, is just as clean as soap and sand, and hard rubbing can make it. She has a large family, and usually does the work herself, for she can not find help neat enough to suit her. Of course she has no time for any thing else. She is jaded and worn, and so annoyed by dirt, that I fear her children do not find home either bright or happy. She seldom goes out, but she mourns that her *cares* allow her no time for enjoyment.

The home of Mrs. Y. is equally neat, but much more inviting. She is often called overnice. Perhaps she is. But she says she has found that keeping every thing in order, and doing every thing at the right time, *saves* work and time too, and she does it for that. At any rate, she has time for many a work of love. She visits the poor and the sick, with hands and heart full, for their relief and comfort. She is kind and polite to all, intelligent and beloved. If a choice bouquet is wanted, or a delicate cake, a garden herb, or the very best recipe for any thing in the housekeeping line, it is well understood that Mrs. Y. is the one to supply it. "Her children rise up and call her blessed, her husband also, and he praiseth her." Her home is relieved from the stiffness and exactness of too scrupulous order, by the atmosphere of love, with which it seems ever surrounded.

March.—One of my neighbors told me to-day, that her Pickled Peppers were covered with a white seum. She had scalded the vinegar, and then put on new, but all to no purpose. She had come to

the conclusion that the vinegar was poor. That may be the trouble, as Peppers keep better than other pickles. But for the past two years I have put horseradish root among mine for this very purpose, and it has been "just the thing." It adds a fine element to their flavor, and has wholly prevented the white seum. Tomatoes are favorite pickles with us. I choose those of small size, slice them and scald a few minutes in strong salt water. After draining, I pack them in a jar, sprinkling among them cloves, cinnamon, peppers, and horseradish. The vinegar should be scalded, and poured over them hot. They keep well until they are eaten up! When blustering March comes round, pickles find a good market. I don't know why it is, but the appetite becomes dainty, and craves something sour and stimulating. Now is the time for the housekeeper to bring out from her hoarded treasures the *canned red cherries*. How splendid their color! How delicious and acceptable their flavor! Mr. Frisby declares, again and again, that they "go to the very spot." However, they must not be dealt out too generously. Currants, blackberries, and jellies, give a good variety. Apples, too, must be freely used, for they will soon become insipid, and there is scarcely an end to the different modes in which they may be prepared for the table. Cut into halves, removing the cores and skins, and filling the space with a little butter and sugar, and baking in a pan, in which has been poured a little water, they make an excellent dessert to be eaten with cream and sugar, or served as sauce for the tea-table. "Yankee Pie" is another favorite dish. Slice apples into a quart basin, or pudding dish, which has been well buttered. Add a little water, and cover with crust about half an inch thick, made up as for soda-biscuit. It requires about three-quarters of an hour to bake. Place the plate to receive it upside down upon its top, and reverse the whole. The apples, white and soft, will thus be upon the crust, and may have a dressing of butter, sugar, and nutmeg. But the crowning dish of all is fresh apple-pie. (That is, provided I make it myself!) *Too much* apple is usually put in a pie. Let the plate be only even full, but of a quality that is tender, tart, and juicy. Add sugar, butter, salt and a little nutmeg. This last gives a lemon flavor if used in small quantity.

Mr. G. took dinner with us to-day. He came round to his favorite topic—comparing the women of the present generation with our wonderful grandmothers and great-grandmothers of the olden time. He enjoys it so well, and is so perfectly set in his opinion, that I don't take the trouble to have any argument with him. One fact, however, is noticeable. He never alludes to the sturdy old *grandfathers*, who were a match for their wives any time. Who ever heard of them with false shirt bosoms and wristbands, with paper collars, and all manner of fancy neckties, with kid gloves, or stove-pipe hats, or cloth boots, or bosom pins, even if they were miniature *links*, or *rule* and *compass* set in gold! Were they found at the Theatre, or Opera, or even at the counting-room, until the small hours of the night! By nine o'clock they and their families were in bed, and long before the morning light crimsoned the east, they were up and at work, milking the cows, and feeding the cattle. How, in the dead of winter, with good homespun suit, and cowhide boots, and mittens that "mother" had knit, they were off with an ox-team to the woods, cutting and drawing, with never flinching patience, the year's supply of firewood. How heartily they breakfasted, and dined, and supped upon "*potluck*," with a good mug of cider for a condiment. Who ever heard then of bronchitis, or dyspepsia, or a voyage to Europe, or dumb-bells, or fishing-snacks, for health? I do hope Mrs. G. doesn't try very hard to be like our grandmothers, for I am sure her husband don't remind me in the least of the grandfather's of yore.

A blessed old man of eighty-three was mine, when he went to rest. A fresh, rosy face, and a heart full of love, had he. His teeth were as sound as a nut, but his head was bald. He wore a wig of young brown hair. Ah, me! human nature was the same then as now, after all!

BOYS & GIRLS' COLUMNS.

Learn to Use What You Know.

George Barnard's father brought home from the war an empty bomb-shell as a relic from the battle-field. George was a bright boy, though a small one, and was much interested in his father's story about the shell; but he wanted to make the relic useful. He therefore filled it with various seeds, pouring them in carefully through the fuse-hole, and buried it in his garden, with the top out of ground. One morning his father discovered the buried shell. "Why, George, what's this? Are you expecting a crop of bomb-shells by and by?" he asked. "Oh, no, father; it's full of seeds. I thought they would do well in such a nice, warm place; but they don't start yet." "Nor will they, my boy, if you live to be a hundred years old. The seeds need to be dropped in the ground, Georgie, where they can have room and nourishment, and a chance to put out roots below and sprouts above." George took up the shell and "unloaded" it. That evening Mr. Barnard told his older children of George's operations. "It makes me think," said he, "of a learned man who can't use his learning for himself, nor give any body else the benefit of it,—one whose head is stuffed as full of book-knowledge, or ideas, as that shell was of seeds—good enough in themselves, but not one of which can get fairly out. Now, I want you all to be intelligent boys and girls; but I want you, when you learn a good thing, to think *how to use it*, so as to make it of service to yourselves and others. You have, perhaps, learned some things to-day, which may be made valuable if you try to think *how* they may be made so. I have heard wise men say that they had known persons, with comparatively little knowledge, to make themselves of far more value to the community, from understanding how to use what they had learned, than others whose heads were full. The knowledge of these last was like gold in a mountain—precious if it could be got out, but useless while it lay buried."

UNCLE PAUL.

Curious Geographical Problem.

In the December *Agriculturist* (page 41), the following problem appeared: "Suppose a person to start from New York on Monday noon, and travel westward at the same rate the earth revolves eastward, thus passing around the globe in 24 hours. It would, of course, be noon the whole length of his journey. At what point in his journey would he find the inhabitants calling it *Tuesday* noon, supposing the whole of his route to be inhabited?" A discussion of this problem was intended for the Feb. number, but was crowded out by other matter. The following communication from Mr. J. D. Pulsifer, Auburn, Me., treats the matter so clearly that it is presented, instead of the comments of the editor:

"Your problem (No. 242) is a very interesting one, but does not admit of a *certain* solution. The traveler will pass over two continents and two oceans. On the Western Continent it will be Monday noon; on the Eastern Continent it will be Tuesday noon; on the Atlantic Ocean, it will be Tuesday noon.

On the Pacific Ocean, at a point somewhere, the change is instantaneous from Monday to Tuesday. Where that point is, has not, to my knowledge, ever been settled.

The reason why the change does not occur on the Atlantic Ocean is owing to the fact that America was discovered by crossing that ocean. If the discovery had been made by sailing from Asia eastward to California, custom would have thrown the change of day on to the Atlantic Ocean. In making a complete circle the day must be changed. Where it is changed is immaterial and conventional. We may, if we please, fix upon the central line of the Mississippi River; all east of that line in the problem supposed, shall be Monday, all west Tuesday; but that is not the line fixed upon. The Pacific Ocean—a very wide line—is the one fixed upon. This is, however, contrary to the definition of a line, length without breadth. When sufficient authority shall have fixed upon some line of longi-

tude in the Pacific where the change occurs, your problem will admit of a more exact solution." Several others have written upon the subject, some of them quite understandingly, especially one who signs himself "Rusticus;" his views are substantially the same as those given above. A large number laughed (on paper) at the problem, and answered "why at New York of course!" If that were true, then it would be Tuesday noon at New York, and Monday noon at Boston, and all places east of this city.

A Borer Under Water.

Many of our young readers may have seen the work of the *borer*, or worm which bites its way into trees, a nibble at a time, leaving sawdust behind it. These insects are very destructive to apple and peach orchards; pine and other trees also suffer from their attacks. With sharp eyes you may find them, perhaps, at work in your neighborhood. A similar class of creatures live in the waters of the ocean. The *teredo* or ship borer, is a small shell-fish, that has the best kind of an apparatus for boring wood, which it uses very effectually. A ship's bottom, unprotected by metal, would soon be pierced by millions of holes made by these minute workers. They attack piles driven to form wharves, etc., and in a few weeks a stont stick of timber may be dangerously weakened. In February, 1861, a great inundation occurred in Holland, caused by the breaking of the embankments which prevented the overflow of the sea; villages were destroyed, many lives were lost, and nearly 40,000 acres of land were flooded. It is believed by good authorities that the piles which gave strength to the embankment had been so weakened by the *teredo* as to give way under the great pressure of a high tide. Where it is needed, protection is given against these borers by sheathing the wood with metal, or *kyanizing* it—that is, filling the pores of the wood with some substance poisonous to the *teredo*. It is stated by a gentleman, in the "Adelphi Academy Record," that "previous to some thirty years since, the augers in general use for boring the holes to receive the fastenings of vessels were so made that, in using, it was necessary to frequently draw them out to remove the borings, and this made nearly one-third of the work. About that time a distinguished Naval Officer invented the auger now in general use, which continuously delivers the borings from the orifice. Upon examination of the boring apparatus of the *teredo*, this gentleman was surprised to find it similarly constructed! One more interesting fact concerning the *teredo*, and we leave it. The creature not only works through the hardest wood, but lines the little tube it leaves with a beautiful casing of fretted shell work, extending to the length of one to two feet.

Don't be a Coward.

This picture history of Timid Timothy, is for the amusement of those boys and girls who are afraid "something will catch them" in the dark, or when left alone. You can see how he was frightened at a mouse, his shadow, etc. The story says he grew more and more like a hare, a most timid creature, until, finally, no one could see any difference between him and that animal, and

away he ran into the woods. We don't say the story is true, but if you will carefully observe men, you will be surprised to see how much they grow to look like the animals which they resemble in habits and character.

New Puzzles to be Answered.

No. 253. Illustrated Rebus.—A beautiful song.

No. 254. Illustrated Rebus.—For the young to remember No. 253. Word Square.—The proper definitions of the following words, viz.: *Apology, Jump, Rest, Monkeys*, written one under the other will form a word square—that is, the words will be the same whether read across or downward. Find these definitions and form the square.

No. 255. Illustrated Rebus.—A true proposition.

No. 257. Anagrams.—Make single words from each of the following: 1, Fat reward; 2, One drum; 3, Red paper; 4, Sophy, I cry; 5, Set on a dish.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the February number, page 67; No. 251. Illustrated Rebus.—

A little darkey (*dark e*) in bed, with nothing over it

.....No. 252. Illustrated Rebus.—A straight furrow, and a well made fence are sure (*rr's ever*) signs of an excellent farmer.

The following have sent in correct answers to puzzles, etc., in previous numbers, up to Feb. 1st, at which time this part of the paper is finished: L. W. Gates, Ada Stanton, Mary A. Rhodes, Alfred Hawksworth, Mary and Lizzie Brumbaugh, Thos. R. Gurnee, Jos. Ball, W. S. Flinn, Isaac A. Chapman, Sarah B. Veatch, W. B. Drew, James Hoffman, J. B. Daniels, C. D. Bishop, F. Schnebley, T. S. Cadwallader, E. G. S., John Wertz, Frank Painter, Theodore W. Bellis, Leonora Barron, Renben Pickett, Mrs. H. A. Rhodehamel, Sylvania Sherman, Isaac T. McLain, Mrs. Ruth A. Clute,

John B. Demster, Abraham J. Greiner, B. F. Albaugh, Hannah Fawcett, Annie McGrew, William Foulk, Charles W. Stewart, Ella C. McWilliams, Jonathan Smith, Wilson Everly, Thomas Bellsmith, George D. Watson, F. Brush.

WHEELER & WILSON ROTARY HOOK

SEWING MACHINES. 625 BROADWAY.

"WOMAN'S GREATEST BOON.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a Sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six year's service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family." *American Agriculturist*, Jan. 1863.

37 PARK ROW, New York.

Illustrated Priced Catalogue sent Free.

B. T. BABBITT'S SOAP AND SALERATUS FACTORY.

We had an opportunity lately of passing through this great establishment, which is one of the largest in the country, embracing Nos. 61, 63, 65, 67, 69, 71, 73 and 74 Washington-st. The space occupied by it seems incredible. Nine buildings of four or five stories, with a depth of from 60 to 100 feet each, and most extensive steam power are embraced. Mr. Babbitt laid the ground work of this immense business some twenty years ago, making a very humble start in a single store. With untiring effort, enterprise, and personal supervision, in twenty-three years he has become one of the millionaires of New York. He is still an active and hard working man. The manufacture of soap—an article so necessary—is always profitable. Soaps of all kinds find a ready market everywhere, and though millions of pounds are poured out of the immense boilers daily, it is soon consumed. This mammoth house gives constant employment to over 200 persons, and huge engines with thousands of pounds of steam keep its machinery in motion. Steam is conducted through the entire block by pipes, some of which cross the street and supply power to two buildings on the opposite side. A boiler which is said to be the largest in the world, and which rises from the ground floor to the fifth story of one of the buildings, it is said will make at one time nearly 200 tons of the best soap, which at the present prices would bring \$52,000. Here is soap for the million in one turn of this monster pot. The grease, etc., is melted by the agency of pipes filled with steam, which run throughout the base and sides of the boiler.

Mr. Babbitt is an extensive manufacturer of saleratus, of which from fifteen to eighteen tons are turned out daily. In addition to this, another article universally used—the STAE YEAST POWDER—is said to possess superior qualities, adding twenty pounds and more to a barrel of flour when made into bread. Mr. Babbitt believes that bread made with this Yeast Powder will prevent indigestion and dyspepsia.

We are pleased to see that his custom is wide-spread in all parts of this country, and we are informed that he has upward of 10,000 regular customers in the United States and foreign countries, which we do not doubt, seeing the number of wagons, drays and carts, continually loading and unloading, and the immense piles of boxes, both inside and outside of the buildings, labeled Soap, Saleratus, Yeast Powder, Sal Soda, Soap Powder, Super Carbonate of Soda, and Concentrated Potash, all of which articles are manufactured by him. With a man of his energy and enterprising spirit, there is no such word as "fail."—*De Bow's Review*.

MARK YOUR CLOTHING!

Clark's Patent Indelible Pencil.

"The Indelible Pencil for marking clothing is much more convenient than ink, and equally good as to permanence—we judge after several month's trial."—*Am. Agriculturist*. "The Indelible Pencil is invaluable for marking linen."—*Chicago Tribune*.

"Remarkable for the ease and neatness with which it can be used."—*Detroit Tribune*.

Manufactured and Sold at Wholesale by THE INDELIBLE PENCIL CO., Northampton, Mass. Prices—50 cents single, \$3 per dozen. Sent post-paid on receipt of price.

A liberal discount made to dealers.

EVERY PENNANT WARRANTED. AGENTS WANTED. See Advertisement "ALL NURSERIES IN ONE," on page 112. Observe the low Prices.

THE GREAT COMMERCIAL ENTERPRISES OF NEW YORK.

During the past ten years the moneyed men of this metropolis have projected many gigantic enterprises, designed to keep pace with the growing wants and tastes of the rapidly advancing civilization of this city and country. Many of these enterprises have rewarded the projectors with liberal returns for their investments—others have been but partially completed—while others, from lack of skill and judgment, were necessarily abandoned either before or after completion. Among all these enterprises there is none more worthy of notice and commendation, and none that has met with better success than that of THE GREAT AMERICAN TEA COMPANY. The founders of the Company believed that the consumers of tea and coffee were paying too many and too large profits on these articles. They projected the enterprise for the purpose of affording the consumers an opportunity of obtaining these necessities at the very lowest prices. They believed that an immense trade could be built up by the ONE PRICE system, and SMALL PROFITS. They based their rate of profit upon a sale of at least one thousand chests per week. The sales at the present time are about double that amount, and increasing daily, which proves unmistakably that the public approve their efforts. This Company do not rest content with their success, but continually strive to improve their facilities for supplying their trade.

This Company have now the most complete, best arranged, and most attractive warehouses in this city or in the world. They are located with especial reference to convening the inhabitants of the metropolis and neighboring cities. Their stores have been fitted up with the latest improvements, and with original designs of prismatic and crystal lights and reflectors, which display with grand effect the superb original oil paintings of Chinese notables, &c., and give brilliancy to the elaborate and unique scenery that decorates the walls.

Among other improvements, we have added to our establishments steam and caloric engines, cylinders, &c., for roasting and grinding our coffee; four printing presses for the purpose of printing our tea and coffee bags, circulars, &c.

Persons have traveled hundreds of miles, in some instances, to examine the establishments of this Company, and have expressed themselves not only highly pleased and delighted, but considered that they were amply repaid for their time and expense, by what they saw and learned, by a visit to the store at Nos. 31 and 33 Vesey Street alone, without even visiting any of the other splendid establishments of the Company.

Whenever heads or members of clubs come to the city, we shall be happy to have them call upon us and make themselves known.

NOTICES OF THE PRESS.

From the New York Tribune.

A SUCCESSFUL ENTERPRISE.—THE GREAT AMERICAN TEA COMPANY commenced business in 1860 in this city. They now occupy six large stores and employ about 250 persons, their sales of Tea and Coffee amounting to \$90,000 per week. Their success shows what ability and enterprise will accomplish. It is simple enough. Their sales being large, they are of course in a position to sell their goods for a smaller profit on each pound. In their advertisements in the *Tribune*, from time to time, they fully explain their system of doing business, and from the many letters received from all parts of the country, we judge that their customers are well satisfied.

From the Christian Advocate and Journal, N. Y.

* * * * Last of all, be sure not to go home from your holiday foragings without calling at the store of The Great American Tea Company, 31 and 33 Vesey Street, corner of Church, and lay in a supply of their choice goods, paying for them not the most extravagant prices.

From the Christian Intelligencer, N. Y.

THE GREAT AMERICAN TEA COMPANY.—Patrons of this company express much satisfaction with the qualities of the teas which they obtain and with the prices at which they are enabled to effect their purchases. The business of the company is conducted on a plan so accurate and comprehensive, that people living at remote distances from this city can give their orders, and have them filled according to advertised terms.

From the N. Y. Day Book.

THE GREAT AMERICAN TEA COMPANY.—Our readers will see in our advertising columns a novel suggestion in relation to getting Tea at cheap rates. The Great American Tea Company offers great inducements to purchasers, and we know the articles it sells are of superior quality.

From the Evangelist, N. Y. City.

TEAS.—The attention of persons who purpose attending the May Anniversaries is directed to the advertisement of THE GREAT AMERICAN TEA CO., Nos. 31 and 33 Vesey Street. It will be seen that this Company have made arrangements to supply families with the choicest new crop of Black, Green and Japan Teas at the wholesale prices. The Company guarantee all the goods they sell to give entire satisfaction. Those who wish to economize are requested to read the advertisement of the Company in another column of this paper.

From the American Agriculturist.

THE GREAT AMERICAN TEA CO.—To Quertes.—Before admitting the advertisement, we learned that a large number

of our clerks and others had for several months been buying their tea and coffee from this company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisements for many months, and received no complaints, we conclude "there is no bumbag about the establishment."

From the Brooklyn (E. D.) Daily Times.

THE GREAT AMERICAN TEA CO.'S STORE.—The Great American Tea Company opened their new and magnificent store on Saturday night, at 133 Grand street. The store was literally run down with customers and thronged until the hour of closing. We regard the opening of this new establishment in our midst as a public benefit. The company has such a thorough organization, possesses such unrivalled facilities for purchasing cheaply, and deals in such enormous quantities of tea and coffee, that they can well afford to undersell any other dealers in the country, and yet make a good profit. Precisely the same tea that is sold elsewhere for \$1.50 can be had of them for \$1.00, and good judges pronounce it even superior. We suppose that hereafter the "Great American Tea Company" will monopolize the business in this place, as the other dealers appear to be too antiquated and old-fogyish even to make their places of business known to the public. The company, on the other hand, knowing that they can sell a better article a third or a half cheaper than anybody else, are bound to spread the information abroad, and the tremendous business which is done at their New York warehouses, at their Western District branch, and now at their Eastern District establishment, shows what enterprise will effect.

COMPLIMENTARY LETTERS FROM CLUBS.

Xenia, Dallas Co., Iowa, Nov. 8, 1866.

Great American Tea Company:

Sirs: The order that I sent to your house the fore part of the summer gave universal satisfaction, and all of the Club have been trying for some time to get me to make up another. The complimentary package which I received was the best tea I have drank in Iowa. Please fill the following order, and express to me at Boonsborough, Iowa.

ZERAH E. COTTRELL.

Franconia, N. H., Nov. 10, 1866.

The Great America Tea Company:

Gentlemen: My last order for tea of 50 pounds came to hand in due time all right, and has given entire satisfaction, and, if you continue to send us as good tea as you have sent, you are sure of a permanent trade in this place. The Imperial was the best of anything we have had in this place. Several of the club have told me it was better than the tea they had paid \$2 a pound for. I send you another order for \$68.65. Please forward as before by express to Franconia, N. H., Grafton County. I thank you for the complimentary package. Address

PRIEST YOUNG, Franconia, N. H.

Elk Horn, Wis., Nov. 10, 1866.

Great American Tea Company:

My order for tea was filled and the tea arrived safely, promptly—good weight and good quality. We are all well satisfied, and others wish they had joined us. I shall doubtless send another order before long, for we have paid large profits to small traders about long enough.

Respectfully yours, &c., O. HANDED.

Fairmount, Illinois, Nov. 12, 1866.

Great American Tea Company:

Gentlemen: Your Advocate fell into my hands yesterday morning, and I at once opened a club in my shop, and hasten to send it now, as it has reached the required size (\$30), and it will take faster and easier after we receive the first bill. I have cut out and posted up in my shop the price list, and some other items, and shall keep a club open perpetually. My shop is in a public place and adjacent to the depot, and I can, ere long, buy of you about all the tea that is used in this town and vicinity. I shall aim to keep some tea on hand to supply such persons as cannot wait for return bill, and also that I may keep the club open longer and thereby increase the size of the bill. I would say that we are all heartily glad that your enterprise is an actual success.

Yours truly, H. M. ROBINSON.

Waterbury, Nov. 13, 1866.

The Great American Tea Company:

Gentlemen: My order of last month of \$140.90 came in good order, and, as usual, gave satisfaction. Inclosed I send you an order not quite as large, but pretty good for one shop. The Merchants growl a good deal, but as long as we can get such tea of you as we have had you will get our money. Accept my thanks for the complimentary package. Please send as before by express, C. O. D. and oblige

Yours, THEODORE ROLLINS,

New London, Nov. 15, 1866.

Great American Tea Company:

Sirs: I herewith send you another club. We are well snited with that which we received before, and much obliged for the complimentary package. We find that it is 50 per cent. cheaper than we can get it here, and at least 50 per cent. better. Please send me two or three blanks for clubs and circulars to go with them, as I know of some in adjoining towns who would like to get up clubs.

Yours truly, L. M. DAY.

Ohio and Mississippi Railroad Line,
Aurora Station, Nov. 10, 1866.

Great American Tea Company:

Gents: Here is your sixth club from these "digglus," making an aggregate amount of nearly \$760. Some of the

country storekeepers here say that your tea is of no account, but the people who use it think otherwise, as is demonstrated by the increasing demand for it. We send inclosed an order for \$191.65, and next month we expect to beat that.

Yours, &c., E. K. LONG.

Lowell, Nov. 20, 1866.

Great American Tea Company:

Gents: I herewith send second order of Merrimac Club for tea and coffee. In regard to first order, would say your promptness in answering it and quality of goods sent gave entire satisfaction, as you will see by an increase of \$24 in this order, C. O. D.

Respectfully yours, D. GORDON,
159 Colburn Street, Lowell, Mass.

Great American Tea Company,

31 and 33 Vesey Street, New York.

November 23, 1866.

To The Great American Tea Co.:

The tea I received gives good satisfaction. My thanks to you for the complimentary package sent me.

Yours respectfully, EDMOND ESTEY.

St. Peter, Minn., Nov. 26, 1866.

Great American Tea Company:

It has been one month since I commenced getting up a club for tea, and this is my third order, and amounts to nearly \$200. All are well satisfied, and say that the tea is as good as we get here at \$2.50. I will send your circulars to all the different towns in my reach, and try and get the whole trade turned in the tea line so that the consumers can save these great profits. Yours truly,

W. O. POWELL.

Fountain Green, Ill., Nov. 28, 1866.

Great American Tea Company,

31 and 33 Vesey Street, New York:

Gentlemen: The tea you sent me the middle of this month was received in good order and gave general satisfaction. The present order is mostly for other parties who are not yet satisfied that it is possible for tea of a good quality to be furnished at your figures after paying former prices. I am sure, however, that a few experiments, resulting as favorably as my first, will give people confidence and insure you a liberal patronage from this locality. Wishing you success, I am, gentlemen

Your most ob't servant, J. M. FOY.

EVIDENCE AFTER A YEAR'S TRIAL.

Treasury Department,

Fourth Auditor's Office, Dec. 1, 1866.

Great America Tea Co., Nos. 31 & 33 Vesey st., N. Y.

Inclosed herewith I send you our regular list for December. It is now twelve months since we began the use of your Teas and Coffees, and I am pleased in being able to say that the satisfaction derived from the use of said articles by the members of this Club, instead of being confined to individual instances, is universal, and I think I may safely say without exception. Thanking you for the many favors received at your hands, I am, sirs, very respectfully, your obedient servant,

L. CASS CARPENTER.

Barnardstown, Franklin Co., Mass., Dec. 3, 1866.

To the Great American Tea Company,

31 and 33 Vesey Street, New York:

Gentlemen: The tea that I ordered from you gives general satisfaction, and I this day mail you another club order, No. 3, for tea and coffee, amounting to \$39.10, which you will please fill and send to my address, by express. Please accept my thanks for the complimentary package.

Respectfully yours, E. D. RICHARDSON.

William Penn Works, near Shenandoah City,

Schuylkill Co., Pa., Dec. 3, 1866.

Gents: We received our orders of Tea and Coffee all right, and each package put up so nice as to give us but little trouble. They have given great satisfaction both as regards weight and quality; and so cheap that we have saved 50% cents per lb., beside getting a better quality; and we are all satisfied that they are as good—both Tea and Coffee—as your advertisement represented them to be.

I remain, yours, THOMAS ROGERS.

Indianapolis, Ind., Dec. 7, 1866.

Great American Tea Company, 31 and 33 Vesey-st., New York: Gents: Yours of the 1st inst. is before me, and I would state that the tea has been received, and gave entire satisfaction. The money has been forwarded per Adams' Express. You may expect another order.

Respectfully, &c., WILLIS G. OVERSTREET.

Lake Forest, Dec. 12, 1866.

Proprietors Great American Tea Co., 31 and 33 Vesey-st., N. Y. Gents: The box of tea I ordered of you two weeks ago came safely to hand. All are well pleased with their goods, and their reputation have spread from house to house. Every one here now proposes to save nearly \$1.00 per pound on his teas. The Gunpowder I got I have given samples of, and all those who have tried pronounce it superior to any they have had for years. Retailing tea here now is far below par; every one says "send to New York, and save money by it." The express charges were 3 1/2 cents per pound, so we can safely say we save 50 cents per pound at \$1.25 per pound.

I send you, by this mail, another order, twice as large as the first; it is filled out in one of your blank sheets; should it not reach you, let me know immediately. Please fill order as soon as possible, for we want it before Christmas, and oblige,

J. M. SIMPSON, Lake Forest, Lake Co., Ill.

Joliet, Ill., Dec. 13, 1866.

Great American Tea Company,

31 and 33 Vesey Street, New York:

Gents: The invoice of teas you sent to me came duly to hand, and I have this day paid the amount to the express agent. So far as I have heard, all in the club are well satisfied. Already I have found others desirous of sending, and ere long I think I shall give you another order. Thanking you for the complimentary package, I am

Yours truly, F. K. BAILEY.

New Haven, Dec. 14, 1866.

To The Great American Tea Co.:

Sirs: This will convince you that your goods have given perfect satisfaction, as I have added somewhat to the club. Please accept our special thanks for the complimentary package, also for the nice manner in which the whole was put up. Yours truly,

Mrs. L. BLOSS.

Please return as soon as convenient. Direct as before to Justin Bloss, New Haven, Vermont.

N. B.—For Price List of Teas, how to get up Clubs, &c., see the last page of this paper.

THE PATENT YANKEE BLADE. STATE AND COUNTY RIGHTS for Sale.

It is the best **Seam Ripper** ever invented.
Also, a complete **Eraser**, for the Desk.
Also, a neat **Paper Cutter**.
Also, a first-rate **Letter Opener**.
Also, a capital **Nail Cleaner and Trimmer**.
Also, useful for many other purposes.
It is well recommended by *American Agriculturist*, *N. Y. Tribune*, *Independent*, *Mme. Demorest*, and hundreds more.
Thousands are in use all over the country, giving general satisfaction, and one is wanted in every family. Price, \$1 for 3, sent by mail, post-paid. Liberal discount by the quantity.
In response to many applications I now offer State and County Rights for sale on very reasonable terms. Address
W. A. FITCH,
151 Nassau-street, New York.

SOUTHWEST PACIFIC RAILROAD CO. Seven Per Cent. FIRST MORTGAGE BONDS. \$2,000,000 IN COUPON BONDS OF \$1,000 EACH. TWENTY YEARS TO RUN.

Principal and Interest Guaranteed by
the Atlantic and Pacific Railroad Co.,

And secured by property valued at \$7,500,000, consisting of 90 miles of completed road and 330,000 acres of rich agricultural and mineral lands on the line of the road. (By a provision of the mortgage, when lands are sold to the amount of \$10,000, it is to constitute a fund for the redemption of a like amount of bonds, which are also received by the Company at PAR in payment for land.) This land is now being disposed of at rates of from \$5 to \$10 per acre.

The climate is remarkably salubrious, and the mean temperature the same as in Virginia. The winters last about six weeks, and stock can be kept on the range the year through. For particulars respecting lands address Colonel A. ALBERT, Land Agent at St. Louis, Mo.

This Company has recently been merged with the Atlantic and Pacific Railroad Co., having a land grant of 55 millions of acres, thereby adding to the fullest to the security of these Bonds.

The road of the latter Company, when completed, will form a direct and continuous railway from St. Louis to San Francisco, shorter by 500 miles from New York to the Pacific than by any other route.

Of the present issue of Bonds, a limited amount is now offered for sale at the low rate of 80 per cent., subject to advance at the option of the Company.

For further particulars apply to

**WARD & CO., 51 Wall Street,
NEW YORK.**

No One Need Fear Pickpockets.

Hickman's Safety Pocket is a sure preventive against their depredations. \$1,000 will be given to any one who will successfully cut, pick or in any way purloin the contents of one. Can be attached to any garment in two minutes, are neatly made, very light, and no inconvenience whatever. Money, watches and other valuables can be secured in them, while you can go in to any crowd with entire safety. Remember, they can no more rob you than they can take the coat off your back.

Prices: Sent by mail, post-paid, Large Size, \$2.50; Small Size, \$2.00. When sent by express, and receiver paying charges, 50 cents will be deducted from each size.

LIBERAL TERMS TO DEALERS AND CANNASSERS. This Pocket is a **NECESSITY**, NO HUMBAG AND MUST TAKE.

T. S. LAMBORN, Marshalton, Chester Co., Pa.

Patent Self-Closing Pocket Books,
Pocket Memorandums and Diaries; in which a Steel Spring supercedes Elastic Bands, Tucks or Straps. A great improvement. For sale everywhere.

LAWYERS SHOULD READ THE

No. 32 Corlandt-st., New York,
(Opposite Merchants' Hotel.)

SOMETHING NEW.

Apple Catsup! Apple Catsup!

This new condiment is prepared from the pulp of the Apple, together with Spices and Vinegar. All of the materials are of the best quality, and manipulated with the greatest care in its production, combining in its manifold uses, rendering it *par excellence* in value to every house-keeper. In point of purity and flavor for giving zest and relish to food, and for healthfulness and superlative value it is not excelled by anything of the kind made, adding another economic value to that kind of all fruit, the Apple. This Catsup is made heavy and rich, and can be reduced, by adding vinegar or wine, to any quality desired. It can be used for flavoring Soups and Gravies, Oysters, Clams, Fish, Meat, &c. PRICE FIFTY CENTS PER BOTTLE. For sale by
SAMUEL T. THORBURN, 46 Hudson-st., Albany, N. Y.

LASH'S

WASHER AND WRINGER.

Best and Cheapest.

See page 72 of Feb. No. of *Agriculturist*.

J. S. LASH & CO.,
727 Market-st., Philadelphia.

CANE SEED.

Regular Sorgo, or the original Chinese Cane.

Liberian, a new and a very popular variety. Does not blow down.

Oomseana—Sometimes called the *Otaheitan*. Best for Sugar.

Neazana, or White Imphee, a short-stout cane, stands up well and is generally liked.

The Cane from which the above Seed was produced, was grown and the Seed harvested and cured under our immediate observation. The Seed is all true to the varieties designated, and absolutely free from admixture with base and worthless Canes.

The Cane from which the seed was produced yielded from two to three hundred gallons of Syrup per acre.

Send for Circular.

Marblehead Mammoth Cabbages!

As some cultivators have an impression that these cabbages cannot be fully matured outside of Marblehead, I invite their attention to the following list of weights to which they have been grown by some of my customers:

H. A. Terry, Crescent City, Iowa, has grown them weighing 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Beacom, C. W., exhibited three cabbages weighing respectively, 40, 42½ and 44 lbs. John W. Dean, St. Michaels, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., has raised them weighing 33 lbs. when trimmed. E. D. Ellis, Elma, Green, Ind., has grown them weighing over 30 lbs. A. E. Garrison, Des Moines, Iowa, has raised them weighing 30 lbs. James S. Allen, Union Springs, N. Y., has grown them weighing 30 lbs. when stripped of loose leaves. Wm. Lee, Jr., Denver City, Colorado, has grown them weighing 45 and 50 lbs., as a penalty for which the miners of the Mountains call him the "Big Cabbage Man." Collins Eaton, Ogdensburg, N. Y., has raised them weighing 50 lbs. Leonard Chout, Denver City, Col., raised one, which when trimmed of waste leaves, weighed 46 lbs. P. Sweeney, Loretto, Penn., has grown them weighing 43 lbs. Sam'l B. Ormsbee, Rolling Prairie, Wis., has raised them weighing 53 lbs. M. D. Clark, Elvira, Ohio, has grown them weighing 33 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot which weighed from 50 to 60 lbs. Hundreds of others have written me that they have taken all the prizes at the County Fairs. "Raised the largest Cabbage ever seen in the country." "Had astonished all their neighbors." "That in sweetness, crispness, and tenderness, they were unequalled." As the original introducer of the Mammoth Cabbage, I am prepared to supply pure seed in packages containing about 500 seeds, at 25 cents per package, 5 packages for \$1, and larger quantities at a proportionate discount. Catalogue of over 200 varieties of seedling many new and rare vegetables, sent gratis to any address. JAMES J. H. GREGORY, Marblehead, Mass.

WHAT EVERY FARMER WANTS—A package of My Sugar Trough Gourd Seed, 25 cts.; Tilden Tomato, 10 cts.; Drew's New Dwarf Pea, 10 cts.; Liberator Sugar Cane, 4 oz. lbs. The 4 to one address, 50c. post-paid. Send for Circular. Waldo F. Brown, Oxford, Butler Co., O.

CRANBERRY VINES.—BEST OF BEARERS.—In any quantity by the Hundred or Thousand. Dr. B. H. STEVENS, Essex, Conn.

Gregory's Seed Catalogue,

Containing One Hundred and twenty-five varieties that I grew myself, besides many kinds imported from France and England, and grown by the best seed growers in the United States. Farmers and Gardeners will find in my Catalogue many new and rare vegetables, some of which are not to be found in any other Seed Catalogue. As the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, Boston Curled Lettuce, and many other new vegetables, I invite the patronage of the public. Catalogues sent gratis to all. Those who purchased seed last season will receive it without writing for it.

JAMES J. H. GREGORY,
Marblehead, Mass.

Hovey's New Minorca Melon.

A new and extraordinary variety, weighing 20 to 30 lbs. each, with a red flush, 3 inches thick, sweet and delicious. Hardy and ripens early. Seeds 50 cents per packet. HOVEY & CO., 53 North Market-st., Boston.

PURE CANE SEED.

Regular Sorgo—By Mail, 40 cts. per lb.; by Express, 25 lbs. or less, 25 cts. per lb.; over 25 lbs., 15 cts. per lb. Liberator, Oomsecanu and Necazana—By Mail, 50 cts. per lb.; by Express, 25 lbs. or less, 30 cts. per lb.; over 25 lbs., 25 cts. per lb. Package included. Address BLYMYER, NORTON & CO., Successors to CLARK SORGO MACHINE CO., CINCINNATI, OHIO.

Extra Early York Tomato.

After testing fifteen varieties I have found none that will compare favorably with this for family and market purposes. It is very early—grows to a good market size, lays its fruit in large clusters, well open to the sun, makes but little vine, and is most remarkably prolific, having yielded the past season at the rate of 1050 bushels per acre. Packages containing over 250 seeds, 15 cents each, or 8 for \$1. Packages of Tilden's New Seedling Tomato (200 seeds), 15 cents; 8 packets for \$1. Catalogue gratis to all.

JAMES J. H. GREGORY, Marblehead, Mass.

TILDEN TOMATO.

The Originator of this Best of all Varieties, will send seed enough for 200 plants, post-paid, on receipt of 25 cents; 3 packets, 50 cents; 12 packets, \$2.00. Address HENRY TILDEN, Davenport, Iowa.

GARDEN AND FLOWER SEEDS.

A DESCRIPTIVE RETAIL CATALOGUE WITH REDUCED PRICES,

Containing practical information for cultivation, will be sent to all who apply for it.

G. R. GARRETSON, Flushing, N. Y.

Striped Leaved Japanese Maize.

Package containing about 40 seeds of this new ornamental plant sent to any address, for 25 cents. Dealers supplied with packages or sent in bulk at a liberal discount. JAMES J. H. GREGORY, Marblehead, Mass.

Potato Onion Sets!

Eleven Dollars a Barrel; Five Dollars a Bushel. JAMES J. H. GREGORY, Marblehead, Mass.

SEED POTATOES.

Early Goodrich, Harrison, Cuzco, Gleason, Coppermine, Calico, Monitor, Pinkeye-Rustycot, White Peach Blow, Fluke, Union, Holbrook, Early Cottage, Sebee, and other varieties will be mailed, in packages containing 4 pounds of either variety, post-paid to any address, upon receipt of One Dollar. For larger quantities and Circular, Address REISIG & HEXAMER, New Castle, Westchester Co., N. Y.

SEED POTATOES BY MAIL: A \$1 INVESTMENT.

E. WILLIAMS:—Dear Sir,—I planted the Early Goodrich potatoes soon after receiving them, and from the 4 lbs. raised 4½ bushels. They are a first-class table potato, earlier than the Mercer, and not more than a lb. of small ones in all I raised. The Cuzco did as well as last year, and the Coppermine a little better. I do not think the Early Goodrich can be beat in size and productiveness as an early potato, and as for a table potato it is the best I raised out of 16 kinds. Yours truly, A. E. TREADWAY, Hayre de Grace, Md. Dec. 11, '66. Address E. WILLIAMS, Montclair, N. J.

SEED POTATOES.

Early Goodrich, at \$6.50 per bbl.; Calico, also early and excellent, \$5.50 per bbl.; Gleason, late, \$3.00 per bbl.; Calico, late, \$5.00 per bbl. The above GOODRICH SEEDLINGS, raised by myself from seed first obtained from Mr. Goodrich and his successor will be furnished for cash at the prices named, and forwarded as directed by rail or express, avoiding shipments in freezing weather. EDWARD C. ALLEN, West Meriden, Conn.

SEED POTATOES.

	Per Peck.	Per Bush.	Per bbl.
Early Goodrich and Gleason.....	85 cts.	\$2.25	\$6.00
Calico.....	75 cts.	\$2.00	\$5.00

Any two or the three kinds sent in a barrel if desired. Orders filled in the order received, and the tubers forwarded by Rail or Express, as directed, as soon as all danger of freezing is past in the spring. Address G. B. TALCOTT, Oswego, Tioga Co., N. Y.

Tomatoes and Potatoes.

MAUPAY'S SUPERIOR and TILDEN, the two best market varieties. Sent by mail in 25 cent packages. GOODRICH and other seedling Potatoes. A full assortment of Garden and Field Seeds of choicest quality. Apply for Circulars. WILLIAM HACKER, Seed Grower and Importer, 363 Market Street, Philadelphia, Pa.

doct ors, bro K ers, pu B lishers T r y it.

JUCUNDA, OUR 700.—GROWN BY J. KNOX, PITTSBURGH, PA.

"The illustrations we give (as above), are drawn from Nature; and we can say, are not exaggerations of the specimens which were selected at Pittsburgh, when we were there in June, and sent to Philadelphia the next day."

"The above Engraving is a faithful representation, drawn from actual specimens of fine fruit grown on the KNOX FRUIT FARM, at Pittsburgh."

A. W. HARRISON.

"Its flowers are perfect, and fruitful to an enormous extent. I last year counted trusses that had ninety per cent. of perfect fruit upon them, as compared with the number of flowers. A most remarkable point of value in this variety is the great number of extra large berries. I saw great quantities, ten to twelve berries of which filled a pint. These, you must remember, were not merely a few selected ones for the exhibition tables, but there were bushels of them sold every day in market, which brought one dollar per quart. This is equal to four or five cents each, and may be considered rather profitable."

GEORGE M. BEELER, late Secretary Indiana Hort. Society.

"I entirely concur in the statement there made (at the meeting of the Ohio Pomological Society, held in Cincinnati, December, 1865,) as to its great productiveness, its large and uniform size, and its protracted fruitage, but, more especially, as to its brilliant color, perfect form, and extreme beauty, and consider it the most remarkable fruit of its class that has ever come under my observation."

DR. JOHN A. WARDER.

For further information, in reference to this, the most valuable of all our Strawberries, send 10 Cents for our Catalogue.

Our stock of well-rooted and vigorous plants is very large this season, which we offer at the following greatly reduced prices:

12 Plants.....	\$1.00.	1000 Plants.....	\$40.00.
100 ".....	\$5.00.	3000 ".....	\$100.00.

For Vines and Plants BY MAIL, see extraordinary inducements on page 77, February No. of *Agriculturist*.—ORDER EARLY.

SEVEN VARIETIES OF GRAPES,

which are reliable, healthy, hardy, vigorous, productive, of good quality, and very valuable.

Deliveries made in any of the principal cities of the United States.

For Information or Circulars Address

C. & J. COOPER,

Mount Vernon, Ohio.

PORTABLE SAW MILLS.—Our Medium Size Engine and Saw Mill will cut four thousand feet of Lumber per day. Price, from \$2,400 to \$2,700. Send for Circulars. We build all sizes. **JONAS W YEO,** Richmond, Ind.

North River Agricultural Works. GRIFFING & CO., Proprietors.

MANUFACTURERS AND DEALERS IN
Agricultural and Horticultural Implements,
Field, Garden and Flower Seeds,
GUANO, SUPER-PHOSPHATE OF LIME, AND PURE
GROUND BONE.

Agents for Mohawk Valley Steel Clipper Plows, Harrington's Celebrated Combined Seed Drill and Cultivator, and Sayer's Patent Horse Hoe.

Warehouse, 58 & 60 Cortlandt-st., New York.
Dealers supplied at lowest rates.

"ONE HUNDRED DOLLARS,"

Will buy a good, substantial Brick Machine, of the clay tempering kind, which is warranted to make 15,000 brick per day, of a better quality than by hand. Address,
FREY, SHECKLER & CO., Bucyrus, O.

FARMERS, DON'T FORGET Olmsed's Revolving Landside Plows.

The best and most economical implements in the world.
1st. They are the lightest Draught Plow in use.
2d. They leave the ground in the best condition for crops, thus multiplying production and saving many times their cost.

Hundreds of testimonials certify that they are better worth \$50, than an old fashioned plow is \$10.
Price, plain, \$12; full trimmed, \$18; 20 per cent. discount to dealers. We also manufacture the celebrated

Adjustable Mould Board Plows & Cultivators, Which, by a simple movement of the board, lays the furrow at any desired angle, and can be adapted to either a fast or slow team.

Price of Plows same as above. Price of Cultivators, \$7.00. Same discount to dealers.

All orders promptly executed by
JARVIS & VERPLANCK, Binghamton, N. Y.
N. B.—As heavy freights prevent shipping to a distance, we sell State, County and Shop Rights to manufacture, at reasonable rates.

For Self-Regulating Wind Mills,

For pumping water, grinding grain, and many other purposes, and for "THE AMERICAN WIND GRINDING MILL," address, **EMPIRE WIND MILL MANUFACTURING CO.,** Syracuse, N. Y.

INGERSOLL'S IMPROVED HORSE AND HAND POWER

HAY AND COTTON PRESSES.

These machines have been tested in the most thorough manner throughout this and foreign countries to the number of over 2000.

THE HORSE POWER is worked by either wheel or capstan, and in many respects possesses unequalled advantages. We invite those wanting such machines to write for a catalogue containing full information with cuts, prices, &c., or call and examine personally.

Orders promptly attended to, by addressing
INGERSOLL & DOUGHERTY, Greenpoint, Kings Co., L. I.
\$100 Will buy a good, substantial, Brick Machine of the clay tempering kind, capable of making 15,000 brick per day, of a better quality than by hand. Warranted by **FREY & SHECKLER,** Bucyrus, Ohio.

A. N. WOOD & CO., EATON, MADISON CO., N. Y.,

Continue to manufacture their Improved

PORTABLE ENGINES,

For Farm and Mechanical purposes. They are particularly adapted to driving Threshing Machines, Circular Saws, Mills of all kinds, Printing Presses, Wood or Iron Lathes, Machinery in Cabinet or Wagon Shops, Boring Artesian Wells, Pumping Water, Corn Shellers, &c., &c.
We warrant our Engines to be what we represent them, and to give unqualified satisfaction in all respects.

A. N. WOOD & CO.

THE ONLY PERFECTLY RELIABLE HAND PLANTING MACHINE.

For Corn, Sorghum or Broom Corn.

ECONOMY IS THE ORDER OF THE DAY.

WITH the JONES IMPROVED HAND CORN PLANTER, one experienced man will plant nearly or quite as much corn in a day as two hands and two horses will with a horse corn planter, and it costs less than one quarter as much. It plants and covers the corn sure every time. It plants two rows at once. Where a few were used last year, large numbers are wanted this season. It can be used as a stugle planter when desired. It has taken more premiums than any other. Price, \$12.50 each, or three for \$33.00. Small seed cup slides, 50 cents extra. Liberal discount to agricultural implement dealers, or others ordering at wholesale. Try it, and save your team and extra hand for other work.
All letters promptly answered. Manufactured by
EMERSON & CO., Rockford, Ill.
P. S.—As we are building but a limited number this season, orders should be sent early to secure the Planters.

Important to Farmers.

Will be sent anywhere free of express charges for \$3. one of McCouaughy's Patent Corn Droppers, one of the most complete machines ever invented for dropping corn, sorgho, and other seeds. Agents wanted to introduce it.
Patented March 27, 1860, and Dec. 4, 1866.
THOS. B. MCCONAUGHEY, Newark, Delaware.

WOOD & MANN STEAM ENGINE CO'S CELEBRATED PORTABLE AND STATIONARY STEAM ENGINES AND BOILERS.

FROM 4 TO 35 HORSE POWER. ALSO PORTABLE SAW MILLS.

We have the oldest, largest and most complete works in the United States, devoted exclusively to the manufacture of Portable Engines and Saw Mills, which, for simplicity, compactness, power and economy of fuel, are conceded by experts, to be superior to any ever offered to the public.

The great amount of boiler room, fire surface and cylinder area, which we give to the rated horse power, make our Engines the most powerful and cheapest in use; and they are adapted to every purpose where power is required.

All sizes constantly on hand, or furnished on short notice. Descriptive circulars, with price list, sent on application.

WOOD & MANN STEAM ENGINE CO.,

Utica, N. Y.

Branch Office, 96 Maldeu Lane, New York City.

PERUVIAN GUANO SUBSTITUTE!

BAUGH'S RAW BONE Super-Phosphate of Lime.

BAUGH & SONS,

Sole Proprietors & Manufacturers,

Delaware River Chemical Works,

PHILADELPHIA, U. S. A.

For Wheat, Rye, Barley, Corn, Oats, Potatoes, Tobacco, Buckwheat, Sorghum, Turnips, Hops, Garden Vegetables, and every Crop and Plant.

Especially recommended to the growers of Strawberries, Raspberries, Blackberries, And All Small Fruits.

MORE than 13 years of regular use upon all description of Crops grown in the Middle and Southern States, has given a high degree of popularity to this MANURE, which places its application now entirely beyond a mere experiment.

BAUGH'S RAW BONE SUPER-PHOSPHATE OF LIME,

Is eminently a success as a Substitute for Peruvian Guano and Stable Manure—and is offered to the Agriculturists of the Northern and Eastern States as a fertilizer that will cheaply restore to the Soil those essentials which have been drained from it by constant cropping and light manuring.

It is very prompt in its action—its lasting in effect to a degree unattained by any commercial manure in the market, and is afforded at much less cost than bought Stable Manure, or Peruvian Guano. The Labor involved in its use is far less than that of applying stable manure, while there is no risk from the introduction of noxious weeds.

Farmers are recommended to purchase of the dealer located in their neighborhood. In sections where no dealer is yet established, the Phosphate may be procured directly from the undersigned. A Priced Circular will be sent to all who apply.

Our NEW PAMPHLET—"How to Maintain the Fertility of American Farms"—90 pages, giving full information in regard to the use of manure, &c., will be furnished gratis on application.

BAUGH BROTHERS & CO., GENERAL WHOLESALE AGENTS, No. 181 Pearl-st. and No. 4 Cedar-st., NEW YORK.

For Sale by dealers in all parts of the United States and British Provinces, to whom Farmers will please apply.

TO FARMERS AND PLANTERS.

The Lodi Manufacturing Company, (Established since 1840), having the exclusive control of all the rights in New York City, offer for sale their Celebrated Poudrette, warranted the best fertilizer for the price in this country. Experience has shown that it has no equal for Corn, Cotton, Tobacco and Vegetables. It prevents worms from destroying the seeds. It ripens the crop from two to three weeks earlier, and adds from ½ to ½ to the yield.

It is of better quality and much finer than ever made heretofore.

Price, \$2.00 per Barrel—Cash.

The Company are also manufacturing Double Refined Poudrette, as fine as flour, concentrated and free from nearly all extraneous matter—samples of which will be sent by mail on receipt of 3-cent stamp.

It is packed in new barrels and shipped without extra charge for package or cartage in New York City.

Price for the double refined Poudrette, \$25 per Ton.

The Company's Farmers' Almanac, giving further particulars, will be sent free by addressing

THE LODI MANUFACTURING COMPANY, 69 Cortlandt-st., N. Y.

Book Agents Wanted.

To solicit orders, in each town in the United States and Canada, for the most popular subscription book ever published, being THE ILLUSTRATED HISTORY OF THE BIBLE, by John Kitto, D. D., F. S. A., Edited by Rev. Alban Bond, D. D., of Norwich, Conn.—Over 700 closely printed Royal Octavo pages—more than 100 full page engravings. Recommended by the leading Clergy of all denominations of Christians. 53,000 Copies already printed. Six large power presses running on the work. Everybody wants it. Experienced Agents say they never knew a book sell so well. No competition. Experienced Agents, School Teachers, Sabbath School Teachers, retired Clergymen, and others, are wanted to introduce this great work into every household in the land. For Circulars, etc., apply immediately to the Publisher.

HENRY BILL, Norwich, Conn.

Stereopticons and Magic Lanterns,

With the Improved Lime Light, illuminating brilliantly two hundred square feet of canvas, and magnifying the views to that size, at an expense of less than one dollar for a whole evening's exhibition. Easily managed and pays well.

Illustrated priced catalogue of the apparatus, with list of over two thousand artistically colored photographic views on glass, of the War, Scripture History, Choice Statuary, etc., etc., forwarded on application. T. H. McALLISTER, Optician, (or late firm of McAllister & Bro., Phila.,) 49 Nassau-street, New York.

(Continued from page 120, which see.)

We conceive that an elementary work on the Vine, to possess the highest practical value to the amateur, as well as the gardener and vinedresser, should treat of all the facts and principles involved in the subject, laying them clearly, in order before the student, and linking them together with just so much of the theory as is necessary to explain lucidly their relations to each other, and unite them in the mind of the student in one harmonious and systematic whole. This is what we have aimed to accomplish in the present work, indulging in no theorizing speculations, and introducing nothing of doubtful verification. We have given a simple record of our own practice and experience, stating no fact that we have not repeatedly verified, and which may not be repeated by others with like results. We have striven to make it a safe guide to all.

Although Grape Culture, and especially Wine Making, are yet in their infancy in this country, the principles and conditions upon which success depends are so well established, that, if we walk in the full light of the knowledge we have, we need tread no doubtful path. Though our work is strictly elementary, we have by no means intended to make it in any degree superficial, and we have, therefore, labored to leave no important practical question unsolved; indeed, some points, that have heretofore been entirely neglected or very briefly noticed, are here treated with a degree of minuteness somewhat commensurate with their importance, as will be seen, among others, in the chapters on "Varieties," "Ripening," and "Taste."

The engravings are so true to life, and so admirably executed, that they may be said, in some sense, to present a treatise to themselves, from which may be obtained a good knowledge of the operations to be performed, as well as the manner of doing them.

February 5, 1867.

PETER B. MEAD.

IN ONE VOLUME, BOUND IN LIBRARY LEATHER.

Price, \$6.

THE MILITARY AND NAVAL HISTORY OF THE

Rebellion in the United States,

By W. J. TENNEY,

EDITOR OF AMERICAN ANNUAL CYCLOPEDIA.

Sixth Edition.

Complete in one royal 8vo. vol., of over 800 double-column pages, illustrated with STEEL PLATE PORTRAITS, and SUPERB CHROMO-LITHOGRAPHS, printed in six colors, of BATTLE SCENES, together with ONE HUNDRED MAPS and CHARTS, indispensably requisite for such a work.

It contains an ELABORATE INDEX, enabling the reader to refer to any battle, skirmish, or other incident of the war.

The Publishers of this History do not hesitate to say that no book on the war will be found **Fuller, More Reliable, or More Beautifully Illustrated**. It is in fact a necessary desideratum for every one who desires to make himself familiar with the operations of one of the most gigantic wars that has ever occurred in the world's history.

It is printed on paper of excellent quality, in good, clear type, elegantly and substantially bound.

Agents Wanted, to whom exclusive territory will be given, some of the best locations being still unoccupied. Good Agents are clearing \$100 per week.

D. APPLETON & CO., Publishers, 423 and 445 Broadway, New York.

HOW TO RAISE 100 BUSHELS OF CORN TO THE ACRE, or a good crop on any soil, with Useful and Practical Hints to every Farmer. By R. P. PROSSER. Sent free by mail for 25 cents, six copies for \$1. H. WATKIN, Publisher, 230 Walnut Street, Cincinnati, O.

LUMBER AND LOG BOOK.

Scribner's Ready Reckoner, designed expressly for lumber merchants, ship-builders, and farmers, containing the correct measurement of Scantling, Boards, Plank, Cubical contents of Square and Round Timber, Saw Logs, Wood, &c.; comprised in a number of tables, to which are added Tables of Wages by the month, Board or Rent by the week or day, Interest Tables, &c.

This is the most complete and reliable book of its kind ever published, and has now become the standard book for lumber dealers all over the United States. Over 300,000 copies have been sold and the demand is constantly increasing. Every one engaged in buying or selling lumber of any kind will find this a very valuable book.

The book is for sale by booksellers throughout the United States, and sent by mail, post-paid, for 30 cents.

GEO. W. FISHER, Publisher, Rochester, N. Y.

EMPLOYMENT.

THE AUBURN PUBLISHING CO. offer THE BEST HISTORY OF THE REBELLION. Latest, Cheapest, most Complete.

TO BOOK AGENTS.—We are now ready to employ additional Canvassers for GREELEY'S HISTORY

complete. The popularity of this work is unprecedented. For more than four months past the demand has far exceeded our utmost ability to supply, although we have printed and bound a much greater number of volumes than were ever before issued of any single work in so short a time and of equal size in the whole history of book-making. The great superiority of GREELEY'S HISTORY is everywhere admitted, even by the author's political opponents. Experienced Canvassers can secure good territory on favorable terms. Address O. D. CASE & CO., Hartford, Conn., Cleveland, O., or Detroit, Mich.

INSTITUTE OF DRAWING, SURVEYING, and Civil Engineering, at Tolleston, Lake Co., Ind. Opens April 15th. It costs \$30 to be a Draftsman; \$30 a Surveyor; \$60 a Civil Engineer. Address A. VANDER NAILLEN, for a Circular.

(Business Notices \$2.50 per Agate Line of Space.)

The Immense Profits OF THE TEA TRADE.

The Proprietors of "THE GREAT AMERICAN TEA COMPANY," became fully convinced, several years ago, that the consumers of Tea and Coffee were paying too many and too large profits, on these articles of every day consumption, and therefore organized THE GREAT AMERICAN TEA COMPANY, to do away, as far as possible, with these enormous drains upon the Consumers, and to supply them with these necessities at the smallest possible price.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for all the profit he can get.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

Some parties inquired of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

The Company have selected the following kinds from their Stock, which they recommend to meet the wants of clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the List of prices will show.

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for clubs of less than \$30.

All goods sold are warranted to give satisfaction.

PRICE LIST:

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

MIXED, 70c., 80c., 90c., best \$1 per pound.

JAPAN, \$1, \$1.10, best \$1.25 per pound.

COLONG (Black), 70c., 80c., 90c., best \$1 per pound.

IMPERIAL (Green), best \$1.25 per pound.

ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

GUNPOWDER (Gunpowder), \$1.25, best \$1.50 per lb.

P. S.—All towns, villages, or manufactories, where a large number of men are engaged, by clustering together, can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,
31 and 33 VESSEY STREET, corner of Church.
Post Office Box, 5,643 New-York City.

We call special notice to the fact that our Vessey Street Store is at Nos. 31 and 33 Vessey Street, corner of Church Street—large double store.

From the Methodist, N. Y. City.

THE GREAT AMERICAN TEA COMPANY.—In noticing the operations of this large and enterprising establishment, it may be proper for us to offer a remark in explanation of the reasons which induce us to call the attention of the community to a concern which has reached its eminence in public favor. It is our undeviating rule to exercise a scrupulous judgment in relation to business enterprises—never recommending any except such as we believe have been proved worthy and reliable, and whose system of business, uprightness of dealing with their customers, and ample capital to fulfill their engagements are fully established. Upon these principles we call attention to the advertisement of the GREAT AMERICAN TEA COMPANY, published in our advertising columns. The Company have several very large stores, located in different parts of the city, stocked with the best and most serviceable goods, which they are content to sell at merely living profits, as they have proved by their prices for the past five or six years. They have but one price, which is no small consideration to those who are dependent to any considerable degree upon servants or children to make purchases, or to those who wish to order from the country. By these rules alone the company propose in the future to conduct their vast and rapidly augmenting trade. Believing that the ability and disposition of the Company are ample to perform all they promise, warrants us in calling special attention to them in our columns. It is a trite saying "that the honest strivings of honest men are sure to be commended, their business efforts encouraged, and ultimately adequately compensated."

Clergymen and Gentlemen of the religious and secular press of very careful speech, have emphatically indorsed and recommended the GREAT AMERICAN TEA COMPANY, as also commendatory letters of our customers.

On page 110 of this paper, we give their own words, so that consumers of Tea may rely upon our statements and manner of doing business.

VALUABLE PUBLICATIONS

BY

LUTHER TUCKER & SON, ALBANY, N. Y.

"The Cultivator and Country Gentleman"—a LARGE WEEKLY JOURNAL, 16 pages quarto, devoted to the Practice and Science of Agriculture and Horticulture at large, and to all the various Departments of Rural and Domestic Economy. Only \$2.50 per year, with favorable Terms to Clubs.

* * * SPECIMEN COPIES sent free, or on receipt of 30 cents, we will forward the Five Numbers for January, stitched and trimmed in paper cover, post-paid—80 pages, and very cheap at the price.

"Rural Affairs," in FOUR HANDSOME VOLUMES, muslin, containing about 1300 pages of Reading Matter, and over 1700 Engravings, including all Agricultural and Horticultural Subjects, and very valuable PLANS OF FARM AND COUNTRY HOUSES, and Outbuildings.

* * * Sent postage paid for \$6, or either Volume alone for \$1.50.—Send for one and you will want all. Address, with remittances, or for further information, LUTHER TUCKER & SON, ALBANY, N. Y.

Imported Crevecoeur Fowls,

Direct from the Jardin d'Acclimation, Paris, selected with great care; the finest in the country. Orders received for fowls only, progeny of above, to be delivered after Sept. 1st. Send for Circular. Also, limited number of

HOUDANS,

of same importation.

DUCKS.

Plata and Aylesbury Ducks and Eggs from the best imported Stock. Send for Circular.

A. M. HALSTED & CO., 63 Pearl St., New York.

To Farmers and Agents.

On receipt of \$1.50 we will send by mail or express, prepaid, the Brass Metallic parts, or for \$2.00 one of the Celebrated Silvers' Patent Excelsior Brooms complete—with full instructions how to fill it.—Universally acknowledged to be the cheapest, best and most beautiful Broom in the world, and the only one accepted for the "Paris Exposition" of 1867. An Agent wanted in every country. For full particulars, see February Agriculturist, page 77, or send for Illustrated Circular to C. A. CLEGG & CO., 206 Broadway, N. Y.

KNOX'S NURSERY AT YOUR DOOR.—A Liberal Offer. See Advertisement on page 117.

SOUTHERN LANDS.

Great Bargains in Maryland, Virginia and Cotton growing States. Farms of all sizes and at all prices, from \$2 to \$50 per acre. Large Tracts of Timber on Railroad and Water. Never failing Water Powers, Mill Sites, etc., etc.

For sale by WM. H. NEWTON, Atty and Broker, 23 Lexington-st., Baltimore, Maryland.
Send 25 Cents for Catalogue.

GET WELL AND KEEP WELL.—Read the Advertisement of Herald of Health, page 112.

See Advertisement "ALL NURSERIES IN ONE," on page 112. Observe the low Prices.

MR. GREELEY'S PROPOSITION FOR GRAPE PRIZE.

So much has been well done within the last few years in American Fruit growing that it seems feasible, to do still more or at least to realize more extensively and rapidly the benefit of past improvements. Perhaps the most signal improvement has been made in the production of Grapes. Still, we are growing far too many inferior grapes, while our established favorites are too generally deficient in one or more respects. * * * They have none notable defect as a table fruit. * * * But it is plausibly claimed that several substantially new or little known varieties of domestic origin of high quality, fulfill all the requisites of a choice table fruit. It is time these claims were tested and passed upon by disinterested and capable judges. As a humble contribution to this end, I hereby offer a premium of One hundred dollars for the best plate of native grapes, weighing not less than six pounds of any variety known to the growers or propagators of the country. I require as follows of the grapes competing for the premium: The berries must be at least of good medium size, and not liable to fall from the stem when ripe: The flesh must be melting and tender quite to the center: The flavor must be pure, vinous, and exhilarating: The vine must be healthy, productive, of good habit of growth for training in gardens and yards, as well as in vineyards, with leaves as hardy and well adapted to our climate as those of the Delaware. In short, what is sought is a vine embodying all of the best qualities of the most approved American and foreign varieties so far as possible.

I propose to pay this premium on the Award of the Fruit Department of the American Institute, and invite competition for it at the annual fair of the Institute soon to open; but if a thoroughly satisfactory Grape should not now be presented, the Institute will of course postpone the award till the proper claimant shall have appeared.

Signed,

HORACE GREELEY.

The Committee, consisting of Peter B. Mead, Chairman, R. G. Pardee and Francis Brill, reported (see report in pamphlet) that "the Iona fully met Mr. Greeley's requirements, and that no other grape in cultivation could."

[This the committee knew to be true in Sept., 1864, and thousands of others in all parts of the country now affirm the same from their own experience.]

This appears to be the only committee that ever adjudicated the Greeley prize, although another committee, or rather a portion of it (apparently after enjoying a party and forgetting their errand) made another report, which embodies an apology for giving it to so poor a grape as the Concord. See what one of them at the late meeting "of Fruit-growers Society of Western N. Y." says about it when asked to explain.

Extract from letter giving report: "The Concord ripened well, but the berries fell from the bunch some, and I don't think so much of it on that account. There are several grapes that I always eat in preference to the Concord—in fact, I select, eat and like—but the public—the great masses—are not so well educated in their taste, and are ready to gulp down any black grape of good size, regardless of quality. For that reason I recommended the Concord for the Million." Mr. William Griffith, of North East, Pa., who believed the Iona best of all grapes for table and for wine, denounced the doctrine of Mr. Committee-man, saying (the committee-man) little knew the American people, and closed by saying "that 999,000 out of every million and part of the other thousand were already dissatisfied with that award, and that 'the million' in all coming years would rebuke the finding of that Greeley Committee." (It is also stated that only three of the Committee ever saw the grapes last fall, on exhibition for the premium.) The Convention, on voting for "best variety," gave one vote for Concord—the man explained "that it was because the birds wouldn't touch that."

Mr. F. R. Elliot (Author of Fruit Growers' Guide) said, "of all the grapes that had had any reputation at the West, Concord was the poorest in quality."

It will be seen that Mr. Greeley's requirements specify very judiciously and accurately the distinctive qualities of a good grape, without which his offer of a munificent premium would have been entirely wanting in that clear significance and practical good sense, for which he is so eminently distinguished. It was not to have been expected that any one of Concord's "hundred head of friends" should have placed before the public an analysis of the qualities of a good grape such golden harvests, which could last only while the "ignorance of the million" should continue, but when we consider how utterly wanting in all of these essential qualities the Concord is, and in fitness for "Market" also, we cannot fail to wonder that the portion of the committee reporting should omit to state such important facts, to avoid the appearance of collusion with whom it was regarded as the most enormous swindle that has been perpetrated in fruit-culture, when the history of the dissemination of the Concord shall be known. The latter is in very unenviable contrast with the former committee.

Now, Mr. Public, we have finished our little essay, and at an expenditure of some thousands of dollars have spread it before you. Please let some one of your philosophers weigh it in his scales, using for weights all that has appeared on the subject of grapes in all of the magazines and papers during the past three years.—Note the result and make your calculations accordingly.

C. W. GRANT.

MEAD ON GRAPE CULTURE AND WINE MAKING.

Harper and Brother will publish, on or before the first of March, "American Grape Culture," an elementary work, by Peter B. Mead, intended specially to meet the wants of the present time.

It is the work of a thorough practitioner of the most extended knowledge of the subject, and who, at the same time, is able to express his ideas in a clear, intelligent, and scholarly manner.

The work is most profusely illustrated with the best engravings ever published for the purpose, and we are happy to be able to offer it so opportunely to the American public.

HARPER & BROTHER,

Franklin Square, N. Y.

Sent by mail on receipt of price.

PREFACE.

The present volume has been prepared in compliance with the urgent request of friends in various parts of the country.

(Continued on page 119, which see.)

[COPYRIGHT SECURED.]

SOUTHDOWN RAM.—PROPERTY OF AMASA BEMIS & SON, SOUTH BURKE, VT.—*Drawn from Life and Engraved for the American Agriculturist.*

Every lover of good mutton has an affection for anything that looks like a Southdown Sheep. Among the Southdowns there is an aristocracy of pedigree, form and excellence, and so we honor the name of Jonas Webb, of Babraham, England, as a benefactor of the race, on account of the degree of excellence to which his careful breeding brought this favorite mutton breed.

The Ram above portrayed was sketched by our artist at the New England and Vermont

Fair last fall, as the winner of the first prize in his class. He is known as "No. 19" of Bemis & Son's flock; is three years old; was bred by J. C. Taylor of some of his best stock, imported in 1860. Mr. T. having secured at Mr. Webb's sale the very choice ones of the flock. This blood tells wherever it has been scattered,—even where it is used upon common flocks, and the grades show little of the Southdown look. The butcher's knife develops the beautifully

marbled chops and thick loins which characterize the breed. Southdown mutton, or that of grade Southdowns, always commands the very highest market price in all our large cities. In fact, it is rarely found in the common markets—the sheep being sold to butchers having private stalls. In New York good Southdown mutton brings a price at retail equal to good beef. Early lambs, half Southdown, meet a quick market from green-pea time until late in the season.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, APRIL, 1867.

Extreme views and practices are held and followed with small profit to any one, and least of all to him who suddenly adopts them. However at variance any man's system of farming is with sound philosophy, if he has hitherto met with any sort of success, and is not absolutely running backward, we would surely not advise him to cast loose from his moorings and adopt all new practices, to accord with the views of a sounder agricultural faith, to which he may have become a convert. Rashness is the usual precursor of failure, but progressive conservatism uniformly leads to success. Deep plowing is an excellent practice, but only when there is a soil to plow. He who lifts several inches of untempered subsoil and mingles it with a shallow surface soil, will repent his deed when the sickly, yellow grain testifies to the poison presented to the plants with their food, or to the difficulty they have in picking up a living among the mass of rubbish. In the spring, especially, the soil should not be plowed much deeper than heretofore. In the autumn the plow may very well be put down quite deeply, provided there is enough plant food in the soil, or added to it, to warrant it; for the freezing and thawing of winter, and the action of the atmosphere will essentially modify its character. These influences are wanting at this season, and deeper plowing than usual must either be accompanied with thorough liming or the use of unleached ashes, or very heavy manuring; and even then it is not to be recommended for small grains. It is well, however, at every plowing to run the plow a little deeper than before; and if the soil is neither water soaked nor leachy, even quite shallow subsoiling will prove of great benefit. We advocate most earnestly deepening of the soil, but not rashly, nor too much in spring plowing.

The failures of certain crops year after year admonish us not to put our trust too much in any single staple. Influences, which are injurious to one class of crops, benefit others, and so, judiciously dividing our interests, we are surer of success.

Double cropping of the land is one of the essential features of "high" or "intensive" farming. It is equivalent to getting double interest for the money invested in the land, and in the labor of weeding and clearing the same, and for the buildings, fences, roads and superintendence of the farm, it gives quicker returns for the investment in manure, and in all points is a great gain. It requires that the land should be rich and in good tilth, reasonably free from weeds, and that there should be a proper rotation of crops followed, and labor enough at command. It affords also a means of profitably employing many hands the season through, for whom there would otherwise be little to do most of the time. The practice should be commenced in the garden and extended to the field, when familiarity has given confidence in it.

We entreat farmers not to neglect their gardens. Many are too apt to read the hints about farm work and slight the other columns. The kitchen garden, if well cultivated, better rewards labor than any portion of the farm of five times its extent.

Hints About Work.

Review the hints for last month; many of them will be found equally applicable to this, especially if the season be backward. Besides, the weather of March, in the latitude of Philadelphia and St. Louis, is that of April near Boston or St. Paul.

Tillage.—The preparation of the soil for the seed is the important work of this month. Manure is to be hauled and spread, and the ground is to be plowed. The waste of manure which occurs after it is spread is very little in weather which will not allow plowing, and not very great in full, hot sunshine, if it does not lie long. It is much worse to dump the manure in small heaps and leave it for some time exposed to the action of rains, for the

goodness washes out into the soil and enriches it in spots, to the serious damage of the crop.

Plowing and any other working of the soil should never be done when the clods will not crumble. Dryness is essential to useful tillage. It is much better to delay work than to leave the land lumpy and hard. There are many spots on which

Draining may be done in the spring—especially where there is a good fall, and work may progress from the outlet. The necessity for drainage is now obvious, and though partial drainage is never to be recommended where thorough work will be undertaken, yet as a demonstration of the fact that "burying crockery" will pay, it is worth while often to try the experiment "just to see." Remember that the full effects of draining are often not witnessed until the third or fourth season.

Spring Grains.—Prepare seed by selecting with the fan-mill the heaviest grain—the more times it is fanned, the better will be the seed; then, when the soil is nearly or quite ready, prepare the seed by pickling to destroy the seed of smut, which may be attached to it. This is useful for barley, and imperatively necessary for wheat. Add to a strong brine pulverized "blue stone," (sulphate of copper,) until no more is dissolved; into this throw the grain, stir thoroughly, and after five minutes scoop it out, throw into a basket, let it drip back into the tub of pickle, then put in a heap upon a floor; after 24 hours shovel it over, sprinkling on dry slaked lime, thus drying it. Sow 5 to 7 pecks of wheat, 2 bushels to 2½ of barley, 2½ of oats. The ground should have been plowed in the fall for wheat and barley. Oats do tolerably well on a sward plowed in spring. For all either very fine compost or some concentrated fertilizer, such as a mixture of superphosphate of lime and Peruvian guano—say 100 lbs. of each—should be used. Sow, as a rule, those kinds of grain which are in highest repute in your own neighborhoods.

Root Crops.—Prepare the soil for sowing carrots, beets and mangels, and onions, the earlier the better. It should be deep and rich, plowed in the fall and as free from weeds as possible, especially for onions, which require the finest and mellowest soil, enriched with good, fine compost. The other root crops need also rich soil, deeper than onion soil, but not less rich, though the enrichment need not be of so fine a quality. These crops can not be sown too early, after danger for hard freezing is passed and the soil is warm and dry enough. Beets need ought to be soaked 24 hours.

Potatoes.—At least a portion of the crop should be planted very early for security against the rot. The Early Cottage, White Peachblow, Onzeo and Fluke are commendable kinds. Plant deep, in drills 2½ to 3 feet apart, cover with the plow. Harrow as often as weeds appear, until the tops show very plainly, and once after that, driving with the rows. It is sometimes well to turn furrows upon the rows to cover them a few days after this, and when a new crop of weeds appears to harrow again. Superphosphate, castor pomace, leached or unleached ashes are good used in the drill. It is usually poor practice to plant in hills.

Peas.—See notes for last month.

Pea Nuts or Ground Nuts, for profitable culture, require a rather long season. Sow in rows three to four feet apart in deep, mellow, rather sandy soil, in a good condition; drop two shelled kernels in a hill, and put the hills one foot apart. Plant as early as there is a chance for the young plants to escape frosts, to which they are as sensitive as beans—cover two inches deep. Use horse hoes at first, and hand hoes after they begin to run. At all events keep the weeds down. After first hoeing, thin to one plant in each hill. Crop, in the warmer States, 50 to 150 bushels per acre.

Flax.—See pamphlet "Flax Culture." Sow on very mellow soil, free from weeds, one and a half bushels per acre, (for seed and lint both,) as evenly as possible. Selecting the heaviest seed, soak in warm water two or three hours, roll in gypsum and sow two ways. Cover with a brush or light harrow.

Manure makes fast in compost heaps, if oc-

easionally worked over with the addition of muck or any vegetable mold, and thus the quantity available for corn may be greatly increased.

Liquid Manure has great effect upon grass, and no better application can be made upon winter grain, though the labor attending its application is considerable. A liquid manure distributor is a rare, but needed, article on American farms. In buying

Concentrated Manures do not purchase any because they are cheap. The adulteration of guano is notorious. The farmer can much better afford to mix in the sand on his own farm than to pay \$65 in gold a ton for sand, and cart it a dozen miles besides. The other popular manures, superphosphate, etc., are quite as liable to adulteration, or even more so. After all, it is best to make one's own fertilizers, or buy only of reliable parties.

Home-made Fertilizers.—1st, Poudrette. Mix dry soil, muck or peat with the contents of the privy every three days, remove and work over the contents, once a fortnight adding more. 2d, Guano. Sprinkle plaster under the hen-roosts, and also earth or muck, cleaning all out once a week. Mix in a dry place, moistening with chamber ley, barnyard leavings, or simply water, and cover the heap with soil pressed down. Work over, adding more soil, or muck and plaster, as often as it heats well.

Horses.—Feed according to the amount of labor required of them. Groom daily and thoroughly. Give air and sunlight in the stables, feed and water regularly, blanket only when exposed after labor.

Oxen.—See hints for March. Warbles, or grubs in the back, often become very obvious at this season and later; destroy such as show their heads. We have never known of harm to result from killing the grubs by pressure or by puncturing the skin before their heads protrude. Feed grain if hard worked, and do not neglect carding regularly.

Cows and Calves.—If allowed to run together, it is best to put two calves upon one cow, as a rule, and to have these of different ages, so that both shall not be removed at once when fit for veal. The calves should be fed gruel besides, and some veal raisers allow them free access to dry corn meal, or better, linseed-cake meal, and corn meal mixed.

Sheep.—Give ewes and lambs the attention they require at lambing time. The flock should have the personal supervision of the owner. Give, if possible, shelter of some sort, and at least keep the flock of ewes as near as possible to the house and closely watched. Distribute the lambs among the ewes having most milk, not necessarily leaving twins with their own dams.

Swine.—See hints in former numbers for treatment of breeding sows. Employ all hogs in making manure, supplying sods and all vegetable refuse.

Work in the Horticultural Departments.

Frequent showers and the increasing warmth of the sun remove the last vestiges of snow and ice, and this is emphatically a working month. As so many things have to be hinted at this month, we shall assume that preparatory work is generally done or in progress, and refer the reader to preceding months for whatever relates to that.

Orchard and Nursery.

Assuming that the land for the new orchard has been plowed and subsoiled, and if need be, drained, and that the needed trees have been ordered.

Planting may be done as soon as the trees come to hand. Do not leave the roots exposed any longer than necessary, and if planting can not be done at once, cover the roots with earth. Trim mutilated roots, shorten the tops and, at the same time, remove useless branches. Do not plant too deeply; make a broad opening for the roots, spread them in a natural position, cover with fine soil, press it down firmly with the foot, and the tree will not need to be staked to keep it in position.

Shrivelled Trees are to be buried, root and branch, until the bark becomes plump, and those that have

started in the package, must be cut back severely.

Old Orchards are often brought in a state of fruitfulness by generous manuring and cultivation.

Grafting may be carried on as soon as the buds begin to swell. It is better to wait for the first indications of life in the tree than to do it earlier. Clions may be cut if the buds have not started.

Root Grafts should be planted in nursery rows as soon as the soil is in proper condition.

Seeds and Pits, for raising young nursery stock, are to be sown as early as possible. Peaches that have been buried in heaps, should be looked to. If they were dried too long before they were put with earth, they will need to be carefully cracked.

Insects.—Continue to destroy eggs, and use the soap wash heretofore recommended. When protectors are used to stop the ascent of the Canker-worm, see that the tar, oil, or other adhesive material is properly renewed. See p. 102, last month.

Fruit Garden.

Planting, grafting and general care of trees in the fruit garden is the same as for those in the orchard. Only dwarf trees are in place here, and they should be models of health and fruitfulness. Those who wish to try at the different methods of training, should consult Rivers' *Miniature Fruit Garden*.

Figs may be ripened in well sheltered gardens, but they must be taken up and wintered in the cellar, or be laid down and well protected with earth.

Quinces, so beautiful whether in flower or in fruit, may be trained to form handsome pyramids, if the leading branch be kept tied up to a stake.

Currants should be in abundance in every family garden. They will bear under neglect, but will amply repay manuring and care. The Cherry and White Grape are the best; there is a great confusion in names, and any of the large fruited sorts are good.

Gooseberries.—Houghton and the American Seedling are the common sorts free from mildew, and are more valuable green than when ripe.

Blackberries are now considered necessary in the garden. The Kittatinny and Wilson's Early are the newest sorts, and both good. Dorchester and New Rochelle are older sorts.

Raspberries.—New varieties are so numerous that it is difficult to say which is best for general cultivation. The finest sorts all need covering in winter. The Black-caps are hardy and popular.

Grapes.—Plant strong one or two year old vines on well drained soil, and allow only a single cane to grow the first year. We have given considerable space of late to the discussion of the leading varieties. A garden of considerable extent should contain several of the standard sorts.

Strawberries.—Remove the mulch from over the crowns, but leave the ground covered. Set new beds as soon as the soil can be worked. For garden culture, beds 4 feet wide are the best; one row of plants in the center and a row 18 inches from it on each side. The plants may be from a foot to 18 inches in the row, according to their habit of growth; the latter distance is none too much for the strong growing kinds that make large stools.

Kitchen Garden.

Many of the hints of last month will be timely now. The care there suggested in the management of glass is more necessary now, as the plants are more liable to suffer from extremes of heat and cold.

Asparagus.—Fork over the beds if not already done, and if new plantations are needed, make early, as directed last month. Treat beds of

Rhubarb in a similar manner; both do much better when planted early before the growth starts.

Beans may be planted where there is no longer danger of frost, but it is generally too early at the North. The Early Valentine is a favorite garden sort.

Beets.—Sow in rows a foot or 15 inches apart, or, if preferred, two feet apart, with radishes between. Several early kinds are better than the old Bassano.

Cabbages.—Set out the plants from cold frames.

Our market gardeners put the rows 24 to 28 inches apart, with the plants sixteen inches in the rows, and then set lettuce in rows equi-distant between the cabbages, but this economy of land is not usually necessary in private gardens. Harden off the plants in hot-beds by exposure. Sow seeds in open ground in drills 4 inches apart, and sprinkle with flour of bone or air slacked lime as soon as up. The Wakefield and Early York are the most common early sorts, and there are several other and newer kinds described in the catalogues.

Cauliflower is planted and treated same as cabbage.

Carrots.—Sow Early Horn in 15-inch drills, using plenty of seed to ensure a good start.

Celery.—Sow seed in a rich, mellow soil, in drills 8 inches apart—cover lightly with soil.

Chives.—Propagate by breaking up the old clumps and setting the bulbs 6 inches apart.

Cress.—Whoever would keep up a supply of this pungent salad—well called pepper grass—should make a sowing every eight or ten days.

Cucumbers may be sown in cold frames from which other plants have been removed. Next month will be early enough to start on sods under glass those to be planted in the open ground.

Egg Plant.—Sow in hot-bed and keep warm. They are slow to recover if they once get chilled.

Garlic.—Break up the bulbs into sets and plant 6 inches apart in rows a foot apart.

Horseradish.—See very full article on page 141.

Herbs.—Have a plenty of these for home use or for market. Thyme, Sage, Sweet Marjoram, and Summer Savory are the most used. Prepare a bed of rich and finely worked soil, and sow seeds in rows 4 inches apart, and keep free of weeds.

Leeks.—Sow in rows a foot apart, in fine rich soil, and keep clear of weeds from the start.

Lettuce.—Set out plants from cold frames one foot apart each way, or the same distance between rows of early cabbages. Sow in the open ground in drills 3 inches apart. The Curled Silesia is most commonly used, but many prefer a variety of it, the Curled Simpson, as it is rather earlier.

Mustard.—For salads sow thickly in foot rows.

Onions.—Sets are put out as early as the ground can be worked. If the onions are to be pulled green, the rows may be 9 inches apart, but if they are to be left to ripen, make them 15 inches. Potato and Top Onions are also to be put at this distance. Put the sets 3 or 4 inches apart in the rows, cover, and roll. Seeds, or "black seed" as it is often called, is sown in 15-inch drills in highly manured soil. Onion sets are raised by planting the seed very thickly in rather wide 9-inch rows in poor soil.

Parsley.—For early, sow in cold frames between the rows of lettuce; for later, sow in the open ground in rows a foot apart. It germinates slowly.

Parsnips.—Sow in deep soil in rows 15 inches apart. Be sure that the seed is of last year's growth.

Peas.—The early and "extra early" kinds are so numerous that one is at loss to choose between them. Dan. O'Rourke is the old standard sort. Some of the dwarfs are very convenient for garden culture, but the taller kinds are more prolific. Tom Thumb and other dwarfs may be sown in rows a foot apart. The taller growing kinds are usually put 3 or 4 feet apart, and supplied with brush before they are tall enough to fall over.

Peppers.—Sow Squash and Mountain Sweet varieties in hot-bed, and treat the same as egg plants.

Potatoes.—The Early Goodrich is perhaps the best for garden culture. Plant this, or other early sort, in well manured soil in drills 6 inches deep and 2 feet apart; drop seed—cut or not, as may be preferred—a foot apart in the drills.

Radishes.—Sow in any spare spaces in the frames, or in light soil in the open ground. Market growers, after sowing their beets, sow the ground broadcast with radish seed. The radishes come off by the time the beets are large enough to thin. The Scarlet Turnip and the Scarlet Short Top are among the best. The French Breakfast is a new sort.

Salsify.—Sow and treat the same as carrots. The same culture for Scorzonera, or Black Salsify.

Sea Kale.—A plant, the young shoots of which are eaten. A perennial, and grown in beds much in the way of asparagus. The plants are started from seed sown this month; keep well weeded.

Spinach.—The plants wintered over may be thinned for use. Sow seed in 15-inch drills.

Seeds.—Whatever roots, bulbs, etc., are to produce seed should be looked over, the best specimens selected and set in a rich soil. Keep related varieties at a good distance from one another.

Swiss Chard.—Excellent for greens, and is grown the same as the beet, of which it is a variety, with large and catable leaves which are cooked as spinach.

Sweet Potatoes.—The manner of starting these without a regular hot-bed is given on page 143. Those who have a hot-bed have only to lay the potatoes on the rich mould of the bed and cover them with 2 inches of rich compost. Those who wish only a few plants had better buy of those who advertise them for sale. They go well by express.

Tomatoes.—Those well up in the hot-beds should be transplanted to another hot-bed or potted, and kept under glass. Seeds may be sown under glass.

Turnips.—Sow early varieties as directed for beets, on light, well enriched soil.

Window Boxes, as we have often mentioned, are very useful in getting a few early plants. A box 5 or 6 inches deep, filled with good soil, and set in the kitchen window, will give quite a stock of young plants. The box may be set out in the sun for a few hours during the warm portion of the day.

Flower Garden and Lawn.

The preparatory work of road and path making, and repairing old walks, should be out of the way, as the ground will be in good condition to be forked over for planting. In old beds it is well to take out a portion of the earth and replace it with some fresh soil from a pasture. In all planting of

Ornamental Trees, take as much pains in the preparation of the soil and the tree as if it were a choice fruit tree. A single specimen is in small places often better than several. The Weeping and Copper Beech, the Cut-leaved Birch, and a score of others among deciduous trees, make glorious specimens. Don't plant exactly such varieties as your neighbor has. In many of our villages one person sets the fashion and all others copy it. The custom of staking the trees is a bad one, but if they need to be anchored put some large stones over the roots. Then have plenty of

Shrubs.—There are so many beautiful ones that we are at a loss to designate them. Everyone wants Lilacs and Snowballs, just for the old associations, and does not wish to be without Weigalas, Japan Quince, Spiraeas, and a host of others, native and exotic. Where, to make a division,

Hedges are desirable, it is for the most part best to use evergreens, as they are pleasing all the year round, but if deciduous ones are preferred, set them early. If properly attended to, any woody thing, from a beech tree to a barberry bush, will make a garden hedge, and if neglected, nothing will make a hedge of its own accord. The Japan Quince is very ornamental as a hedge, and when in flower, is in a blaze of glory. Most of the line

Edgings, as a general thing, are an abomination. Nothing is neater when well kept, but they are so seldom seen thus. Reset box, digging a trench with one perpendicular side, and split up the old plants, preserving as much root as possible to the divisions. Set them regularly, crowd the earth against them firmly, and clip the tops evenly to about two inches. Why don't some one make a cheap and neat edging tile and advertise it?

Roses, for general culture, should always be on their own roots. The catalogues give the varieties. The "perpetuals" are not perpetual at all, but the China sorts bloom all summer, though they are not hardy in winter. Don't forget the various

Climbing Roses and Wistarias, Honeysuckles, Clematises and other vines. The old clumps of

Herbaceous Plants, such as Phloxes, Dicentra, and

others, if they have become large, should be divided and reset. Those from seed last year, as well as

Biennials, such as Sweet Williams, Hollyhocks, etc., must be transplanted to the borders.

Hardy Annuals are to be sown early. By a ridiculous misprint we were made, last month, to say that they "do best when warm as soon as the frost leaves," when we wrote it **sown**, and very plainly. By hardy annuals, we mean Larkspurs, Gillias, Whitlavias, Caudytuffs, Sweet Alyssums, and all things that come readily from seeds that were self-sown last season. Sow seeds of

Tender Annuals, such as Asters, Balsams, Everlasting flowers, etc., under glass, or in window boxes. The coverings should be gradually removed, as the weather gets warmer, from the beds of

Bulbs, to give Hyacinths, Crown Imperials, and the rest of them, a chance to show themselves. Do not be too anxious to get out

Bedding Plants that have been raised in the atmosphere of a green-house; they are generally warm weather plants, and stand still in cool weather.

Buying Plants.—Those who live near towns and cities will often be tempted to buy plants that have been forced. Many of our common herbaceous plants are potted and forced. These plants are at their best when you buy them, and you will get no more satisfaction from them this year.

Green and Hot-Houses.

As the plants will all go out of the green-house as soon as the weather suits, they should be gradually hardened off by abundant ventilation at all seasonable times, at the same time avoiding the ill effects of the sudden changes of temperature.

Camellias, making their new growth, need more warmth. Keep them free of insects.

Pelargoniums now coming into flower, should have all possible light, and a plenty of water, as should other plants now blooming.

Propagating of bedding stuff for out of door planting, should be pushed rapidly. The great element of "luck" is to keep the air of the house 10° to 15° cooler than the sand on the bench. If potted cuttings have filled the pots with roots, shake out the earth and repot in the same pots. Sow

Seeds of those annuals that have very fine seeds, such as Lobelias, in pots or pans with scarcely any covering of earth. Put the roots of

Dahlias in a warm place where they will sprout.

Cannas and *Colocasias*, or *Caladium esculentum*, so valuable as foliage plants, may be forwarded.

*Tuberose*s.—Usually very unsatisfactory if put out as dry bulbs, if started with a little heat, and then planted out in warm weather, will flower finely.

Plants in Pots and Frames must not be allowed to suffer by being kept too close, nor for want of water.

Cold Grapery.

April is usually the month for uncovering and putting up the vines. In order to insure an even breaking of the buds along the whole length of the vine, it is not put up in place at once, but is suspended so that the upper end shall bend downward, and the whole vine hang in the form of a bow. This counteracts the tendency of the upper buds to get the advantage of the lower ones. When all have taken an equal start, which can be secured by altering the curvature of the vine, and the shoots have grown 2 or 3 inches long, the vine may be put in place. Fork over the inside borders and syringe the house thoroughly. If any injury has happened to the vines in winter, which will be indicated by cracking and bleeding, and a failure of the upper buds to start, the vine must be cut back, and a strong lower shoot selected to be trained in place of the vine cut away. Keep the temperature of the house at about 65° until near the end of the month, when it may increase to 70° or 80°, and the syringe be used to wet all parts of the house and vines, morning and evening. Avoid sudden changes of temperature within the house.

Apiary in April.

The full notes by Mr. Quinby, given last month, are in good measure applicable to this, especially, if on account of the weather, or for other reason, or no reason, the suggestions were neglected. Mr. Q.'s memoranda for April have not come to hand.

—Be sure that each hive contains a laying queen, and food (honey) enough to last them until flowers are abundant. If all the stocks are strong and well provided, there will be little danger of robbing. The bees will be busy gathering pollen and nursing the young brood. But if severe frosts and rains cut off the supply of pollen, they will very likely begin to rob. At such times watch the hives and contract the entrances. Robber bees may be detected by their greasy look, and by the ferment of excitement the robber-colony is in. In the robbed colony there is great excitement also: bees leave with full honey sacks, and if flour be dusted upon them as they leave, they may be tracked to the hive in which they belong. It is sometimes advised to change two such hives, placing each on the other's stand. April is a favorable time to transfer bees to movable comb-hives. This is best done by driving the bees from their hive, inverted, into a box of about the same size placed above it, and when nearly all have gone up, set the bees at one side and open the old box hive by prying off one side, so as to expose the flat sides of the combs. Then cut the combs out one after another, and laying them upon a soft cushion of some kind; cut them to fit snugly, and tie them into several of the frames of a movable comb-hive. The combs may be tied into the frames by fastening splints on each side, or by winding strings or wire round and round, which are removed after the bees fasten the combs to the frames. Arrange the combs as nearly in the same relative position that they had originally as possible. Finally, shake the bees upon the top frame and put down the cover. Injury may happen to the brood if this be done in the open air; hence the hive should be removed to the workshop. Put new hives and old ones in order for use. All filth and refuse, dead bees, etc., must be carefully cleaned out, and the bottom boards kept clean. Salt sprinkled under the hives will keep away the ants, and the moth worms must be sought out and killed. Wrens, if their boxes are set near, or among the hives, will help keep moths in check. Study carefully the progeny of Italian queens; see which have the brightest colors, and which queen is best to select as the mother of new queens for "Italianizing" your stock, or for improving the breed, if it is already Italianized. There is a great difference in queens, and the stock which contains the best one should lack nothing—neither bees nor honey, nor empty brood cells for her to lay in; and according to the needs of your apiary, she should be furnished with worker or with drone comb in which to lay. With proper care, the Italianizing of an apiary may proceed very rapidly.

Interesting Emigration Statistics for 1866.—During 10 months, from Jan. 1st to Oct. 31st, 1866, there arrived at the port of New York alone **209,723** Emigrants or New Settlers from different parts of the Old World—much the largest proportion of them from Germany, Ireland and England—as follows:

Jan. 10,861 | Mar. 14,204 | May 41,550 | July 29,322 | Sep. 15,482
Feb. 6,108 | Apr. 20,418 | June 34,183 | Aug. 17,438 | Oct. 19,597

The destination of these new comers is also interesting. Large numbers stop in New York City, and are set down to this State, though many of them afterwards move on westward and to New England. Why Indiana received a greater number than any other State is not clear to us. So far as ascertained, their destination was as follows:

New York.....	93,565	California.....	1,465	Mississippi.....	54
Indiana.....	22,893	Kentucky.....	1,430	New Brunswick.....	50
Pennsylvania.....	21,843	Virginia.....	897	Oregon.....	37
Illinois.....	19,995	Dist. Columbia.....	699	Nova Scotia.....	35
Ohio.....	11,147	Tennessee.....	496	Colorado.....	30

Gold has declined since our last from 140½ to 133, leading to corresponding depression in most financial and commercial values. Within the past few days it has been more freely dealt in by speculative buyers at rising prices, thus stimulating business in other departments. . . . The month under review, (February 16 to March 15,) opened with a dull and heavy market for nearly all kinds of Breadstuffs. Liberal receipts of Flour and Wheat from California influenced prices unfavorably, making holders eager to sell and buyers reluctant to purchase more than was necessary to supply pressing wants. Subsequently the demand improved, fostered, in part, by more encouraging foreign news, which led to rather extensive export operations, especially in Corn. Prices rallied pretty sharply, and toward the close the tendency was upward. The principal receivers evince less disposition to press supplies on the market, and less anxiety to realize at the ruling figures, as they generally look for the establishment of even better rates, in view of the current light arrivals and the gradual absorption of the stocks available at this center. . . . Provisions have been much brisker, and hog products firmer in price. Beef has been steady. Butter, Cheese and Eggs have favored buyers decidedly. . . . Cotton has been more freely offered and more sought after at reduced quotations, closing with partially renewed firmness. . . . Wool has advanced 2c. 25c. ½ lb since the passage of the Wool Tariff, so-called, but at the improved prices trade has been very moderate. . . . Hay has been scarce and stiffly held, with a fair inquiry, partly for ex-

port ...Hops, Seeds and Tobacco have been comparatively quiet at about previous figures.

CURRENT WHOLESALE PRICES.

The heavy snow storms reduced the supply of animals materially, the last half of February.... **Beef Cattle** run more than a thousand head below last year's weekly average. Prices went up correspondingly, the best reaching fully 18c. \$ lb, estimated dressed weight, the last week in February, but fell back 1c. @ 1 1/2c. \$ lb, (March 5th,) and continue about the same this week—viz: 16 1/2c. @ 17c. for first quality cattle, and 17 1/2c. for a few extras; medium good qualities 16c., fair to inferior 15 1/2c. @ 14 1/2c.; low grades, 12c. @ 14c.... **Milk Cows** are in very little demand here. A really good milker with her young calf by her side, and sure of being sold for no defect, will bring \$80 @ \$90, calf included, where a purchaser happens to come along, and an occasional fancy animal goes at \$100 and upwards; but the most of the sales are at \$75 @ \$70 for fair animals, and \$60 @ \$50 for inferior to lowest grade.... **Veal Calves** have been selling well, 13c. @ 14c. \$ lb live weight for the best grades, but the seizure by the Sanitary Police of some 500 carcasses of dressed young calves has turned the appetites of most persons against veal, and 12c. @ 13c. are the highest present rates, with plenty of sales at 10c. @ 11c. for common, and 9c. and below for poor. It will be useless hereafter to send a calf here under four or five weeks old at least.... **Sheep**—The new tariff on wool is leading farmers to keep their sheep, to get the spring clip of wool, and our markets are scantily supplied. Prices have rapidly advanced to 9 1/2c. @ 10c. \$ lb live weight for good sheep; 10 1/2c. @ 10 1/4c. for extras, and 9c. @ 7 1/2c. for inferior to poorest.... **Live Hogs** advanced materially two or three weeks ago, but with warmer weather approaching, with the Lent season present, and with fair supplies, the market is declining. The latest sales stand at 7 1/2c. @ 8 1/4c. \$ lb live weight, for the different grades.

Hop Culture.—There is increasing interest taken in this crop, which is frequently so profitable. We cannot better satisfy our readers than by referring them to our little manual of hop culture, for which see book list. The authors of the prize essays will be able to give information as to how and where sets may be obtained.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

SPECIAL TO ADVERTISERS.

Owing to the greatly increased circulation of the *American Agriculturist*, it is necessary to send the paper to press much earlier than formerly, in order to have the numbers reach all subscribers by the first of the month. For this reason, to insure the insertion of an advertisement, send it in by the first of the month preceding publication, and never later than the 10th. Advertisers will please make a note of this, to prevent future disappointment.

No Plants for Sale. No Seeds for Sale.

No Cuttings for Sale.—We wish we had a thousand acres with hundreds of people with nothing to do but make cuttings, save seeds, and do all sorts of kind things. But the trouble is we haven't, and if we were to supply all the grafts of the Bourré Clairgean pear that have been asked for, our one tree would only serve as a bean-pole. So with seeds; we notice a plant, and hundreds of people think we have seeds to sell or give away. We are not in the nursery or seed business, but have only private grounds for our own amusement and instruction. The dealers advertise, and each nurseryman or seedsman is supposed to have a general assortment. Will our friends just see how impossible it is to answer their many requests for plants, cuttings, seeds, and the like?

American Pomology.—Part 1. Apples.

by Dr. J. A. Warder.—To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work that will cover the whole ground. The author has taken the "bull by the horns," and attempted to bring apples into something like order. We leave criticism of the work to other bands, and content ourselves with giving an idea of its contents. This volume has over 750 pages, the first 373 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like. The remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, gives evidence of a fearful amount of labor. This differs from any fruit book heretofore published in this country, in presenting a classification of apples. The author gives principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. Should this stand the test of experience it will prove a great advance in pomology, and we trust it will be given a trial. Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will prove equally useful to the novice and the experienced orchardist. The work has 293 illustrations, and is printed on good paper, well bound, and sent by mail at \$3. Ready on April 1st, or shortly after.

S. S. Question-Books—Advance in Price.

—The manufacturers find it necessary, in order to cover cost, to increase the price of "Lessons for Every Sunday in the Year" to 15 cents per copy. They are still the cheapest books in the market, however. The postage is 4 cents per copy, or 3 cents each in parcels of ten or more. We send full sample copies, (Nos. 1, 2, 3, and 4,) post-paid, for 75 cents.

A Horticultural "Gift Enter-

prise."—Several have sent us circulars of the "New England Vine Growers' Association," at South Norwalk, Conn., asking our opinion thereof. This circular, in brief, starts with the announcement that the object of the Association is—we can't use all their adjectives—the promotion of Grape Culture. It will receive "subscriptions" from everybody at \$3 each. (It wouldn't look well to say sell tickets.) For this \$3, one gets 1 Iona, 1 Delaware, and 1 Concord grape vine. The circular says: "This

being a discount from "Nursery prices," which simply is not true. Besides these vines, a "subscriber" has a chance in the "award of premiums"—why not say lottery and be done with it? These are: First, "A farm of 40 acres, title perfect; second, 15 acres of land near a thriving New England village." We will not discuss the vagueness of these premiums as it is self evident. We have a letter from the secretary of this "Association" referring to very respectable people. We advise him to get out of a disreputable scheme, &c. he will not be able to refer to some of these again. That precious humbug, the "Orphans' Home Lottery," leaves its slimy train behind it, and though it was countenanced by wives of officers whose patriotism outweighed their discretion, it is now a common by-word of reproach. In behalf of horticulture we denounce this project, and beg every right-thinking man to withdraw his name from it. New England enterprise needs no such "stimulating" for any "inactive branch of husbandry." (See catalogues.) Better that Connecticut should never bear grapes, other than on her State shield, than that their culture should be forced by a lottery, and it is "only this and nothing more."

The Grape Culturist, by A. S. Fuller,

New and Revised Edition, N. Y., Orange Judd & Co., 1867.—When this work first appeared in 1864, and before the publishers of the *Agriculturist* had any interest in it, the following appeared in a notice on page 101, vol. XXIII: "This treatise covers the whole ground of garden and vineyard culture, from starting the plants from eyes or cuttings, to the established fruiting vine. The whole is told in a plain style from the author's own experience; his system of pruning is very simple and easily understood, and the reasons are given for preferring it to others; he, however, gives the other modes in practice and illustrates the whole in a most liberal manner. * * * This most useful manual will be equally valuable to one who cultivates a single vine and to the vinyardist." After three years, and having in the interval read all its successors, we cannot express its character better than to repeat and emphasize this commendation. Mr. Fuller, in his writings, as well as in his nursery, tells the "secrets," as some consider them, of horticulture so freely that some grape-growers blame him. This, however, only gives him the stronger hold on "the people," for whom he writes, as is seen by the large sale that attends every book that bears his name. The new edition is brought up to the present time by additions. Some parts have been entirely re-written and new illustrations added. It still continues to be the Grape Book. Price, \$1.50 by mail.

Humbug Plants, Seeds, Etc.—At

this season it is well to avoid all circulars and advertisements of wonderful corn, and other seeds and plants, brought before the public just at the planting season, too late to admit of an inquiry into their real merits. We see several such things advertised with got' up "certificates," and have rejected sundry such advertisements offered at prodigious pay. Don't waste money, time, soil, and labor on any of these before unheard of things.

SUNDRY HUMBUGS.—Hundreds of

letters this month show great activity among the "Ticket" and Circular operators. Many ask an immediate answer by letter, but we cannot respond individually to half of them. Many swindlers, previously shown up by us are still inquired about. We cannot repeat all we have written; those interested should look over our back numbers; several hundred operators have been described within a year. We give below the present names of several operators, but most of these names will soon be changed to others, if not already done. Three or four men, like Tuttle and Todd, have used quite a number of different names within two years past.... A huge swindle, with large plans and employing a great many clerks, was recently started at 62 Broadway, under the name of the "Bankers' and Merchants' Grand Presentation Entertainment," ostensibly by "Clark, Webster & Co.," but probably by a large Chicago operator, with J. D. Miller, the "Sand River Petroleum Prize Co." man. The police stepped in and seized an immense mass of circulars, etc., and nipped the swindling scheme, though about 20,000 circulars had already gone out. All of these Gift Enterprises, etc., are to be carefully avoided, no matter how pretentious or plausible, or how good an object they may profess to be aiming at.... We continue to receive circulars issued by "Harris Brothers," of Boston, offering a copy of the *American Agriculturist* to subscribers to the so-called "National Distribution," alias lottery, for a home for disabled soldiers.... In October last we exposed this swindling concern. The managers have been put under "bonds" in the Boston Courts. As before stated, we recognize no certificate issued by them.... A vile villain, calling himself "A. B. Canning, M. D.," sends circulars to young men, and even to lads as young as 13 years, offering disgusting books, instruments, etc. He refuses to deliver these things in person, and can only be

reached by mail. Of course any such man would pocket any money sent him. If to be found, he should be summarily locked up. It is now positively unsafe for parents or guardians to allow any mail matter to go into the hands of young people without being previously examined.... A letter from South Carolina says the writer sent \$10 to Whitman & Co., N. Y., for a lottery ticket, but can get no response—says further he has not the means to take the *Agriculturist*. If he had invested \$1.50 of the \$10, in this journal, its warnings would have saved him \$8.50 sent to the hogus lottery man.... *Hazard & Moore*, 120 Broadway, are grand fellows to furnish watches; they offer 434 watches valued at \$100 to \$450 each, and a lot more at from \$20 to \$275 each, all for \$12 each, to persons green enough to bite at their bait. We pity those who are foolish enough to believe that these fellows will, for \$12, furnish watches worth any such money as they would make people believe. A halfdozen of their tickets have been sent to us by subscribers—all calling for \$43 to \$47 watches on paying only \$12. Could they not let us have one of those \$300, or \$325, or \$450 tickets offered at the same price? We hope our readers are too well informed to *hazard* any *moore* money with that properly named concern.... *Garland & Co.*, (Todd,) 119 Broadway, right opposite the above, appropriate, *on paper*, the whole *outside* of a splendid building. They have, inside, one room better fitted up than the rickety attics usually occupied by the "grand establishments" of the gift men. Moreover, "Garland & Co." strike for smaller fish than Hazard & Moore, and ask only \$5 each for their \$35, \$45, \$60 and \$65 watches, their \$20 to \$45 pistols, music boxes, vest chains, etc. We have tickets of their's enough to get rich in an hour ("over the left"). Why, right here is one lot as a sample: 16 tickets calling for \$558 valuation in watches, etc., all new articles, to be given us on paying \$5 each, and \$1 more for each ticket—only \$96 in all, or nearly *six dollars* for one!!! Good place this New York is: benevolent fellows just do a large *losing* business to make other people happy—\$558 "valuation" all for \$96!! We must call at 119 and 120 Broadway and get rich; \$6 for \$1 will pay vastly better than publishing the *Agriculturist*. (When it *does*, we'll surely let our readers know, for these fellows have an unlimited supply, and we want *our* readers to all the good chances.).... *Marcus Grandin* (grand humbug) locates his P. O. at Danville, N. J., and tries to imitate city swindlers. Having less rent to pay than on Broadway, he offers \$110 watches for \$5, and asks only 25 cents for tickets. We have lots of the fellow's tickets: 100 of these promise us \$11,000 worth of gold watches for only \$525.!! Our head is turned with the *prospective* wealth! When we get any of it we will tell our readers; when they get anything but loss from Marcus Tullius, Cicero, Grandin, or any others of these ticket chaps, will they please tell us?... *Similar to the above* are the following: Mackay, Puff & Co., 81 Nassau street, N. Y., *alias* 333 Walnut street, Philadelphia.—Carey, Bonner & Co., 612 Chestnut street, Philadelphia, *alias* 335 Broadway, N. Y., *alias* 48 Exchange Building, Boston.—Vincent, Willis & Co., and J. Birch & Co., Williamsburg, N. Y.—Richard Ayres & Co., 81 Nassau street, N. Y.—J. Hickling & Co., 149 Broadway, N. Y.—Jas. Prendegast & Co., 33 John street, N. Y.—JASON H. TUTTLE, Bevans, N. J., *alias* Flatbrookville, N. J., *alias* New York City, *alias* a good many other places, *alias* the express parcel swindler, *alias* Reeves & Co., *alias* other names, *alias* the man who put "U. S. Sanitary Commission" on his different named envelopes, and was stopped by the agent of the U. S. Sanitary Commission, (see N. Y. City Police Reports,) *alias* one of the most extensive, various, and barefaced villians out of jail, unless we except L. Todd.... The half dozen "*Doctors*" inquired about in many letters before us, are, every one of them, either quacks or impostors, and by no means to be trusted with your money or health.... The so-called "*Howard Association*," of Philadelphia, is a myth, we repeat again, as persons keep asking about it.... Don't trust your precious eyes to one of these advertising men who offer to cure by prescription or by instruments. If you must *give* them your money, don't use their apparatus or medicine.... Beware of the *Ink and Washing Compounds* offered to "agents" and others.... The low-priced sewing-machines, of half a dozen kinds, offered with great display of claims and recommendations, are not worth buying. A pretended "Company" in this city sends out worthless machines at \$15 each. We hear of cases where poor soldiers' widows have been thus swindled out of money borrowed to help them to a machine to earn their living. The "Medallion and Franklin" machine, of Boston, we know nothing about. A Pennsylvania subscriber complains that in order to get their improvements, he is required to buy a *new* machine—says the old one drops a stitch so often that it is worthless.... Hundreds of *Recipes* for effective, but dangerous to clothes, washing compounds, for coffee extracts, for making honey, etc., etc. We would on no account invest a dime in any one of those sent to us. The same of recipes for making cheap oils, etc.... The "Royal Havana Lottery" was fully exposed last May, page 172.

...Cosmopolitan Art Association, for relief of soldiers, etc., is a humbug.... "Manufacturers' Association," 197 Broadway, N. Y., offering \$30,000 prizes for \$6, is a humbug.... But space fails us to go through the long catalogue of humbugs, vile publications, medicines, and instruments, etc., etc., now before us. No response given here, or by letter, in reference to any particular scheme, sent to us, implies that it is also a humbug.

Personal.—An Indiana correspondent asks: "What has become of A. S. Fuller, has he quit the nursery business? I have not seen his card in the *Agriculturist* for some months."—When we last saw Mr. Fuller he went out of the door of 41 Park Row, with a basket on his arm, contents unknown. We presume he went directly to his present residence in Ridgewood, N. J. He says he does not dare to advertise in the *Agriculturist*, as a single advertisement made a demand for all the stock he could raise last year. The same correspondent asks "Who is Timothy Bunker?" We thought every one knew he was Justice of the Peace at Hookertown, Conn. He is one of our valued contributors, and for all further particulars we must refer to Mrs. Sally Bunker, of Hookertown, who has enjoyed his acquaintance much longer than we have.

Horse Hay-Fork Trial.—A trial of horse-hay forks was held under the auspices of the Farmers' Club of the American Institute, on the farm of Josiah Maey, in the town of Rye. The trial continued two days. Sixteen forks were tested, each one having a weighed load of good hay to unload over the beam. Many did the work very handsomely, while some failed, but in our opinion more from bad management than from any inherent difficulty. Still there was a great difference in the forks. Of the "forks" presented there were but two real forks; five were Grappling Claws, and nine were harpoons, or of similar construction. There was far too great a difference in the weight of the loads and in the manner in which they were loaded; and it was currently reported and believed that while some of the exhibitors took the loads furnished them without a question, others had been sharp enough to be present early and load their own hay. The bare fact that the loads varied in weight from 544 lbs. to 2,180 lbs., as reported, shows that there was no accuracy attempted. Blodgett's Cat's-Claw Harpoon was first tried, and did very good work, impressing us as favorably as any harpoon fork. 'Sprouts' Harpoon and Hay Knife was better manipulated, and showed off better than any of its class. Davidson's Harpoon and Knife was not worked so well, but is a good implement. The Ames Plow Co.'s Harpoon is of exceedingly simple construction, appeared very well, but was not well worked. That harpoons are better adapted to good long upland hay, timothy or orchard grass predominating, is evident; the grappling forks or claws are adapted, (if they have fingers enough,) to hay, straw, fine hay and even manure. They are heavier than the harpoons, but nearly as easily managed, and make cleaner work. We are satisfied that any effort to make them lighter by a reduction of the number of fingers below two on each side, and perhaps we should say three, is a damage to their efficiency. Raymond's Grappling Fork was attached to a "traveller," called the "Hiek's Car," and did excellently well. There were other grapples which appeared well, but which, for some cause did not work very well. Plumb's "Railway Hay Elevator and Carrier" is a simple traveller furnished with an immense wooden headed fork, with the handle set at right angles to the tines. It was a fixture of the barn, and though clumsy did good work. The old Palmer (revolving head) Fork, a true fork also, did its work very well. Before purchasing, a man must decide between the harpoons, taking big "grips" and the true forks, with their smaller grips. The Farmers' Club deserves the thanks of the public for affording this opportunity of seeing the hay pitchers all together, and manufacturers will be not the least benefited.

The following is the report of awards: "First award in Class No. 1 was given to 'Palmer's Excelsior Sickletined Fork,' entered by Palmer & Wackenhagen, Hudson, New York; second prize, Class No. 1, to John H. Champman, Utica, New York; Second Class, first prize, Harpoon Forks, to C. C. Blodgett, Watertown, Jefferson County, New York; second prize to S. C. & L. B. Sprout, Muncy, Pennsylvania."

Catalogues, Etc.—We have been furnished with a large number, but our list of acknowledgments has been crowded out by the press of matter.

Why It Pays?—Many have asked how can men afford to pay the rates charged for advertising in the *American Agriculturist*. First, we may answer, that this is the cheapest way to reach so many people. To merely print 160,000 large cards would cost at least \$5 per thousand, or \$800; to have the same card electrotyped, fastened into the page as an advertisement, neatly printed

and distributed into 160,000 families, one in a place, costs one-fifth to one-tenth less than the bare printing of the cards. The paper is seen by many others than the subscribers. Probably seldom less than 250,000 different families read the *Agriculturist* regularly. It would seem to be impossible that any man engaged in respectable business should not find among all these readers enough patrons who also desire to find him, to make his business well pay the cost of an advertisement and a fair profit. Again: aside from the immense circulation of itself, making this the cheapest medium in the country, people have confidence in the parties whose cards are admitted into these columns and patronize them. Our rule is to admit none who are not believed to be entirely reliable, so that our readers may safely send their orders, if wanting the goods offered, and at the prices asked. There is also a great advantage in having the matter clearly printed, and *permanently* placed in the hands of subscribers, as most of them preserve the numbers to bind up, and the advertisements are printed in every edition issued. These considerations are fully appreciated by advertisers, as our crowded columns bear witness (while several pages have been left out for want of room,) and we are happy to know that "I saw your advertisement in the *American Agriculturist*," is becoming a stereotyped phrase in many business establishments, from its frequent occurrence in letters received from all over the country.

Prize Essays on Housekeeping.—Several competitors for the \$100 prize have desired the return of their manuscripts, upon the supposition that we had no further use for them. It is proposed to issue a volume on housekeeping, made up in part of selections from these essays. As soon as the editor, who has this matter in charge, finds time to make the selection, the remaining manuscript will be returned to their authors, in all cases where they are desired. If any object to this use of their essays, we shall return them immediately.

Scalding Peas to Kill the Bug.—This practice is good, but caution is advisable. Peas will stand boiling hot water, *provided* not more than a few quarts are scalded at a time and the amount of water is just about sufficient to cover them. A subscriber reports pouring boiling water over about *two bushels* of peas, and attributes the partial failure of the crop to this.—He is no doubt right. So much hot water retained, heat enough to both kill the bugs, and *cook* the peas.

Works in Preparation.—We shall shortly publish a translation of Dr. Friederich Mohr's Work on the Grape, the German title of which is "*Der Weinstock und der Wein*." That portion treating of the vine will only be issued at present. "*Horticulture*," in a notice of the original, in the *Gardeners' Monthly* says: "His work does not interfere with any extant." It is a setting forth of general principles upon the understanding or neglect of which the success or failure of all culture and training depend. We shall also shortly publish a manual of Squash Culture, by the authority in such matters—James J. H. Gregory, of Marblehead, Mass.

How it Sells!—Gardening for Profit has had a remarkable run. Every land owner, whether of one lot or a farm, should have it. \$1.50 by mail.

The American Naturalist.—The first number is out. We welcome it as a long needed helper.

Wet Cellars.—Harrison County, Ind. We have several appeals from the West—among others three from the above-named county, for information in regard to water-tight cellars. The land, we presume, is flat and heavy, or holds water like a sponge, so wherever there is a hole it is of course filled. Well, the cure is very simply stated. No one has any trouble in firm soil to make a tight cistern. All our friends have to do is to make big square cisterns and put their houses over them. Round cisterns will bear great pressure from the outside: large square ones will not, unless securely walled. Besides, if the floors are very large, and water has access under them, the pressure might lift the floors of the cellars in spots. This is obviated by flagging with flat stones or laying a course of bricks or of planks upon the front layer of cement. Partition walls of stone or brick will not only secure both the outer or foundation walls and the floor, but add greatly to the coolness of the cellar. These walls should be carried up at the same time that the foundation walls are laid and bedded, but carried up in cement. One-third good hydraulic lime (or cement) and two-thirds sharp, clean sand, make a good cement mortar.

Horse Racing at Fairs.—Last autumn, great exertions were made to give a good start to an Agricultural Society in Minnesota. Nothing but want

of space prevented our responding to the request to lend it our strong aid. Of the Fair held, a lady friend writes incidentally: "I was sorry you could not visit us last fall, though I suspect you would not have been pleased with the fair. The display was said to be very creditable to our young State, but like Tim Bunker's State Fair, the prize money was mostly paid to horse racers; and the housewives, to whose handiwork premiums were awarded, are obliged to content themselves with paper diplomas instead of the promised premiums. I think the effect will not be favorable to future fairs. Many say; 'the horse jockeys take all the prizes; I will not try again.'—Last year I made 300 lbs. of premium butter from one cow, and husband proposed taking 'Cherry,' her calf, and a crock of the butter over to the fair. He was too busy, however, and would have lost his labor." The people were too much occupied with the fast horses to pay any attention to such trivial matters as 300 lbs. of good butter from one cow, besides the family supply of milk.

The Monthly Report of the Agricultural Department for January contains several interesting and valuable articles. One on the "Rate of Wages of Farm Laborers in the United States" has been prepared with great labor and pains. There is also an important article on wool consumption, and one on the Red Bug or Cotton Stainer, besides minor items, tables, etc. Now, why should not the people who are taxed for this publication, and are sufficiently desirous to get it, write for it and be supplied?—They will be informed that the supply is exhausted. We claim that subscriptions should be taken at cost for this and similar publications, and so all who wished could be supplied, provided they applied in advance; 5 cents a number or 50 cents a year would more than cover the cost of printing, etc.

Prescribing at a Distance.—The London *Lancet* records a case of an Englishman, in this country, who, being seized with a renewed attack of an illness from which he had suffered at home, consulted his physician in London, by means of the Atlantic cable, a prescription was returned by the same channel. This is as in the olden times, when physicians wrote in cabalistics.

Peat as Fuel.—A word of caution is necessary to the enthusiastic people who are rushing into peat enterprises, buying peat machines and peat bogs at fabulous prices. Remember Multiculis and Petroleum. There is undoubtedly great wealth in our peat swamps. It is a question to be solved, whether they are worth more for manure, or for fuel. In estimating the value for fuel, it will not do to put a cord of uncondensed peat higher in value than a cord of wood. Then it is to be remembered that peat in drying shrinks into from $\frac{1}{3}$ to $\frac{1}{2}$ of its original bulk, and the better the article the more shrinkage. If it costs three dollars a cord to manufacture peat and two dollars to get it to market, and wood is worth only four dollars a cord, you do not gain much by buying peat, or putting it into the market. This whole business is too much a matter of experiment for farmers to venture upon largely. It will be safer for capitalists to make the experiments. While the article is so valuable for manure, we should not advise haste in selling peat hogs, even at the high figures sometimes reported.

Grapes—A Correction.—In our catalogue of Grapes, in the Horticultural Annual, Roger's Hybrids were omitted by the loss of a slip containing the notes. This omission occurs only in the first two thousand, and is remedied in those printed since. That which Doet. Grant proposed to call "Washington," and is so recorded in the Annual, is to be known as *Eumelan*.

The Miner Plum.—This variety is advertised as of "excellent flavor," and "never injured by the euroilios." Can some one—not interested in its sale—give us an account of this plum, and its real value?

Keeping Pickles in Salt.—M. Roberts. A quart of salt to a gallon of water will make a brine strong enough. There is no danger of getting them too salt, as they will only absorb about so much, and the soaking before putting into vinegar will take it all out. The greening of pickles by putting them in a brass kettle is a custom much more honored in the breach than in the observance. Pickles are made for the stomach rather than the eye, and should not be poisonous, that they may be green.

Salt in Whitewash.—Salt is a good addition to whitewash, but if put into that used upon fences or buildings which cattle can get at they will be likely to lick it off. Wash made of water lime is less glaring.

Sorghum Vinegar.—"J. W. Y." says a good vinegar can be made from sorghum juice without evaporating, by letting it stand in the sun a few days, exposed as much as possible to the air. With the syrup

at a dollar a gallon it is not a very cheap source of vinegar. The skimmings are much cheaper as recommended in Feb. number, page 48. Why would not the bagasse, or pressed cane, treated in a leach like the apple pomace, make a good vinegar? Has this ever been tried?

Hoe Cake.—Hawkey gives the following: Mix a little salt with sifted meal, and pour boiling water upon it, sufficient to dip the batter out on a common cooking stove griddle. This should be tested by throwing a pinch of meal on it, and it is hot enough when the meal begins to turn brown. As soon as this is the case, dip the batter or mush out of the pan upon the griddle until it is covered all over exactly half an inch thick. Cook it with a lively fire, and when haked enough to turn without sticking, turn the cake over and bake it on the other side.

Nice—How to get rid of them.—"C. T. P." Keep a good cat. Color not important. Set the common wire spring traps. Use any of the rat poisons made of phosphoric paste. Use arsenic spread on a paper, and mixed with meal—where nothing else can get it.

Ventilation in Houses.—Mrs. C. C. Allen. See March No. *Agriculturist*, 1867, and Sept No., 1864.

Maryland Recipe for Hams.—For one hundred pounds of hams, eight pounds of fine salt, two pounds of brown sugar, two ounces of saltpetre, $\frac{1}{2}$ ounces of potash, four gallons of soft water. The brine must be boiled and cooled. The meat must be well washed before being cut up, then lie in a cool place for some days. Rub each piece with fine salt, and pack the whole down. Let it remain two or three days, according to the weather. The brine should then be poured into the eask at the sides. Leave the hams six weeks in the brine. Take out and rinse in cold water. Hang up to dry four or five days, then smoke with hickory wood.

Cornmeal Pudding.—Mrs. L. A. Muller. —Two cups of cornmeal, one cup of grated bread, one cup of molasses, and one of sour milk, two tablespoonfuls of butter, a half a teaspoonful of ginger, do. of cinnamon, one teaspoonful of baking soda, or a half a teaspoonful of saleratus, three eggs; after the batter is made, one cup of sliced apple—the apple must be of a kind that will cook quickly—and can be added or left out as preferred. Bake half an hour in a moderately hot oven. Cream and sugar for sauce, as any other is apt to alter the flavor.

Corn Muffins.—One and a half pint of cornmeal, a half pint of wheat flour, one pint of sour or thick milk, two pints of sweet milk, two eggs, a small teaspoonful of salt, do. of baking soda. Bake twenty minutes in a tolerably hot oven. To be made up just before baking, and must be well heated. If preferred, use all sweet milk, and raise with a tablespoonful of yeast.

Newport Cake.—Three eggs, 1 quart of flour, 2 teaspoonfuls of cream tartar, 1 of soda, 2 tablespoonfuls melted butter, 3 of sugar, 1 cup of milk. Bake in a long tin pan and cut in slices; eaten hot with butter.

Corn Biscuit.—One and a half pint of cold mush, one and a half pint of wheat flour, one cup of butter, nearly a pint of sour cream, a small teaspoonful of baking soda, do. of salt. First rub flour and butter together, then add mush, then the other ingredients.

Rye Bread.—"C. H." wants a recipe. "A quart of water and as much milk. Two teaspoonfuls of salt and a teaspoon of Indian meal. A teaspoonful of home brewed yeast, or half as much distillery yeast. Make it as stiff as wheat bread with rye flour.—Miss Beecher.

To Keep Smoked Meat.—By J. C. E.—Make a dark, tight closet in the north end of the garret, or in any out-building. If there is any appearance of fly or worm, during the summer, dust the hams with air slaked lime. Some allow their hams to hang in the smoke-house during the summer, starting a smoke occasionally to keep off insects. The house should be tight.

Cooking Cabbage.—H. B. Stanley.—Cut it fine, but not cross cut it. Put it in the frying pan, add a little salt and pepper, with some cream and a large piece of butter. Cook it slowly for ten minutes. Then add a half teaspoonful of vinegar, and turn it over immediately into the dish from which it is to be served.

Influence of the Moon on Meat.—"I. P. C. S." It is one of the many foolish superstitions that the world has not yet outgrown. "Kill your pork when the moon is increasing and it will swell in the pot." Stuff your pigs with good sound corn, or corn meal, for two months before slaughter, and the moon can't help its swelling in the pot. The meat of lean, half fed animals always shrinks in cooking.

Poor Man's Pudding.—Set 2 quart skim milk over a kettle of hot water, until it is scalding hot, then stir into it a pint of corn meal, and immediately after set the pan off; add a teaspoon of syrup or molasses, a teaspoonful of salt, and one of allspice; put in a buttered pan; bake slow one hour. Good, warm or cold, with cold cream or without.—M. W. C.

Pumpkin Johnny Cake.—Take 1 bowl of corn meal, $\frac{1}{2}$ teaspoon of stewed pumpkin; add 3 tablespoonfuls of sugar, 1 teaspoonful of soda, and 2 eggs. Mix well and bake in a moderate oven.—Mrs. M. E. R.—[We have pleasant memories of this. Hubbard or Boston Marrow Squash is an improvement on the pumpkin.—Ed.]

Frothy Cream and no Butter.—"J. E." of East Fairfield, Ohio, says: "Our cow calved about the middle of Fourth month last; will calve again 27th of Fifth month; gave in the summer forty pounds of milk per day. We have failed to get butter for the past two months; nice thick cream, slightly sour and sufficiently warm, gets thin and froths in a few minutes and bids defiance to 'patience and perseverance.' We have tried all the remedies we have heard of, both for cow and cream. Salted the cow, etc., all to no purpose. We understand that it has been a failing with the cow heretofore. We could get good butter in 15 to 20 or 45 minutes during the summer and fall and early winter." Has not your cream frozen occasionally? Buy a thermometer and begin churning when the temperature of the cream is 65°, having scalded out the churn so that it will not cool the cream. Feed the cow a little linseed or cotton seed cake meal and some roots if you can. It will not do to warm cream by pouring much hot water into it.

Eggs for Setting.—"C. E. G." Buffalo, N. Y. Eggs will often hatch after being transported hundreds of miles by rail, at other times a few miles of wagon or railroad travel will ruin them. No reliance can be placed on eggs transported far, unless they be carried in the hands, and packed with great care at that.

What are Corn Cobs Good For?—"L. F. L." of Torrington, Conn., asks: "Are corn cobs of any use as nourishment for animals, or as a manure for vegetables? I sell a large amount of corn and have tried cobs as manure in various ways, have put them in my pig-pen for a season, and from there to my garden, have put them in a heap to heat and rot, and then to the garden, and have applied them in a natural state with bad rather than good results. I have used them as fuel, they make very strong ashes and will form a hard crust over the ashes in the stove, some of it is white, some green, etc., of which I send you a sample for your opinion; if it is fit for feed for stock of any kind, then our farmers should grind their cobs with their corn."—Ans. We suppose they have a little value as manure but are slow to decompose, and believe it to be much better to burn them and apply the ashes which are very valuable. It is worse than useless to grind cobs with the corn unless the corn is very soft and immature. After the corn ripens well the cobs contain a very small proportion of nutriment—not so much as straw.

The N. Y. State Agr'l Society held its Annual Meeting at Albany, on the 13th and 14th of February, for the election of officers, as announced in our last issue. The report of the Treasurer, Luther H. Tucker, Esq., showed the finances of the Society in a healthy condition. There was an interesting and instructive Address by X. A. Willard, on the Agriculture of Great Britain, and another by Dr. Fitch, on the recent discoveries in Entomology, dwelling particularly upon the canker worm, the joint worm, and the grape-beetle. The address of the retiring President, J. Stanton Gould, was a scholarly performance, full of practical wisdom which we hope to see carried out in the future operations of the Society. We exceedingly regretted that there were not better arrangements made for discussion of topics of practical interest to farmers and horticulturists. There were present at the meeting a hundred or more gentlemen from various parts of the State, and some from abroad, distinguished farmers, nurserymen, and horticulturists, whose last year's experience we very much wanted to obtain. Yet there were no arrangements made for discussions and experience meetings. We had but three sessions in the two days, when we could easily have had twice as many of two hours each, and have got much useful information and spread it before our readers. We beg leave to suggest a change in this respect at the next Annual Meeting. We know the Committees are necessarily busy, but the rest of the members should have work laid out for them in meetings for discussion.

Patent Office Reports.—"W." asks where he can obtain them. If "W." lives in a large city he can probably find them at any dealers in waste paper.

Slow Torture at the Stack.—An intelligent "Iowa Farmer" takes "Connecticut" to task for his plea for shelter for cattle. We agree with Connecticut in regard to the desirableness of shelter, yet believe with Iowa that such stock as we get from Iowa and Illinois do not appear to have led lives of extreme suffering. He writes: "Now I do not uphold slow torture or any kind of torture for the dumb brutes, but it does not follow because they are not in warm stables that they are uncomfortable. That depends very much upon climate, natural shelter and food. In the report of the live stock market of New York for the week ending Feb. 2—and I believe it is so during the year—nearly one half of the cattle were from Illinois, numbering 2,052, while only 97 were from Connecticut. I do not suppose one half of these Illinois steers were ever inside a stable, and yet when they left the Sucker State they were fine, fat, sleek fellows, and did not look as though they were suffering slow torture, but enjoying themselves about as well as bovines usually do. A fat animal rarely suffers from cold. But few of the men that have fed these steers are at present in much danger of going to the poor house."

Draining Marshes into Wells.—"M. M." This is sometimes done with success. If the swamp lies upon a clay hard pan, impervious to water, and there is a stratum of dry gravel beneath, it would be best to dig through the hard pan and watch the results. If the water disappears in the immediate vicinity of the well, it will pay to dig others. We should not rely upon one well to drain several acres. You want to empty your basin rapidly after showers, especially in summer. Wells at frequent intervals would also help to improve the character of the subsoil more rapidly. But if the wells fail, break through the hills and put down a covered drain deep enough to take off all the water. Marsh land is, as a general thing, poor property;—knock the bottom out of it, and it makes the best grass land in the world.

Selling Land for Quarries.—Mrs. N. E. B. An undeveloped quarry cannot be worth very much more than the value of the land for other purposes. It costs large sums of money to test the value of the slate, granite or marble, as the case may be; and all this investment is a dead loss if the stone prove worthless. Even when the value is proved, nearly the whole cost of a stone is for the labor expended in dressing it, and in getting it to market. And yet a stone quarry may be worth more to a community than a gold mine. It may make a steady market for labor and foster industrious habits.

Flat or Lap Furrows—Double Plows.—In our discussion of Flat and Lap Furrows we have had no reference to the furrows turned by double plows—that is, large plows, with a "skimmer" plow or "jointer" on the beam. "Brutus," of Westport, N. Y., writes thus: "In the number for January I see an article in which the writer gives the flat furrow the preference. Such is not the theory or practice of our first-class farmers in this section; the lap furrow better drains the land and gives us a warmer, livelier and quicker seed bed. That the grass and weeds are more troublesome with lap than with flat furrows may be true if sod-land be plowed with the common plow. But we obviate that difficulty in this manner: we attach to the beam of the plow, in the same manner as a coultter, what is termed a 'jointer,' which cuts two or three inches deep; as the plow moves on, the jointer deposits in the bottom of the furrow all the grass, which otherwise would form the joint or lap of the furrow, and thus it is buried out of the way of the harrow, and where it will rot quickly. Corn land prepared in this manner will require but little hand labor. Instead of a sod in the lap of the furrow, we have a ridge of mellow soil, and the cultivator or horse-hoe, in the hands of a careful laborer, will destroy all the weeds that make their appearance between the rows. In preparing stubble land for wheat the same plow is used; the jointer turns down the stubble, the plow covers it up, and the field has the appearance of a summer fallow. The jointer may be attached to any plow with a proper length of beam."—We hope this will beguile no one into employing lap furrows (in the common sense) in spring plowing, unless he can not make flat ones.

The Wheat Failure.—"J. B.," Richmond, Ind., writes: "The partial failure of the wheat crop during the past few years in some sections, suggests the question if with a soil of unsurpassed fertility, all the modern appliances of machinery, and various periodicals and books that treat of systematic and scientific agriculture, are we falling far behind our less favored neighbors of the extreme North and Northwest in the production and quality not only of wheat, but of other cereals? We admit the seasons have been of late unfavorable, but is this the only cause of failure? Have not other causes over which we had control had more to do with it? Have we not been too careless about the improvement and

selection of seed, the choice and preparation of soil? Have not successive and exhaustive cropping of the land, with a want of intelligent and searching investigation into this sad deterioration and diminution of one of our great staple crops, contributed to the result?—While some of our farmers have been allured by the specious representations and promises of adventurers and irresponsible dealers in "wine plants," tobacco, etc., they have neglected the culture of those more substantial and permanent sources of wealth upon which rest the real happiness and prosperity of the country. During a recent visit to Canada I was informed that the farmers meet at stated periods in their several districts for the buying, selling and exchange of choice grain, etc. Could not such a wise system be instituted here? Cannot something be done before we risk another failure?"—[It would be hard to set a limit to what a good, active township or county farmers' club might accomplish in this way.—Ed.]

Pump for Well.—"E. A. P." The distance of the well from the house is not a matter of so much importance as the depth of the well. The suction pump will only raise water twenty-nine feet in a perpendicular height, and the pump must be very perfect to draw this whole distance. The deeper the well, the more force it will require at the pump handle. The lead encased block tin pipe is a good article. The nearest village plumber will tell you the cost of the article and of suitable pumps.

What to Do With Slaughter-House Bones.—It is a difficult thing to say what a farmer should do with bones and offal that he can collect at a slaughter-house. They may all be thrown into a heap with stable manure, to fill all the interstices and give compactness to the heaps. This, if watered a little to start fermentation, and covered with earth or muck, will heat, and many soft bones and all the gristle and flesh will become free from the hard bones, which may be thrown out when the heap is forked over. The softened bones should be thrown to one side and mashed with a sledge. Those that remain hard, though they would yield to repeated operations, may better be left to dry and then sent to a bone mill, if one can be easily reached. There should be one in every neighborhood. If this can not be done, which is usually the case, the bones may be broken up somewhat with a sledge, and either rotted again, or treated at once with sulphuric acid and water. First wet the bones, which should be on a hard clay floor, somewhat dishing, or in a half-hogshead tub, then pour upon and over the heaps gradually oil of vitriol, to the amount of half the weight of the bones, adding more water occasionally. There will be intense heat generated, and the mass should be shoveled over or stirred well frequently, more water added if it dries at all; and so, after a while, the hard bones will yield. It may be necessary to add more acid, and finally the mass may be dried off by mixing the mashed bones, or adding muck or dry soil.

Corn Blight.—"Will corn blight if planted three years in succession upon the same piece of ground?" Not if you put on plenty of manure. Corn is said to have been planted on some of the bottom lands of the Scioto Valley for 40 years in succession, without any evidence of blight. But rotation of crops is ordinarily the true policy.

The skimmings of Sorghum Juice are said to be good food for milch cows, and it will pay better to use it in this manner than for vinegar.

Coal Ashes.—"H. S. F.," Bellows Fall, Ct., asks, "whether coal ashes can be used in any way." The best use to be made of them is on roads and walks, either by themselves or with gravel. They soon pack very firm. They contain a slight amount of fertilizing material and may be used on stiff soils where sand would be beneficial.

Farming by Professional Men.—We have received a letter from a city lawyer asking information upon this topic, which will soon be answered by a gentleman of experience. It is entirely practicable for a business man in the city to live in the country, and derive a large part of the support of his family from the cultivation of the soil, or to quit the city altogether upon a very moderate income. Just how this can be done can not be told in a basket article.

Louisiana State Fair in May.—An Association proposes holding a State Agricultural Fair in Baton Rouge, La., during the week beginning Monday, May 6th. Mr. Clayton Everts, of Baton Rouge, is Corresponding Secretary and will give further information.

Apples for Wisconsin.—At the annual meeting of the Wisconsin Horticultural Society the following list of five varieties was adopted: Red Astrachan, Duchesse of Oldenburgh, Fameuse, Tallman Sweeting,

Golden Russet. For a second five: Fall Stripe, St. Lawrence, Perry Russet, Red Romanite, and Willow-twig.

How to Make Hens Lay.—It is well enough to start hens in laying by giving them stimulating food, but we do not believe in keeping it up after they begin to lay generally. Much meat fat will induce disease sooner or later. M. J. Skinner, of Northampton Co., Pa., says he takes a common milkpot full of thickened milk, adds a tablespoonful of Cayenne pepper, and a handful of wheat bran, stirs it up and feeds it to the chickens every morning, and since he has done so has greatly increased his supply of eggs. It is a good practice, and not so injurious as feeding much meat.

Stale Fish for Manure.—Mackerel and other kinds of salt fish, which are spoiled for food, may often be bought very cheap for manure. They are best mashed up with soil or muck, and used after laying a few weeks and being worked over once or twice. Use at least three parts muck to one of fish.

Cure for Cribbing Horses.—We published in the December number a suggestion from a Volunteer Officer in regard to a cure for cribbing being effected by separating the crowding front teeth. He attributed the habit or disease of cribbing or wind-sucking to the painful crowding of the teeth. Since making that statement we have received several letters confirming the view. One correspondent says: "I am satisfied from experience the view is correct." Our friends of the N. Y. College of Veterinary Surgeons, however, say it is entirely incorrect, and that they have seen horses' teeth filed out—that is, a thin file run up between all the front teeth on the upper jaw without producing the least effect.

Improved King Philip Corn.—"Hol don" Dutton Corn and other standard eastern varieties, may be obtained of all dealers in agricultural seeds.

Breaking Horses to Single Line.—"J. L.," Chester Co., Pa., says the best way to break a horse to the single line that he has found is, to put him before a hoe-harrow in working corn, and attach single and double lines. When the single line will not answer, use the others. Have the single line loose from the harrow and folded around the hand. You can make a good leader of almost any horse in this way in a short time.

Two Eggs a Day from One Hen.—"J. G. S.," Philadelphia. It may be that your observation is correct. There is nothing in the nature of things to render it impossible for a hen to lay two eggs in one day. Two yolks in one shell are common. The occurrence of one perfect egg inclosed in another, (there being room in the outer shell for the first egg, and for a yolk and white of ordinary size), is not very rare. Hens will sometimes lay a sound egg and a soft shelled one the same day; but whether or not there is any absolute proof that a hen has laid two good eggs in one day we do not know.

Black Spanish.—"Can the Ethiopian Change his Skin?"—J. H. Mahbitt, of South Bergen, N. J., states that he has a Black Spanish hen, about one half of whose feathers came white at the second moulting; at the third she was entirely white; at the fourth she still remained white; at the fifth, which was last fall, about one half of her plumage came black. The hen now looks as she did at the second moulting. He says: "I have taken no little interest in watching the changes in her plumage, and intend to keep her as a curiosity until she dies. I presume she will be black again this fall. It is a freak of nature, and one I think of rather rare occurrence. Having made Black Spanish a specialty for the past six years, I have only heard of a very few from true stock that have made this change in plumage, and think, unless they come in contact with some white fowls, they will not become more abundant than 'white crows.'"

Threshing Conveniently in Single Floored Barns.—John Larkin, of East Brandywine, Chester Co., Pa., furnishes us with the following plan he adopted to do his threshing last fall, by which he says he was enabled to perform the same in about half the time formerly required. He has an endless chain one-horse power and thresher, and instead of having them both on one floor, as is the custom with most farmers in that section, he put the thresher up on poles, or square pieces of timber that had been put across the front part of the barn, about eight feet above the floor for mowing wheat on. He placed a couple of planks cross-ways of these, and screw-bolted them down. The thresher was then placed on these, and after adjusting the strup, was fastened down the same as on the floor. Two or three temporary posts were put up from the floor beneath and nailed fast to the cross-pieces, a few loose boards laid down for a floor, etc.

The strap from the horse power was passed up between the cross-pieces, and one of them was left in front of the thresher to support a platform for the person tending the machine to stand on, and a light strip was attached to the brake and extended up to the platform, to start and stop the machine without going down. The space under the shaker was left open for the grain to fall through to the floor beneath. The great benefit of this arrangement is that you have no caving-up to do while threshing, and the straw is easily thrown off into the bays on each side and avoids throwing the unthreshed grain so far down, and then having to *pitch the straw up*.—This plan certainly has great advantages in a single floored barn, but if the horse power can be placed on the floor below, the merits of this arrangement will not be so striking.

Suggestions about Threshing Machines.—J. F. Dilworth, of Port Penn, Del., offers some suggestions to makers of threshing machines, which are worth their attention, for many large grain raisers doubtless find similar difficulty. He writes: "Since steam has been brought into use for threshing grain, we have power sufficient to do a great deal more work if we had the threshers. We have been using the Pitt, Guiger, and Westenhouse machines; two of them are made in New York, and one in Virginia. They are all deficient in ability to separate and clean. We are now using the Westenhouse machine, which is a very good one, with an eight-horse engine; but when we feed the cylinder (36 inches, and large enough,) to its full capacity, it wastes a great deal of grain, by carrying it over with the straw—more with oats than wheat. The fan also is defective, not being near large enough; we want a fan capable of threshing and cleaning from the chaff sixty or seventy bushels of wheat, and one hundred to one hundred and twenty of oats per hour. The cylinder of the Westenhouse machine is able to do that amount of threshing with the power we use, and the consequence is the separating and cleaning capacity of the machine is over-taxed, and grain is wasted. Now, the separating might be done either by lengthening the straw carrier, (making two might be preferable, as it would give more strength,) or putting revolving prongs between the elevator and straw carrier, so arranged that they would not catch the straw, yet shake all the grain out. The fan would have to be made larger; in other words, we want a more elaborate machine; a little additional weight would be no objection; it would be on trucks, and there would be no trouble in moving it about. Last summer I had to carry my grain fan to the yard, and take the grain from the thresher, and put it through it before sending to market; this trouble might all be avoided by having an additional fan attached; it need not be large, and could be arranged on top of the machine, with elevators to carry the grain from where it is deposited by the first cleaning to the fan above, the tailings from that conducted to the cylinder, and the grain run into bags ready for market."

Economy of Feeding Turnips.—C. E. T., of Topsfield, Mass., writes as follows:—"Owing to the scarcity and high price of English hay, I have kept my few sheep this winter on low meadow hay, mostly 'buckhorn,' with about one quart of sliced turnips to each per day. They like this fare extremely well, are in good order, and the lambs so far (Feb. 18) are strong and active. I also give to my oxen, and other stock, which consume coarse hay, and to cows not in milk, a few turnips daily, much to their gratification and apparent benefit. By so doing I have been enabled to use up most of my coarse hay, and with a little English I estimate one ton of coarse hay and one ton of turnips fully equivalent to one ton best English hay for sustenance of cattle."

The Pine Barrens of the South.

"X. Y." writes as follows: Along the whole extent of the Atlantic coast, from New Jersey to Georgia, and thence along the Gulf to the Mississippi River, stretches a strip of sandy land, varying from fifty to one hundred miles in width, and known as the "Pine Barrens." On this land, the cultivation of the common agricultural staples is not remunerative; hence the land, while not suited to the production of wheat and corn, may produce other plants of value, and it would be much better to search out such plants as are suited to the soil, than to condemn the land as utterly worthless. By cultivating only, or at least chiefly, such plants as prosper in a sandy soil, we believe the cultivation of the Pine lands can be made remunerative. The watermelon, muskmelon,

squash, sweet potato, &c., are known to thrive better and produce more abundantly in sandy soil than in clayey or even loamy upland, but others have not had so extensive a trial. The groundnut or peanut delights in a warm, sandy soil. It yields abundantly, and the demand for it, for making oil, is unlimited. It is equal to corn for fattening pork. The Scuppernong grape is said to thrive luxuriantly on the dryest sands, sending down its long roots to the marl beds, and bearing heavy crops. If this grape thrives, may not some kinds of the improved grapes be equally suited to such soil? Field beans will often pay where scarcely any other crop will, and some of the pole beans, if not even the Lima bean, may be cultivated, and should be tried on a moderate scale by way of experiment. There need be no fear of over stocking the market with this delicious vegetable. The castor oil bean will pay well on moist bottom lands. We import annually several millions of dollars worth of liquorice. This plant luxuriates in a sandy soil, and, once planted, requires scarcely any cultivation. Instead of importing, we ought to export it largely. The peach, apricot and nectarine are known to succeed well. South of Norfolk the fig stands the winter in the open air, and ought to be cultivated largely. Some years since a planter near Mobile planted a large field with figs, for the purpose of feeding pigs, saying the yield per acre was greater than that of corn, and the pork was sweeter, while the trees required no attention or labor. The arrow-root of Bermuda, and the tapioca or Manihot of Brazil, are also worthy of trial, and will richly reward the labor bestowed upon them if found to succeed. Madder will pay when labor and capital are more abundant. For forage, different kinds of millet and sorghum promise well.

Walks and Talks on the Farm—No. 40.

I have just lost the best cow I had. It was the one I paid the Doctor one hundred and ten dollars for last fall. She died of puerperal or milk fever. It is seldom that this disease occurs later than four days after calving. But this cow was not attacked till the eighth day. She had a hard time calving, and did not cleanse for three days, and then not till we had given her a dose of ergot. After that she appeared perfectly well, and I thought all danger was past. She ate heartily, and gave her usual quantity of milk the morning before she was taken sick. But the next morning she refused her food, and gave only about two quarts of milk, and in half an hour afterwards was trembling all over, and so weak that she could hardly stand. She seemed to be paralyzed across the loins. We put her into a warm basement cellar, where she could not be disturbed. She had barely strength enough to walk in, and had an inclination to stick her head in the ground, which is said to be one of the symptoms of the disease. She soon fell down, perfectly prostrated; our efforts to restore her proved of no avail, and she died in two days and a half from the time of the attack.

In England this disease is called "the Drop," and is most troublesome in dairies where the cows are kept in high condition. Mr. Spooner, an eminent veterinary surgeon, states that, so far as his experience goes, common cows, when highly fed, are more liable to the disease than Shorthorns or Herefords. He says: "In a rather large suckling dairy of Shorthorns, in the vicinity of the writer, the disease is scarcely known but by name; whilst in another, consisting for the most part of Norman and cross-

bred animals, the loss has been most disheartening to the owners. One thing, however, is clear: that the mortality is greater among cows that are highly kept." The Shorthorns, however, that escaped were fed just as high as the common cows, and were quite as fat. The reason why highly fed Shorthorns escape, while highly fed common cows are attacked, is due probably to the fact that the Shorthorns are more accustomed to high feeding. They have been bred for the purpose of converting a large amount of food into beef and butter. What would be an unnatural state of fatness in a common cow would be no more than the ordinary condition of a good Shorthorn. I have a thoroughbred Essex sow that, compared with ordinary sows, was excessively fat, and the Deacon and some of my other neighbors said it was impossible for such a sow to breed. But at ten months old she had a fine litter of six pigs. I have no doubt that a common sow as fat as she was would not have bred. As long as an animal is growing rapidly it should be allowed liberal feed. And in the case of animals that have been bred for generations for the sole purpose of producing a large amount of flesh and fat in a short time, a fleshy condition is perfectly natural and will not prove injurious, unless carried to excess.

A common cow cannot be stimulated to take on fat or give milk with as much safety as a Shorthorn, Hereford or Devon. It is perfectly true, as is sometimes said in opposition to improved breeds, that "they will not stand starvation as well as the natives." And, on the other hand, the so-called "natives" will not stand high feeding as well as the improved breeds. And this is probably the true explanation of the fact mentioned by Mr. Spooner. Those of us, who, like the Doctor, wish to feed high for the purpose of getting a large quantity of rich milk, must get cows that have considerable Shorthorn, Ayrshire or Devon blood in them.

Stephens, in his Book of the Farm, recommends giving cows four pounds of oil-cake a day for a month before and a month after calving, for the purpose of preventing costiveness. Before he adopted this practice he lost two or three cows, but none afterwards. I gave my cow a little after she calved, made into a mash with warm water, but none before; and there I think was the mistake. She was a great milker and had been used to high feeding, and probably needed richer food than we gave her. But she was rather fleshy and I was afraid to give her grain. I am satisfied now that it would have been better to have given her a little corn meal or oil-cake for a month or two before calving.

Misfortunes rarely come singly. I had a number of nice early lambs that we kept in the basement cellar, and when the cow was taken sick we turned them out to make room for the cow. There were two sows in the yard and they got into the pen and ate up five of the lambs.

Have just been reading the Agricultural Annual for 1867. It is quite a book, and I am glad that it is bound in cloth as well as paper. Works of this kind, which are designed for reference, are well worth an extra quarter when bound in cloth. Paper covered books are a nuisance. They are always lying round loose, and are never to be found when wanted.

The editor writes me that he intends to make the next volume much better than this. I suspect he is "fishing for a compliment," or else he is a more modest man than New Yorkers are supposed to be! Certainly this Annual is a most valuable work, though I presume, with more

time for its preparation, the next volume will be better. The "Calendar of Operations" contains many excellent hints, and will be very valuable to young farmers, and those of more experience read them with advantage.

The article on "Tile Draining," by George E. Waring, Jr., Engineer of the Draining of the Central Park, has given me several new ideas which I hope to profit by. I had not thought of putting in "silt basins" in those parts of the drain where there is less fall, and where there is, consequently, more likelihood of the drain choking up from the deposit of fine sand. Of course, in ordinary draining, we need not make such expensive affairs as those used in the Central Park. A hole, dug two or three feet below the drain, and stoned up to keep the soil from falling in, is all that we can afford. But after drains are covered up and are fairly working there is not much danger of their filling up with sediment. The water filters through the soil and is as clear as the purest spring water. The chief danger is from the surface water washing away the soil, more or less, and running in large quantities into the drains. I have several places on my farm where this occurs. Of course this water is not clear and may choke up the drains.

Another important point which Mr. Waring calls particular attention to is "securing the outlet." Of course it is not necessary to have such finished work as that represented in fig. 2, page 55. But I have had one or two drains which discharge large quantities of water into a deep open ditch, which, from neglecting to secure the outlet with stones, &c., have given me more trouble than a little. The soil is continually falling in, and the tiles are carried by the force of the water into the ditch. I have now built them up, rudely, with stones, but the work would have been better done at the first.

The only objection to Mr. Waring's article is that it represents underdraining as a work requiring such accuracy that few farmers would be able to carry it out alone. I have used a surveyor's level more or less in laying out drains, but where a man is acquainted with the land it is not indispensable. Water is a good level, and in two or three cases has shown me outlets, during the wet weather in the spring, that I was unable to discover with the level.

When drains are cut during dry weather, a level, measuring staff, boring rod, &c., are necessary; but in ordinary farm practice draining is seldom done at such seasons. The work can be done much more easily in the spring, when the ground is wet and soft, than in the summer, when it is dry and hard. And in digging a drain where there is water, there is no necessity for a level to determine the grade. Cut the drain so that the water will run away from you, and a little experience will enable any man to clean out the bottom of the drain better than it can be done with a level in a dry season. Where the water runs fast, deepen the drain a little, and you will soon get a sufficiently accurate grade.

The "Finishing Scoop" is an important tool, but there is not one man in ten that knows how to use it. The artist, in fig. 9, has not given the exact shape. The blade, or scoop, should be the same width its whole length, and it should be perfectly straight at the bottom. It should be bright and sharp, with a wrought iron shank that can be bent to the desired angle, and if long enough and perfectly straight a skillful man can make the bottom of the drain as level as a carpenter can a piece of board with a planer. Many farmers take an old scoop shovel, bend up the sides and uses this to clean out the ditches.

But it is too short to make good work. Good "finishing scoops" are not easily to be found. There is not one to be had in Rochester.

Prof. Johnson's account of the experiments made in Saxony on the ripening of rye and spring wheat should attract attention. The results differ entirely from those obtained by Mr. Hannam in England. Mr. H. found that wheat cut two weeks before it was fully ripe gave a better sample, worth 6 cents a bushel more in market, and yielded 4 per cent. more than the same wheat allowed to get fully ripe. Nearly all our agricultural writers have accepted these experiments as decisive on the point, and the majority of farmers cut their wheat at an earlier period than was the case twenty years ago.

The experiments quoted by Prof. Johnson seem to prove that there is a decided gain in allowing grain to get fully ripe before cutting. One hundred grains of rye cut July 18th, when the "kernels were firm, past the milk, straw, yellow and pretty dry," weighed 203 grains; while a hundred grains, cut July 26th, when the crop was "dead ripe," weighed 222 grains. In other words, a crop of rye that would yield 30 bushels per acre, cut at the ordinary time, would yield 33 bushels if allowed to get dead ripe.

The experiments on spring wheat do not show so great a gain, but "the advantage of allowing the grain to become dead ripe, instead of cutting just as it passes out of the milk, is about 5 per cent." On a crop of 30 bushels we gain a bushel and a half by allowing it to get fully ripe.

Of course it is very easy to lose this amount by shelling. But now that we have reaping machines which give us complete control of the crop, we need not be in such a hurry to cut our grain. We need not wait till it is dead ripe, but should let it get as near ripe as we can without running any risk of shelling. This conclusion carries us back again to the opinions of practical farmers when I was a boy. I can well recollect how my father opposed the new doctrine at first, but gradually relaxed a little and cut earlier, to avoid the risk of shelling. As usual, the truth probably lies between the two extremes.

It has been supposed that by allowing grain to get dead ripe there was a loss of starch—that it was changed into woody fibre or bran. But it seems that the rye cut July 18th, when out of the milk, contained 72.2 per cent. of starch, while that cut July 26th, when dead ripe, contained 75.7 per cent—a notable increase.

Prof. Johnson says, in ripening, "the grain becomes slightly, the straw and chaff considerably, poorer in gluten or nitrogenous matters." We suppose he does not mean that the grain contains any less gluten, but rather that it contains more starch; and this would give a less percentage of gluten. Just as in a fat ox there is no less meat (nitrogen) than in the same ox when thin, although the percentage would be less. And so in a fat kernel of wheat, there is no less gluten, but proportionally more starch.

The most interesting part of Mr. Carpenter's article on potatoes is the statement in regard to three neighboring farmers, who planted the same variety of potato (the Pinkeye Rusty Coat).

No. 1—Planted whole potatoes in hills 3 feet apart. Yield 80 bushels per acre.

No. 2—Planted whole potatoes in rows 3 feet apart and 15 inches apart in the rows. Yield 100 bushels per acre.

No. 3—Planted the same distance apart as No. 2, but with sets cut to only two eyes. Yield two hundred and sixty (260) bushels per acre.

The explanation of this astonishing difference is not so much, (probably) to planting sets with only two eyes, as to the fact that No. 1 and No. 2, although they cultivated the land thoroughly up to July 1st, let the weeds grow up and choke the crop afterwards, while No. 3 kept his land free from weeds. All through the season No. 1 and No. 2 had to "mow the weeds at digging time," while in No. 3 "no weeds were to be seen." This is the great lesson that we must all learn—that the land must be clean to produce maximum crops. If you take the weeds into partnership you cannot have the whole profits. They are the worst of partners. They do no work, put in no capital, bear none of the expenses, pay no taxes and have very extravagant habits.

It seems that Mr. Carpenter has been eminently successful as a potato grower. His success seems to be due to three things: 1st. Change of seed; 2nd. Close planting, and 3rd, to thorough cultivation. He plants in narrow rows, only from two feet to two feet nine inches apart, cuts to two eyes and drops the sets from twelve to sixteen inches apart in the rows. He covers the seed with a plow from four to six inches deep. I do the same thing, and some of my neighbors told me I would smother them, or that, at all events, they would be a week or ten days later in getting through the soil than if covered lightly with a hoe. They may be a little longer in coming up, but you can plant that much earlier, and then harrow the ground to kill the weeds just as the potatoes are breaking the ground. If planted deep there is no danger of pulling up the sets or of doing any serious damage to the shoots. With Peachblows and other rampant growers three feet between the rows is near enough. If the land is in good order the tops will completely cover the ground. Flukes could be planted as close together as Mr. Carpenter recommends with decided advantage.

Mr. C. puts ashes and plaster on the rows after the potatoes are up. I have known plaster produce a good effect; but on my soil ashes have never been of much benefit to the potatoes. I should have more faith in 250 pounds of good Peruvian guano, sown broadcast and harrowed in before planting. The ashes and plaster might then be applied afterwards on top with more probability of proving beneficial. I have known 300 pounds of Peruvian guano give an increase of nearly one hundred bushels per acre. This, however, was on land which, without guano, produced only 98 bushels per acre. On rich land the effect might not be so marked; I do not see why we cannot raise 300 bushels per acre.

MEASUREMENT OF UNHUSKED CORN IN THE CRIB.—A Missouri correspondent propounds a question, which we must say, in our belief, defies mathematics or ordinary guessing. He asks for a rule for the measurement of unhusked corn in the crib. Were the cribs equally well packed down, the corn ears year after year, in any district, very uniform in size and well filled, (for nubbins and half-filled ears have nearly as much husk as good ones), there might, perhaps, be a rule given. But the fact is, no two kinds of corn can be relied upon to have the same amount of husk; on different land the same kind of corn will not have the same quantity of husk and cob in proportion to the grain; even on the same field, in different years, the production will vary greatly. After all, the variation will not be so much in the number of ears produced, as in the amount of shelled corn they will yield; while the unhusked ears will have much the same apparent size and amount of husks.

Fig. 1.—EXTERIOR OF CHEESE ROOM.

How Cheddar Cheese is Made.

BY EVA M. COLLINS.

MR. EDITOR: You expressed a desire to go through our cheese-rooms again, and to see how the Cheddar Cheese was made. If you can spare a few moments this morning, and will imagine yourself at my elbow, I will take you around with pleasure. We have a dairy of 40 cows. You remember they used to be milked in a yard.

Fig. 2.—PLAN OF CHEESE ROOM.

A, Cheese Room; B, Curing Room; 1, Furnace with large kettle and closely fitting cover; 2, Steam pipe from furnace to steam chamber under vat; 3, Vat for milk; 4, Sink with strainer; 5, Tank for sweet whey; 6, Tank for sour whey; 7, Curd mill; 8, large table, formerly work bench; 9, Cheese presses; 10, Shelves; 11, Shelf under window.

Now father has milking stables. These are a decided improvement. Most of the cows have learned to drink whey, so we at present do not keep so many pigs as we formerly did.

Do you recognize, in fig. 1, the old door-way to the cheese-room? Do you remember washing your hands in the tank of sour whey in front, after your blackberrying excursion with Willie

Fig. 3.—INSIDE OF CHEESE ROOM.

and I? That stands there still—one of the fixtures. They cannot feed out whey sweet, as it would kill cows or pigs. Father talked about having it carried in pipes, but it would require so much grading that it was not finally done.

Figure 2 is a plan of the cheese-rooms; fig. 3 shows the inside and a view of the vat, and method of heating the milk by steam. The evening's

milk is strained into the vat, and kept cool with covered pails of ice water till morning, when the cream is removed, heated to 86°, and returned to the milk. Frequently both butter and cheese are made from the same milk, but the practice is unknown in our dairy. A ball of annatto, an inch in diameter, is rubbed up in a bowl with a little warm water, in which has been dissolved a half teaspoonful of soda to brighten the annatto, as a high color is desirable in Cheddar Cheese, and the whole is thoroughly mixed with the milk. The morning's milk has been strained into the vat, the whole heated to 90°, the rennet added, the curd has come, and there Mary

stands cutting it up with a wooden knife, fig. 4, into parallelopipedons (isn't that learned!) an inch square at the top. Mary cuts up an entire rennet, puts it into a pitcher with a quart of water and a half pint of salt, and uses about a gill to bring the curd, adding a little water occasionally as that in the pitcher gets low. A good strong rennet will last a week. Calves' rennets differ so much in strength that the only rule possible is to use as little as will do. Mary keeps two pitchers for rennet, and prepares the second one a day or two before she begins to use from it, when, if there is still any liquid remaining in the first, it is carefully strained into the second.

In about half an hour Mary will begin to break up the curd with her hand; moving it gently for twenty minutes, meanwhile increasing the heat to 96°, when one end of the vat is raised by means of the screw, and the process of drawing off the whey commences, and is continued for an hour or two. When it is sufficiently dry, it is weighed, salted in the proportion of 1 oz. dry salt to 5 lbs. curd, cooled off, and pressed in large hoops for half an hour, when it is removed and ground into lumps, the size of a pea, in the curd mill, fig. 5, of which fig. 6 is the cylinder. This turns against a curved surface with similar teeth. By this mill the curd is not really ground, but picked fine. Cotton bags, fig. 7, are then filled with the curd and pressed in seven inch tin hoops, fig. 8, strongly banded with iron, under 1,000 lbs. weight to 20 lbs. curd, for two days. Once during this time the cheeses are taken out, turned, and the bags replaced by bandages. We have one press which holds eight hoops, fig. 9; the others only four. They are then bandaged anew, immersed in a kettle of scalding brine to make a rind impervious to the flies, and stored away in the curing-room, where they are daily turned, and, after the first morning, dressed down with whey, butter and annatto for a month or six weeks. This is the room which you used to say reminded you of pine apples, strawberries and roses. They are taken from this room to the stone cheese-house, where the process of curing still goes on. By

Fig. 8.

and by the shelves, from the floor to the ceiling, will be filled with beautiful little Cheddar Cheeses, fig. 10, just alike, each weighing from 10 to 12 lbs., and about the color of a horse chestnut. The Cheddar Cheeses are made extensively in England, and are imported for this market. The name is taken from the town of Cheddar, in the northern part of England, where they are manufactured on a large scale. Mr. F. W. Collins introduced the idea of making them in this country, in his dairy in Morris, Otsego County, N. Y., in 1862, since which time he has confined his dairy to the production of foreign cheese, mostly of that stamp. The wholesale price has been regulated by the exchange on gold, and consequently has vacillated widely. In 1862 it was 16 cents per lb.; in 1863, 25; in 1864, 40; in 1865, 30; in 1866, it has ranged from 33 to 35 cents per pound.

[The manufacture of the finer varieties of cheese is receiving great attention in the dairy districts. The introduction of the factory system by Jesse Williams, of Rome, a few years since, has had the happiest influence in the improvement of the quality of American cheese, and in the demand for it in other countries, especially England. In 1857 the total export of American cheese amounted to but 6½ millions of pounds. In 1864 the exports from this port alone were estimated at fifty millions of pounds. It only needs suitable care in the management of the dairy to give us the command of the cheese markets of the world. The Cheddar is the highest style of English cheese. It will be seen from the prices named by our correspondent that they are nearly a third higher than the average price of ordinary qualities of cheese in those years. This is a pretty strong argument for absolute cleanliness in the milking stables, and the greatest nicety in the dairy-room.—Eds.]

Fig. 9.

Fig. 10.

THILL AND POLE HARROWS.—It is very desirable to give corn, sorghum, potatoes, and all root crops very early culture. This cannot be well done with implements having teeth which shovel, scrape, slice, or otherwise move much the soil. The best hoe for many purposes is the potato hook, and harrows of various sizes are the best implements for the tillage of such crops. Potatoes require little care, and if planted deep may be harrowed without reference to the rows, but for other crops the teeth must be guided to stir the soil and not touch the plants. Why not bolt a pair of thills and a handle or pair of plow handles to a light (A) harrow? Clods and stones will have much less influence upon it than if drawn simply by the clevis. The thills may be very narrow. With a pole, using two horses, and taking out the middle teeth, the harrow being run astride the rows, the work of corn hoeing might be greatly facilitated. The full efficacy of a harrow is secured only when every tooth does its work and no one follows in the track of another. This may be better secured by using thills and poles than by any other way.

The Opossum.—(*Didelphis Virginiana*.)

This is one of those peculiarly American "institutions," which, after the discovery of the Western World, added much to the interest with which naturalists regarded America. New flowers and shrubs, new trees and animals were expected, but as a general thing these followed in some measure the old familiar forms of Europe. But this wonderful genus (*Didelphis*) in many important respects was an entire anomaly. In the first place, the teeth are more numerous than those of any other then known animal; the hind feet are hand-like, being furnished with a sort of nailless thumb, so that the animal can grasp a branch; the naked tail is prehensile, enabling the animal to use it in climbing or to suspend itself by it, as in the picture, and, more astonishing than all, the females have a belly pouch in which the young are reared. This pouch is common to the order of marsupial animals, which is the prevailing type of the mammalia of Australia—the kangaroo, for example. The Opossum Family includes ten or twelve genera and perhaps fifty species, some of which are not much larger than a common mouse; but the Opossum is the only one found in the United States, and from its size is one of the most important and interesting. Its head is long, the nose straight and pointed, teeth numerous and sharp, ears thin, dark at base and bordered with white; fur gray, composed of fine soft wool, with many long white hairs; color on the back and legs darker. The Opossum weighs 10 to 14 pounds, is quick and active among the branches of trees, but clumsy on the ground. When pressed to close quarters it feigns death, and shows no fight, but watches an opportunity to escape. From this well known habit comes the expression "playing 'possum." A nocturnal animal, crafty and stealthy in its motions, feeding upon fruits and vegetables to some extent, but particularly fond of eggs and young birds,

the nest of many a poor bird is robbed. Young mice are greedily devoured, and many reptiles also. In fact there is little animal food not acceptable, provided the Opossum does not have to fight for it. The birth of the young seems to be a matter of mystery. When first discovered they are minute, blind, naked, shapeless

OPOSSUM—(*Didelphis Virginiana*.)

things, weighing only a single grain each, and each attached to a teat, of course within the protecting marsupial pouch. After some fifty days, having gained sight and fur, and being about as large as little mice, they begin to run in and out, though remaining most of the time attached to the teats; when their size is so great

The Green Turtle (*Chelonia Midas*.)

This animal belongs to the family of Logger-head Turtles. It is common in our markets, but rarely appears upon the coasts of the Atlantic States, except Florida, though occasional specimens have been found as far north as Long Island. It is an inhabitant of the deep sea in the neighborhood of the West India Islands. It is well represented in our engraving, and has little the look of our land or fresh water tortoises. The feet are really fins, and are exclusively used for swimming, except when they come upon the shore to lay their eggs. These they lay in hollows dug in the dry sand, high on the beach. One hundred and fifty to two hundred eggs are laid in a place, they are covered with

sand and left to be hatched by the sun. At these times the turtles are taken, and shipped in great numbers to the markets of the United States and Europe. They weigh from two hundred to four hundred pounds. Considerable pains is now taken on many of the West India Islands to prevent the destruction of the eggs

and of the turtles before the eggs are laid. When the young hatch they shuffle away down to the water and are seen no more until they appear of full size, living apparently continually underwater. They feed upon a kind of sea weed called turtle grass. The general color of this turtle is olive green, and the fat has a greenish hue. They never bite, we believe, but sometimes strike with their "flippers." In market the fore and hind fins on the same side are usually tied together by a cord passed through

GREEN TURTLE AND SALT WATER TERRAPIN.

that the pouch will not hold them, they are said to cling to the mother's back, coiling their tails around hers for additional security. The Opossum is found in all the Atlantic States south of New-York, occasionally in this State, but not east of the Hudson River; and southward and westward. Its flesh is excellent, usually very fat, and resembling that of a sucking pig.

the leathery web. The flesh of these animals is savory and tender, being cut into steaks for broiling or frying, and those parts unfit for steaks are used for the popular "green turtle soup."

THE SALT WATER TERRAPIN (*Malacoelemys palustris*.)—The little fellow at the left of the picture is another favorite of the epicure. The Salt Water Terrapin inhabits the salt water

marshes from Rhode Island to South America, during our Northern winters burying itself in the mud. Taken at this time it is fat and delicious, and greedily sought for in our City markets. Each plate of the upper shell is marked with deep striæ parallel with the sides. These are deepest in the males, and the males are considerably less in size than their companions. These Terrapins are very active on shore, and expert swimmers—on the alert and ever suspicious of danger, except when hibernating. They are about $7\frac{1}{2}$ inches long, the shell being of an olive green color, with darker concentric markings on the scales. The under shell or *sternum* is yellowish green, with dusky markings, and the legs and neck of a light brown, inclining to white, with innumerable black dots.

Carrot Culture.

BY M. H. SILVERTHORN.

Select a good rich piece of clover sod, with deep loam or gravel soil; put on twenty loads of good manure to the acre and spread evenly over the ground. Then plow the ground about six inches deep. I once failed entirely to raise a crop because I plowed my ground too deep; the seed would not germinate in the soil turned up. I do not think it advisable to undertake the culture of carrots on clay soil with a stiff subsoil, as the cost of them will exceed the profit.

After plowing, harrow fine; harrow the last time the short way of the piece; then drill in the seed the long way, in rows, two feet apart.

I prefer to raise my own seed, as it grows much more sure than seed purchased at the stores—use fresh seed. I usually raise the White Belgian, as I can grow more to the acre than of any other kind. Still I consider there is more nutriment in the same amount of the Orange carrot. The best tool that I have yet used is of my own invention.

The frame is similar to that of a common cultivator, and about the same length, but only about two-thirds as heavy—in this I have eight teeth. The teeth are about ten inches long from the shoulder to the point. The blade is similar to the coulter on a plow, except it is only about $1\frac{1}{2}$ inches wide and brought to an edge. These, with a good cultivator shovel for the front tooth, complete the implement.

With this cultivator and a horse, you can commence to work your carrots as soon as they are up, cutting up the ground deep and very close to the carrots without covering them up, thus saving five-sixths of the labor usually spent with the hoe, and leaving the ground in much better condition than it otherwise could be. After the carrots are about as big as a pipe stem, I take my hoe the narrow way, and cut the rows into hills, leaving them, when thinned out, about six inches apart. After this you have no more to do with the hoe, but use the cultivator occasionally. To harvest, plow around the patch, just as close to the row as you can without cutting the roots. Now let your team stand, take a good butcher knife, catch the top of the carrot in the right hand, pulling it out of the ground, after which take the root in the left, and turn the top down—now, with one clip, cut off the top and throw the carrots in piles on the plowed ground, and tramp the tops in the furrows—now, plow about twice around, and you are ready to pull and cut as before. In this way myself and one other hand have harvested and buried one hundred bushels in half a day.

Carrots should remain in the ground as long as

they can be left, and be got out while the ground is dry, as they generally improve till freezing weather, and they keep much more fresh than when harvested before they are fully matured. Still they should be dug when the ground is dry, for the carrots come out clean, and need no washing before feeding. Dirty carrots never should be fed to any kind of stock.

Every person should have a good root cellar attached to the barn. After your carrots are harvested, put in the cellar about what will last till midwinter, and bury the balance, as they keep much fresher when buried than in a cellar.

Carrots have no great fattening properties, but when fed with grain they are much better than either fed separately. I have always found it more advantageous to feed, say to a horse, four quarts of oats and six to eight good sized carrots than eight quarts of oats with no carrots, or than double the amount of carrots with no oats. Carrots alone, are most excellent feed for cows in the spring, before grass comes; chopped fine and mixed with ground oats, they make the best of feed for sheep having early lambs.

[Deeper plowing than six inches is advisable in rich sandy loams, and in all heavy loams sub-soiling will pay. The tops of carrots make excellent feed, and we think it pays better to feed them than to turn them under. In some districts they are sold to dyers, at a good price.]

Driving Horses at Plowing.

[The following sensible notions about plowing are from "T. C." of Paulding County, Ohio. The docility of the horse, under proper training, is such that lines need only be used at plowing, in an emergency; but horses can seldom be trusted without some control upon their heads.—EDS.]

"The subject of driving horses before the plow is an important one to every farmer, for good driving and good plowing go together, and good, easy plowing is no small item in farming. I have seen one man take a team to plow, and permit them to walk so fast that they had to stop every few rods to breathe, and thereby lose more time and injure the team more, and not make as good work by far as if they had been driven more slowly; and I fear this is the practice of thousands of the readers of the *American Agriculturist*. I have seen another man take two old horses that had been used singly in a buggy, one much lighter and much faster than the other, and (neither of which had been used to plowing), hitch them to the plow, and in a short time have them go step by step with each other, what pace he wished, and so straight as to surprise his employer. While the former plowman made bad work by letting some slices fall back, setting some on edge, and leaving dead furrows from two to three feet wide, the latter would turn all well over, and in finishing up would leave a dead furrow only the breadth of the plow, and as straight as need be, without making any 'turns' or short furrows. The good plowman did his work much easier to himself and team than the other. Both pieces were in corn, and that best plowed was easiest tended.

"The best way that I know of to tie horses that are in the habit of going too fast is the following: Use the cord lines, (those thick at the hind ends are best for lazy horses), instead of the short stick between their heads. I prefer a coupling strap, with a spring hook at each end, and buckle in the middle, or a cord line will do. We do not want horses always the same distance apart, especially in finishing up, and besides the stick is not pleasant to a tender-

mouthed horse when turning round, especially if the driver does not believe in it, or if he is not kind to his team. If one horse is faster than the other, instead of hanging the check rein on the harness as usual, put it back between the hames, tie a short line to the middle of it, and tie the other end of the short line to the other horse's wiffletree, or to his trace forward of it. When the fast horse steps forward he steps into his 'bit'; if he has a tender mouth he may 'rear,' but by the time his feet are off the ground the other horse makes a step, and his rein is slack, and he will learn to go slow before he gets tired. If both horses are too fast, tie them both in the same way. As to driving, every good plowman establishes a communication between himself and his team peculiar to himself—not, however, by putting the lines round the back, nor by hanging them on the 'handles,' unless they have more practice than is usual on small farms. The boy that took the prize without lines had practice. The place for the lines is in the plowman's hands, where he can let one slip through his fingers, or gather it in, as needed. With lines, properly used, words are seldom needed; and with sufficient practice words properly spoken do away to a great extent with the use of lines. 'Come' and 'gee' are all the words necessary, besides speaking to each horse by name; they should be spoken to kindly. If a horse is lazy, a stroke with a cord line shows him his pace much quicker than unkind words. I know of no surer way to break up a bad practice than that which induced the boy to drive his team without lines—namely, the offer of a prize."

Screens for Shelter.

Screens are planted for two purposes: the concealment of objects offensive to the taste, and the shelter of buildings, gardens and orchards from the winds. It is of screens as a shelter that we purpose to say a few words here. The importance of shelter in our northern climate is but little understood. It answers several economic as well as esthetic purposes. No country home has its appropriate surroundings until evergreens are planted. It is cheerless and desolate in winter—it lacks the highest charm in summer. By the shelter of evergreens, we may change the temperature of the seasons, and give gardens and orchards the climate of regions four or five degrees further south. The violence of the prevailing winds may be completely broken, so that the thermometer will not sink so low in winter, and the snow, instead of drifting in heaps and leaving many places bare, will spread its soft covering evenly over all delicate plants and preserve them. Many of the difficulties with which the gardener and orchardist have to contend, may be obviated by the shelter of trees. One reason why grapes and other small fruits do better in cities and villages than in the country, is the fact that they have the shelter of yards and buildings. Train an *Isabella* upon a trellis in an open field, and you may not get a crop once in five years. Put it upon the south or east side of a building, and, with suitable feeding and pruning, the crop is generally as sure as that of Indian corn.

One of the best examples of the ameliorating influences of shelter upon climate that has ever fallen under our observation, was upon the farm of the late Judge Meech, of Shelburne, Vt. His homestead was near the shores of Champlain, and swept by the severe lake winds in the winter and spring. He inclosed about two acres with a screen of *American Arbor*

Vitæ, that being the most common evergreen of the region. Within this inclosure he could raise the grape, the peach, and other fruits that would not mature outside. The effect of the screen was to give his garden the climate of New York.

There can be no doubt of the economy of planting screens in cold climates around gardens and orchards, wherever there is sufficient room for them. A screen, unlike a hedge, does not require close planting, and not much shearing or attention of any kind, after it is once established. As to the plants that will serve this purpose, deciduous trees are better than nothing, but they are not nearly so effective as evergreens; and if one is to be at the expense of planting it is better economy to plant the best.

There are several varieties of evergreens that make perfect shelter, and we should be governed in their selection mainly by the cost of the plants and the facility of transplanting. We put at the head of the list the Norway Spruce, and this conifer has been so extensively imported for

SCREEN OF NORWAY SPRUCE.

the last dozen years or more, that almost every well established nursery has a large stock, and they are as cheap as any other tree. Many nurseries have evergreen trees fit for no other purpose than screens, or to be cut up for stakes and poles. The Hemlock is another admirable tree for this purpose, and if we could find plants that had been properly grown, we should prefer them to the Norway Spruce. The foliage is more beautiful, they are a perpetual feast to the eye, but unfortunately they are exceedingly impatient of removal. It is rare to find a nurseryman that knows how to grow a Hemlock, and hardly ten per cent. of plants taken from the woods, with ordinary treatment, will live. Next to this we place the American Arbor Vitæ, which is abundant and easily transplanted. The White and Black Spruce, and the Red Cedar, also, make good screens. So much depends upon keeping the roots of evergreens moist during transportation that we should be governed mainly by location and price in selecting any one of the varieties here mentioned.

If the soil is rich enough to bear sixty bushels of corn to the acre, it will require nothing but mechanical preparation—plowing with the surface and subsoil plow. It will pay to loosen the soil to the depth of eighteen inches. If enriching is called for, use no fresh manures, but a compost made of peat and ashes, or muck and lime. Ashes are always a good dressing for evergreens. The distance of planting will be determined somewhat by the size of the trees, and the immediate objects aimed at. With Norway Spruces ten or twelve feet high, an effective shelter may be made at once. We have succeeded admirably with trees of this size, losing less than five per cent.—planting them so that the limbs just touched. They were put out, with good balls of earth, the same day they were taken up. It is safer, however, to plant smaller trees, and closer together, even if you have to take out the alternate trees two or three years later. A screen for an apple orchard may be left to grow twenty-five or thirty feet high, and in this case the trees should be at least ten feet apart to give the requisite strength at the base.

The screen will require much less attention than the hedge, but it is good policy to keep the ground cultivated for a few years after the planting, and to bring out the bottom limbs well by shearing those above. All the different kinds of evergreens we have named bear the shears well, and can be readily trained in the way they should go, with a little timely attention.

Smallness of Cob Very Desirable in Seed Corn.

The selection of seed corn is one of the most important things which a farmer does at this season. Coarse cobs accompany late maturity, as a rule; fine cobs, well tipped out, indicate perfect maturity, adaptation to the season and soil, and a fixedness of character which it is important to maintain. The curing of corn takes place to a great extent after husking, and the presence of a great, soft, moist cob in each ear gives a tendency to mold, which should be sedulously avoided. The old experiment of fitting a paper cone to an ear of corn, then withdrawing the ear, shelling it and returning the kernels to the cone, is interesting and instructive. If the kernels will all go easily into the cone, the cob is too large, and we should say, the corn unfit for seed. The cone should be made of brown paper, dampened, bound tightly around the ear, coming no higher than the kernels, but covering all; the ends are trimmed off, and it is allowed to dry before the ear is drawn out. One may easily judge by the eye which ears have the smallest cobs—those which are best tipped out, which have the kernels in the closest rows, and all the rows running unbroken from end to end. These ears will not be found among the biggest round, nor among the longest, usually, but among those of medium size. A friend used to say, as he showed off his seed corn, "every ear as regular and solid as a white-oak pin." And so they were, as nearly as corn ears could be, firm, close, hard and solid.

Cotton Culture.

BY F. G. DWIGHT.

[Our offer of two premiums for prize essays upon this subject has been responded to, and the first premium has been awarded to Joseph B. Lyman, a recent cotton planter in Louisiana, and the second to F. G. Dwight, whose experience has been in the Atlantic Seaboard Cotton States. Both essays will be probably published in one volume, in season for the next year's operations. For the immediate benefit of our readers in the cotton growing districts, and of the large class who are contemplating a removal thither, we give in this issue the first of a series of articles culled from these essays.—Eds.]

BEDDING UP.—After the fields have all been plowed the work of bedding commences. One hand leads off with a scooter plow, and marks rows, running through the whole length or width of the field; others follow with turn plows, and throw two or more furrows on each side of the marks, making a slightly elevated bed, the number of furrows to be turned depending on the width of the spaces between the rows. A small water furrow is left between the beds to serve as a drain after heavy rains. Where the land is not likely to wash, and there is a good deep subsoil to readily absorb rains, *flat culture* is often practiced. In this case the land is thoroughly plowed as before, and if possible cross plowed, bedding up being dispensed

with until seeding time, when slight beds are thrown up in the process of planting.

COTTON ROWS.—In marking out rows, it is recommended that they should be laid out east and west, in order to be as much as possible exposed to the sun at all hours of the day—cotton being of all others a hot weather plant. This distinction can be observed on level ground, or such as is slightly rolling, but where there is much fall, attention must be paid to safeguards against the land washing. On hilly lands, curves should be followed around the sides on a level.

The probable productiveness of the soil must determine the distance between the rows; the poorer the soil the nearer should they be. On land that is not well known to be *very* good, it is safest to let the distance be about 20 inches or two feet, so that in getting twice as many rows on poor soil as would be put on land admitting of four-foot distance, the difference in the yield of a crop grown on good and only tolerably good land would not be very great.

PLANTING.—The cotton plant in its early growth is very tender, particularly when in a crowded state, it cannot withstand frost and is even very sensitive to cool weather. As early planting is generally recommended and will be found to be the most successful, caution must be exercised not to plant *too* early. To replant is discouraging work, involving much loss of time. In the Gulf States from the 25th March to the 10th April is the usual planting season.

DETAILS.—The hands that are selected to drop the seed must be furnished with bags or "wallets" large enough to hold about half a bushel of seed. These are suspended at the right or left side by a rope or strap over the shoulder. With the scuter plow, a seed furrow is opened to the depth of three or four inches in the middle of the bed, the hands following the plow and dropping the seed as even as possible.

Careful supervision is needed. The best of the freedmen are not easily impressed with the importance of dropping the seed regularly. They soon get careless, and if you are not on the alert, the young plants will come up in patches. Light furrows are thrown towards the opened row to cover the seed, one on each side. If left in this condition the seed would be covered too deeply; and after one field is planted, the wooden scraper, fastened to a plow stock, is drawn over the seed row, taking off all unevenness of surface, removing the excess of covering, and leaving the bed in a neat condition, somewhat elevated above the water furrow.

IN FLAT CULTURE, where there has been no previous "bedding up," the seed furrows are opened at proper distances. Seed dropped and covered as before; then successive furrows are thrown towards the seed row until the space between the rows is plowed up, leaving a shallow water furrow midway between the beds.

Again, on very good land, and where the soil is in fine working order, the labor of plowing previous to planting is sometimes dispensed with. This "short cut" way, however, is not to be recommended. Whenever this *must* be done, the process is simply to open furrows at the proper distance apart, drop the seed and cover as before. One or two furrows are then thrown up with the turn plow to complete a bed, and the middle broken out with the sweeps; the wooden scraper being used to level off the beds.

YOUR PERSONAL SUPERVISION.—Every day during "planting season" is necessary to look after the furrow opening, planting, covering, plowing and scraping off. Permit no careless-

ness or slighting on the part of any one engaged in the work; it must all be done well and promptly. See that the seed furrows are opened in a straight line, to facilitate the after culture.

The seed dropper should walk with a regular gait along the side of the furrow, letting the seed fall from his hand *evenly*, and as much as possible *right in the middle*. Let him stop when empty, and as soon as he has another handful, step on. In covering the seed row, the plow hand must be "wide awake," keep his plow under control, and see that the soil is sufficiently thrown over to cover *all* the seed. The most experienced hand should hold the scraper, otherwise too much soil will be "knocked off" here or not enough there, leaving the seed exposed in one place, and in another covered with earth so deeply as to endanger its never coming up.

DEPTH TO COVER SEED.—It need be but *thinly* covered. In light, dry soil an inch to two inches will be enough; in heavier soil less.

Fig. 1.—HAY BARRACK AND COW STABLE.

Jersey Hay Barracks—Roofed Stacks— The Poor Man's Barn.

Last year we presented our readers some rather elaborate barn plans, and many complained that they were extensive and expensive, and had little interest for them. They were wrong in this, for the plans were full of good hints for all. It occurred to us the other day that the structures, of which we give some engravings, were really very philosophically devised, and that many whose means do not permit them to build such barns as they would like to, might be profited by a lesson from the "Jersey Dutch." The affair called in New Jersey a "Hay Barrack" is really a stack cover—a light square roof, made to be raised and lowered, and set at any desired height between four corner posts. These posts are about eight inches in diameter, and twenty-three to twenty-four feet long, and are set 3 to 3½ feet in the ground. The roof is made upon the ground and then raised to its place, where it is held by pins. Thatched roofs are made by fastening four substantial rails (square or round) together by ganes and pins near the ends; to these rails light poles, many of which reach the peak of the roof, are fastened, and upon them thatch is laid, usually in a coarse manner. It is important that the roof should be very light. Hence thatched roofs are preferred, and barracks 12+12 are better than those of larger size.

Another kind of roof is that seen in fig. 2, where boards, the upper ends of which are not only sawed to fit, but chamfered off to match, are simply nailed together upon the ridges, and to the plates forming a "hip-roof." Sometimes

Fig. 2.—BOARD ROOF TO BARRACK.

they are battened on the ridges, and over the cracks between the boards, and sometimes not. Either of these roofs will last many years, and, as stack covers, save many times their cost. The lower part of the hay or straw stack is often protected from the cattle by perpendicular boarding, nailed to rails or studs set between the posts. This siding extends six to eight feet from the ground, as seen on the sides of fig. 1, and the transition is easy from this to the cow stable, which is there represented. In this case there are four strong rails or joists spiked to the posts at the desired height (say seven feet), and a flooring of boards or rails—the tighter the better—is laid upon them, and the hay, straw or grain is put above. Thus a 12+12 feet stable is made, and a door is swung as shown. There is room for three cows and a horse to stand comfortably. Holes may be cut or bored for ventilation if needed. If the side boarding is double, and leaves or straw are stuffed into the space between the sides, the stable will be a very warm one. If two or three barracks are placed close together, forming an angle or three sides of a hollow square, cows or horses may be very well protected in our severest winters.

Another plan for a shed under the stack is seen in fig. 3. Common fence rails are set up against the rails which support the hay, and a few slabs driven into the ground on each side and nailed together to contract the entrance. The sloping sides may be thatched with spruce or hemlock boughs and sods, and thus made very warm and comfortable. This makes an excellent fowl-house also; and if the south side

Fig. 3.—BARRACK WITH SHED BENEATH.

were to be glazed, two or three sashes being inserted, and the whole made tight, it would be as good a winter laying house as could be desired.

We remarked that the affair is philosophically

devised. Well made stacks keep hay as well as it can be kept in a barn. The difficulty is that it is expensive to thatch and rope a stack so as to make it shed water perfectly, besides vermin have a little freer swing at the grain and grass seed; and when a stack is cut into or partly taken down, it is at once more or less seriously exposed to detriment by the weather. All trouble about covering and protecting against rain after the stack is used from is removed by this contrivance, and the warm, snug little stable beneath, for a poor man, or for any one as a temporary expedient, may often be very convenient.

Design in Feeding Stock.

Some farmers fail to adapt their feed to the particular wants of their stock, as if all that was needed was to give them enough to eat. But different kinds of food produce different results.

For example: if I have a steer, which is already well developed in bone and muscle, but which I wish to fatten for market, I should give him linseed or cotton-seed oil-cake, or Indian meal, or shorts. If I wish to encourage the growth of colts or calves, or other young animals, I should give them a variety of feed, but especially good hay, ground oats, or oats in the sheaf, cut tolerably fine. Corn meal, barley, and buckwheat are also useful for this purpose. A working team, whether horses or oxen, demand food which will supply the waste of muscle and a fair amount of fat. When spring work is about to commence, after seeing that my teams are reasonably fat, I should give them oil-cake, oats, and good, bright hay, or cut straw. Oats (ground) will supply muscle, and give greater power of endurance, in hard work or fast driving, than will corn meal. Then, to make the bill of fare complete, I should give an occasional meal of carrots, or potatoes, or turnips. These will aid the digestion, sharpen the appetite and promote the general health. If feeding for milk, I would continue this bill of fare in a measure, and give oil-cake, corn meal, shorts, or bran, with good hay or stalks cut fine, and roots, such as beets or carrots. G.

The Sheep's Foot—Biflex Canal—Fouls.

If we examine a sheep's foot externally we find the hoof or horny portion presenting three distinct forms. First, the outer walls, hard, horny, sometimes smooth, as is usually the case with the mutton breeds, as the Southdowns and Cottswolds—in others, much corrugated and rough, as with the Merinos. Second, the inner walls, or walls of the cleft, less firm, somewhat sealy and fissured on the surface. Third, the sole, of much the consistence of the walls of the cleft, but thicker, and elastic from resting upon a soft, spongy cushion, which covers the bone, and forms in a measure the base of the heel. If we spread open the cleft between the toes, and examine it closely, we find a small hole, apparently in the skin, shown in fig. 1, into which the head of a pin may be easily passed. It is the mouth of what is called the "Biflex Canal," and is a peculiarity of the foot of the sheep, other cloven footed animals not having it. The canal, as shown in section in fig. 2, is about an inch and a half in length, curved like a horseshoe, and has but one opening. The sheep books are particularly vague in their allusions to the Biflex or Interdigital Canal, and it will, we doubt not, surprise many of our sheep raisers to know that this canal exists, and others that it is not an "issue" or mouth of some tube connected with a secre-

tory gland, but an inflection of the skin, the canal walls being like the adjacent skin, and really forming a curious little sack, lined with hairs, and secreting a sort of yolky, gummy substance. Its use seems to be to provide an elastic cushion to spread the toes apart, and perhaps also a viscid secretion to protect the tender skin between the toes, where it is so easily

Fig. 1.—MOUTH OF BIFLEX CANAL.

washed away, and where abrasions and slight injuries are liable to occur. Were the skin between the toes formed to exude enough of this secretion, it would, of necessity, be more tender and liable to injury and disease than it now is.

We know of no disease of the Biflex Canal, except stoppage at its mouth, which causes inflammation and swelling, and similar inflammation caused by some foreign substance being introduced. Instead of lancing and trying to cut out the "worm," as some people think it is, the sensible treatment is to procure a fine pointed ear syringe, and, after opening the mouth, wash it out with castile soap and warm water, and grease the parts with tar mixed with lard. This Biflex Canal has been charged with being the cause of the rot, and though this view is generally scouted at now-a-days, we are by no means sure that it may not be guilty sometimes, to a certain degree; for certainly any cause which will render the skin harsh and inflamed, or subject to injury

Fig. 2.—BIFLEX CANAL. Fig. 3.—STRUCTURE OF FOOT.

from long grass or vines of any kind caught between the toes; puts the foot in the best condition to be poisoned by the virus of the hoof-rot coming in contact with the inflamed part.

FOULS.—When this condition of inflammation of the skin in the cleft of the foot, from any cause, becomes established, and a wet soil keeps the hoofs moist, and greasy or yolky matter from the Biflex Canal is constantly washed out, the then disease known as "the Fouls" occurs.

It is easily cured by cleaning and greasing the parts, and putting the sheep on dry pastures. If, however, it is neglected, it is liable to introduce hoof-rot—the subject of another article.

If we examine the internal structure of the foot we find that the horn is attached to the sensitive portion above, at the crown of the hoof and at the sole, by what is called a papillated surface. Lower down we find that the horn on its inner surface is split into an almost infinite number of delicate leaves or *lamellæ*. Between these leaves of hoof are sensitive leaves of the vascular membrane which covers the whole surface of the horn. These two sets of lamellæ, or leaves, are as if we were to take two books and lay the leaves of each, leaf for leaf, between those of the other. The structure is very beautiful and easily seen in the hoof of a horse, which, after the flesh has decayed, may be washed out and will show the horny lamellæ very clearly. The sensitive lamellæ are seen in figure 3, as also the papillated structure at the crown and sole. From this papillated surface the hoof grows, and it is an inflammation of this which constitutes the hoof-rot. The same membrane—full of the papillæ by which horn is formed—covers the whole foot and secretes horn at all points; where it is the thickest and most vascular, as at the crown and sole, there most horn is formed, but on the lamellæ, little.

Adobe and Concrete Buildings.

The name *adobe* is applied to building material in the form of bricks, but unburned. It is not necessarily clay, but it must be of a clayey or loamy nature, and so firm when dried in the sun as to be easily handled, and to sustain considerable weight without crushing. This is distinguished from concrete by its containing no lime or cement, and being always used in the form of bricks. The concrete is a mortar of sand and lime, usually hydraulic lime or cement, in part at least, especially such as is used for foundations, in which the proportion of cement preponderates. This is laid up in the walls as it is to remain, and the largest possible quantity of gravel and larger stones is worked in. The

present high price of building materials leads farmers to look anxiously for some good substitute for stone, brick and wood. The need for the dissemination of knowledge on this subject is great, especially throughout the Prairie States. A correspondent in Iowa pleads for information, definite and full, about adobe building, which we shall try to give, and would be glad to give also particulars of the experience of any of our readers who have tried, and either approve or condemn this material. Our correspondent writes as follows:—

"The high price of the material would be but a small evil, provided we could obtain it. The fact is that now throughout the Northwest we go without farm buildings nearly altogether. Tumble down stables, made of poles and straw, ornament at least one-half of the farms. The sides, which are of straw, slip down and are not repaired, letting the cold wind in without hindrance, and the water drips through the covering for days after every rain. Even of those well-to-do farmers who have barns not one in ten has shelter sufficient to protect all of his domestic animals. I sometimes dream of warm stables, filled with rows of contented

cattle, nice and easy, with the straw up to their knees, but alas! save only the 'straw up to their knees,' I fear it must ever be only a dream throughout all Prairiedom. If you would take hold of the matter and show us what to do, and how to do it, you would in that particular alone confer an immense blessing upon the country."

A Simple Ventilator.

"H. W. P." sends us a drawing of a simple apparatus, devised by the writer (and by others, very possibly), to be fastened with small screw-bolts to the back of a stove—in this case a sheet-iron air-tight—for the purpose of introducing to the room a constant supply of fresh warmed air in winter. It works admirably. The box is 9 x 10 x 2½ inches, made of sheet-iron. The pipe of zinc, 4 inches diameter, with a damper, descends beneath the floor, and thence runs under the floor and through the north wall of the building, to secure the force of the pre-

SIMPLE VENTILATOR.

vailing north-westerly winds. A west wall would, no doubt, be equally well. A strong current of air rushes in, is thrown against the back of the stove and the underside of the stove pipe, whence, perfectly warmed, it diffuses itself through the room, is cooled by contact with walls and windows, descends to the floor, and is drawn off by the draft of the stove, or through an opening in the chimney near the floor, thus giving place to a new supply. Tight double windows render the system more complete and add vastly to economy and comfort.

Home-made Baskets.

BY SALIX.

I observe your call for information as to how willow baskets are made. Having often, when a boy, seen my father's plowmen make baskets for farm purposes during the long winter evenings, I will endeavor to tell you how it was done.

The willows were never peeled, but were soaked in water in a long pig trough. The

Fig. 1.—HOOPS.

hoops, ribs and handles were generally made of split ash. Two ash splints were bent into hoops and placed one within the other, but at right angles, as shown in figure 1, *a* and *b*. If the two hoops are round, of the same size and cross in the middle, the basket will be round—that is hemispherical. If the inner hoop, which forms the top of the basket, be the larger, the

basket will be more or less oval. Having arranged the hoops, take the willow rods and weave them, as in figure 2. As the semi-circle enlarges, insert the ribs, bent as shown in figure 3, and of such size and form as to regulate the shape or contour of the basket, as shown at *d*, figure 4. The splints, if well soaked, can be easily bent into any shape. Weave willows

Fig. 2.

among these ribs or hoops—it being simply done—out and in, out and in, until the semi-circle reaches down the side of the basket to about the dotted line (fig. 4). Then commence on the ends of the basket and weave willows down the ends and along the bottom, as

Fig. 3.

seen on the right hand end at *e*, (fig. 4), putting in more of the ribs (fig. 3), if the work is large and consequently open. When you have the ends and sides well woven, the basket is finished, so far as strength is concerned. You can not pull it apart. But there will be gores or vacant spots left. Fill these up with weaving, and your basket is done.—It matters little where a willow ends, provided it does not end at the top without going round the upper hoop. The wet willow twigs will bend easily and take any form, and yet when dry they will be hard and stiff, and can not be unwoven. Push the several layers of willow close together and pull them tight, and they will hold very firmly.

After the basket is dry, trim off all straggling ends with a sharp knife. A little practice, and perhaps the spoiling of a few baskets made with materials that are quite cheap, will enable you to make an article worth a dozen of what you

Fig. 4.

can buy. Do not give it up if you cannot make a neat job at first. A little care and patience, with a medium of practice, will set you all right.

[Several kinds of willow may be employed. The common white and yellow willows answer very well, but the basket osiers are superior on account of the slenderness of the rods. The white willow rods are strong and pliable, but not so delicate and long. When peeled and bleached with the fumes of burning sulphur, very beautiful work may be produced. Rods for basket making are best cut in the autumn, for the good of the stock, but may be cut for

use at any time after they are sufficiently grown, and before they branch in the spring.—Ed.]

Investing in the Farm.

Leonard D. Clift, of Carmel, Putnam Co., one of the best farmers New York has ever produced, was wont to say of his own course in life: "I have pursued a different policy from farmers generally. Some of them have skinned their farms, brought up their children in ignorance, given little or nothing in charity, and have reached old age with barren farms, uncultured children, and narrow views of life, but they have *cash in bank*! On the contrary, my surplus earnings have gone to enrich my farm, until it is capable of yielding an abundant support; my children have been educated, and now occupy respectable positions in society. I have felt it a privilege to give in charity; my table has been bountifully supplied, and my house open to the stranger. All this I have, but not money in bank; and I am satisfied with my choice."

He went to his rest on the 9th of September last, at the age of 73—patriot, sage, counsellor and friend, leaving his beautiful homestead and his good works as his fitting monument. This farm was the work of his lifetime, and we wish to commend to our readers that sound policy which made his one of the model farms of the Empire State. It took the premium in 1855 as one of the best grazing farms, and the report of the Visting Committee may be found in the Transactions of the State Ag. Soc. for that year.

He reprobated that policy of skinning the soil which, we are sorry to say, has been the prevailing style of husbandry even in the North and East, and which is still the worst feature of farming all over the country. Men have no faith in the capacity of the soil to reward them for the labor and money they expend upon it. They get a good crop of grain or roots from the land, and instead of investing the proceeds in more manure, more improvements or more stock, they invest in more land or more bank stock. Many a man has pursued this course with his farm until its fertility has been almost exhausted. He has transferred all its fatness to the bank, and it will not now sustain ten animals so well as it would fifty, fifty years ago. He may have grown rich in money by the process, but his farm is ruined. Go through the older farming districts of any of our seaboard States, and we doubt if the majority of the farms will carry the stock they grazed and fattened two generations back.—They have lost so much in fertility that not even the improved tools and husbandry of the present day can make them pay so well as they did then.

The Carmel farmer had faith in his business, and felt that his surplus earnings were safer and better invested in the soil, under his own management, than in the bank, under the management of others. He literally cast his bread not only upon the land, but upon the waters of his farm, not doubting that it would return again.

He put money into dams and sluice ways; and the brook that had run to waste for ages was turned over his meadows, and set every blade of grass it fertilized to coining money for him. He demonstrated that irrigation alone would keep up the fertility of meadows, improving the quality and increasing the quantity of the grass. He gave us one of the best conducted experiments in irrigation—worth millions to the State, if his example were only faithfully followed. The stream that was barren to others became a Pactolus for him, flowing over

sands of gold. He had faith in drains, and the rough land was cleared of its stones, and sluice ways for the passage of water were formed beneath the surface, making the drained field of fourfold value for all its future history. He believed in improved stock and invested largely in it both for milk and beef. He expected to get more milk and more beef from a given number of cattle, from the fact that they had been bred respectively for those qualities; and he succeeded in his object. He had faith in home-made manures, and worked his muck mines, and turned the stable, sty and barn-yard to good account. He brought up a rough farm, worth less than five thousand dollars, to a valuation of fifty thousand. He claimed that it would pay the interest on that, well managed; and that perhaps is the best test of value.

We believe this course—investing in the farm rather than in the bank—is better both for the farmer and for society. It is certainly much safer; for banks fail much more frequently than well managed farms.—The dividends of the latter never fail entirely. The good, substantial living, and the comfortable home are always secure. It makes better society, farming becomes an improving and improvable art, and intelligence is as much a growth of the pursuit as farm products are of the soil. It puts the farmer's capital into his business, where he needs it, and where he can manage it himself. He ventures everything upon his business, lives wholly by it while he lives, and at death hands over a cultivated homestead and a living business to his heirs. This policy glorifies husbandry and hastens the Agricultural Millennium. We look with longing for the dawn of that day.

Stone Fences.

In some regions a stone wall is the cheapest fence that can be made. In many respects, too, it is the best for farm purposes. It has a look of honest stability that is truly pleasing, but is rarely advisable, except where adjoining fields will furnish stones enough to inclose them, and the fields will be greatly improved by their removal. Every wall will tumble down some time or other. On springy soils, draining is indispensable. A trench should be dug a foot or more deep with plow and scraper. Then draw the larger stones for the foundation, and dump them in the trench, which will save much hand-lifting. Afterwards draw the smaller, scattering them along the entire line. Of course, the stones should be laid so as to bind as much as possible, and inclining inwards somewhat. If practicable, find enough flat stones to cover the top of the fence, and help to throw off the rain, and to prevent Jack Frost from tearing it into pieces.

MANGEL-WURTZELS FOR SHEEP.—"Will it pay in Missouri to raise mangels to feed sheep when good hay may be put up for \$2.00 per ton and corn is worth 40 cents per bushel?" No—unless you can feed them off on the ground. If so, yes; for then you will manure your land at the same time for a good crop of corn to follow, or for some other crop perhaps, and so doubly save and doubly gain. You will save the labor of harvesting the crop and of making and hauling out manure; you will gain the clearing of the land of weeds, if the crop is well attended to, and the value of the roots as feed, besides the security of not placing all your dependence for winter fodder on hay and corn, and the introduction of something like a sensible system of rotation, which is a gain all round.

Sweet Potato Culture.

BY W. W. RATHBONE, MARIETTA, OHIO.

The following article gives the method of preparing the land for sweet potatoes; that portion relating to setting the plants and cultivation will be given another month.

The Yellow Nansemond is the only variety worthy of general culture in the Northern and Middle States. Of robust habit, it matures early, and is fit for the table as soon as of sufficient size. Soil is poor that will not produce remunerative crops of eorn and Irish potatoes. Yet I have grown 162½ bushels of Nansemonds per acre, without manure, on a side hill, the same land having failed in corn and Irish potatoes.

SOIL AND PREPARATION.—Sandy and gravelly soils are generally selected, and many think other soils will not answer. I have not a rod of sandy soil, and grow fifteen acres per annum. My soil is mellow, if properly treated—very cloddy, if mismanaged by plowing when wet.

I have produced good crops on red clay land, and raise annually several acres on a yellow loam. Where the soil is poorest, with very hard sub-soil, the Nansemonds grow of a rounded form, while in the richer, deeper and mellow soil they are more elongated. There is many a field laid by as too poor for corn or wheat, or, as many would say, good only for beans, that would produce excellent sweet potatoes, with but a slight dressing of well rotted manure, and leached or unleached ashes. On no other crop does manure tell so plainly. The sweet potato is well adapted to thin soils, especially as it is not an exhaustive crop. I have known it to be raised fifteen years on the same plot of land, showing no diminution of yield. The coating of vines seems to add more to the soil than is extracted by the potatoes. On rich soils too much vine is produced at the expense of the roots.

By saving none but the largest potatoes for planting, I notice a constant increase in the yield per acre. As for fifty years the small and refuse potatoes have been saved for seed, the wonder is that a crop can be raised at all.

A southern aspect is best, yet any other will answer. I always prefer rolling land, and in many years' experience in cultivating side hills, I entirely dissent from the practice almost universally recommended by writers, viz: "Make the ridges run parallel to the hill to avoid washing." It is nonsense to try to dam up the quantity of water that falls in our summer showers.

My experience with the sweet potato proves it best to get rid of all surface water as soon as possible. Therefore, run the ridges from top to bottom of all inclinations, in order that each ditch may carry its own water, and the quantity will never be sufficient to do much damage.

In very light soils, especially if sandy, ridges are by many preferred to hills, but on loamy and clayey soils make hills by all means. I prefer them in all cases, because you are more certain of a good crop; the sun, reaching all sides of the hill, ripens the potatoes sooner; more bushels of large potatoes can be had; and early in the season the large tubers can easily be found, by the bursting of the hills, and grabbed; which, if the operation be done by first cutting the potato loose before pulling, is a positive benefit to those remaining. I have thus passed over a crop three times before digging, and finally taken out large potatoes on the 10th of October that were very small on the 20th of September.

Many who attempt sweet potato growing make great ridges, 2½ or 3 feet broad at the base; and some flatten them on the top, fearing

drought. Better throw away the plants at once than place them in or on such a mass of earth.

NEW MODE OF MAKING RIDGES.—For twelve years I followed the stereotyped plan of throwing two heavy furrows together with a two horse team; it was killing work, and made crooked rows. Eight years ago I invented an easy method, by which ridges can be made as straight as the furrow by a marking out plow. This has been worth much to me, as by it many more hills can be planted per acre, and experienced growers know that the narrow ridges give the greatest product.

From the 1st to the 15th of May, when danger of hard frosts is over, the land, having been plowed, harrowed and rolled, should be ridged.

With two horses and a plow, turning a furrow slice to the right hand, begin on the left hand side of the field, throwing a furrow as the team passes down the hill. Drive back to place of beginning without plowing. Set the clevis over to the extreme left of the beam. The

MANNER OF MAKING RIDGES.

land to be ridged, and the plow is held off to follow, cutting along and taking off part of the first furrow slice, leaving a ridge as you go, never to be over eighteen inches in diameter at the base. When at the foot of the hill, come back, dressing up lightly in the same furrow—i. e., the one last passed down in, letting the near horse walk in the last furrow, and the off horse in the next one to the right. When passing up hill crooked places can be straightened. In the figure 1 and 2 show finished ridges. The nigh horse walks at B, and the off one at A, the perpendicular line shows where the plow is to be set to turn the next ridge.

This mode of making ridges will be valuable to all persons who wish to ridge land in autumn, to expose it to the action of frost or for aeration. I can expose four acres *per diem*, by going entirely round the field—the return furrow would be useless. And more; I can make the ridges sharp, two feet from tip to tip, and therefore more readily permeated by frost and air.

For and Against Dogs.

The affection with which man regards the animals which are dependent upon or attached to him varies greatly, and is nearly in proportion to the affection they show in return. The sheep is more valuable to man than the dog, but the dog returns with the strongest manifestations of affection man's kindness to him, while the sheep barely recognises its owner, and even pet lambs, however fondled, show no love in return, except a love for the food they get. It is not then to be wondered at that man should love the dog, which, of all other animals, exhibits qualities the most loveable. His affection for his master is often such as few friends or even brethren show for each other; his intelligence and docility place him in these respects foremost among brutes; his faithfulness, the offspring of his intelligence and affection, renders him a worthy type of this almost divine virtue. David could use no stronger words than "If He slay me yet will I trust in him," and this is the constant attitude of the meanest cur towards the master to whom he has attached himself. No cruelty will drive him away, no abuse will weaken his love, nor will severity, and all harsh

treatment combined, prevent the exercise of his faithfulness. Taking this view of the relations of the dog to his master, well may he be to man an emplification of the traits, love, joy, long suffering, gentleness, faith, meekness. "Against such," says the Apostle Paul, "there is no law." All dogs do not exhibit those qualities equally, yet all in a considerable degree, and like men, their good behavior and intelligence depend much upon their bringing up. But dogs are enemies to all the world except their masters, their families and friends, so while we all that have opportunity love a dog, we, as a rule, dislike dogs in general. They are dangerous, ugly brutes, cross, apt to bite severely and subject to a distressing malady, which prompts the most peaceable to bite, and which, by their bite, is communicated with fearful certainty to man and other animals, causing inexpressible distress, and, almost certainly, the most terrible of deaths. Dogs are naturally beasts of prey, and no civilization or association with man will destroy their natural instincts to pursue the weaker animals. So they are the natural enemies of sheep, and the statistics of the immense destruction they cause are sufficient to condemn the entire race in an economical point of view, notwithstanding, that when trained from birth, they become such docile and faithful guardians of the flock, defending their charge, even against their own kind, and with their own lives.

Our laws may be too severe to be rigidly enforced, for the people will not sustain them if they aim at the absolute extinction of dogs. While, therefore, we agree very well with "Connecticut," and the hang-dog picture in our last number, we sympathize very fully with him who loves a dog; in fact, there is one animated little piece of dog flesh which would weigh heavily against a great many pounds of mutton in the estimation of the writer. Well has he earned the affection with which he is regarded.

No law could be executed which is too severe, yet the people demand the greatest possible security for their flocks, and against the undue multiplication of dogs, which so greatly enhances the danger from madness—hydrophobia.

The picture on the next page, needs barely a word of comment. Our artist has grouped a number of beautiful designs—chiefly from Sir Edwin Landseer's paintings, with some of his own. They exhibit different traits and phases of canine character and expression, and show the dog in his various relations to man—of servant, guard, play fellow, companion and friend. We are proud to call attention to this picture as a successful effort of both artist and engravers. The central figure is that of the Skye Terrier. The beggar's dog, though a mongrel, is in good part of Scotch Terrier blood; the next, to the right, is the Mastiff—then comes a pair of Smooth Rat-terriers, in a very spirited attitude; next we have one of a group by Jardin, which represents a rough-haired Pointer, common in Europe. The rag and bone pickers' drudge is a common cur, and the scene—dogs working hard at drawing a hand-cart—is common in our cities. Next is a fancy group of a Newfoundland's and two Hound's heads. The two lower corners show a contrast between the life of dogs in humble circles, and in those of wealth and luxury. The one a common cur of bull-dogish aspect; the other the Scotch Greyhound. The dog with a hare we are at a loss to name, it probably represents a cross between the Shepherd and Terrier—said to be a very good cross for hunting singly, if trained. The dog with doves is a portrait; and the group on the right shows a Retriever (with the duck), and a Cocker Spaniel.

Window Gardening.

There is a love of plants so interwoven in the make up of many people, that it will gratify itself under the most adverse surroundings. To those who are blessed with this love—for it is a blessing—no brick and mortar of the city, nor newness of a backwoods dwelling prove any obstacle. As we go about the streets of our large towns, we admire the well kept places, but not the less do we stop to note the humble efforts at horticulture that are made upon window-sills, or upon some favoring roof. What pleasure often grows in a discarded sauce-pan or other domestic utensil, which, having served well in its proper sphere, is glorified by being the home of a balsam or an aster! In making up the Horticultural Annual, we were obliged to omit an article on window gardening, prepared for it by Mr. John Henderson, the well known florist of Flushing, L. I. The article was upon inside and outside window gardens, and we now present his drawing of an outside garden, and make use of some of his material:

"Another mode of having plants and flowers, and for spring and summer the best of all, is to have boxes neatly made of wood to fit on the outside of the window, and then filled with flowering plants, thus making a kind of miniature garden, and at the same time forming an excellent screen. Shades may be dispensed with, as the plants are sufficiently close to prevent persons seeing into

WINDOW GARDEN.

the room, but, at the same time, not preventing those inside from observing through the foliage and flowers everything taking place outside. These boxes can be made quite plain or orna-

mented, and afterwards painted a light green. Stocks, scarlet geraniums, and mignonette succeed well, grown in boxes of this description. The outer edges, next the street, should be planted with the pretty blue lobelia, verbenas,

the general appearance of its leaves and flowers, much like a *Clematis*; indeed it is by some botanists put in that genus, the chief difference being that this has small petals inside the showy calyx, while *Clematis* has none. It is a half

woody vine, growing in good soil, to the height of eight or nine feet. It climbs by the twining of the stalks of its opposite leaves. The flowers are solitary, two to three inches across, and of a purplish color. It is found in shady, rocky places, from Canada to Virginia, and though not particularly common, does not rank as a rare plant. We have seen it growing near New Haven, Conn., and have received fine specimens from a correspondent in Canada, whose address has been mislaid, or we would acknowledge it.—If any of our nurserymen would make a specialty of supplying such of our native plants as are desirable for cultivation, he would find his account in it. Who will take the hint and act upon it?

How the Horseradish is Grown for Marketing.

The method of growing Horseradish as advised by the older works on gardening is quite different from that practiced in the vicinity of New York. Even the

recent French and English works advise the old plan of allowing the roots to remain two and three years before digging them. We have a faster and better way of managing this plant, as will be seen in the following article, prepared for our Horticultural Annual, by Peter Henderson, author of *Gardening for Profit*.

Perhaps there is no vegetable, the cultivation of which is so generally neglected, as that of Horseradish. From the fact that it will grow in almost any soil, and under almost any circumstances, it is for that reason very generally neg-

Fig. 3.—HORSE RADISH MILL.

lected when grown for private use. For the past twenty years it has been quite extensively grown for market purposes in the vicinity of New-York, and there are probably to-day not less than two hundred acres occupied in its cultivation. One grower, alone, on Long Island, grew last season forty acres of this root.

Although, as we have said, it may be grown on any soil, or in any situation, yet, when grown for sale, the best soils are chosen, and the high-

AMERICAN ATRAGENE—(*Atragene Americana*.)

and other trailing plants, which, falling over the sides of the boxes, add much to their effect. The ends of the boxes may be planted with morning glories (*Convolvulus major*), and Canary bird flower (*Tropaeolum peregrinum*), to be trained on wires up and around the windows."

Boxes of this kind are sold by the London dealers ready stocked with plants. They have a great advantage over pots, as they do not dry out so readily, and they can be made much more secure. The edging of the box, shown in the engraving, can be readily made of willow or rattan. Besides the plants mentioned above, almost any of our annual and bedding plants may be grown; water them as often as may be needed, taking care to avoid over watering.

A Native Climber.—(*Atragene Americana*.)

The pleasure we take in illustrating and describing native plants, is somewhat detracted from, by the knowledge that they are, as a general thing, quite difficult to procure. Very few of them are kept in our nurseries, and unless one happens to know their native localities, he has but little chance of obtaining them. The very beautiful native climber that we now notice, is not, as far as we are aware, in the catalogues of any of our nurserymen, though we find it in those of Leroy, and other large European growers. The *Atragene*, though a native plant, seems to be so little known, that it has received no popular name; but its botanical name is a rather pretty one, and there is no reason why it, as in numerous other instances, should not become the common name. As will be seen from the engraving, the plant is in

est degree of cultivation is given it. It is almost always grown as a second crop; that is, it is planted between the spring crop of early beets and cabbages, after they have been sown or planted, in the following manner. The sets, or small roots, are taken from the main root, at the time of digging the crop, and prepared in lengths of from five to seven inches; they are cut as in figure 1, the lower end with a slope, so that it can readily be distinguished at planting. These sets are tied in convenient bundles and kept in boxes of sand, in a cool cellar, or in a

Fig. 1.—HORSERADISH SET.

pit. These are planted between the rows of beets or cabbages, (which are set two feet apart,) at a distance of 15 inches between each plant.

In planting, a hole is made with a light crowbar, and the set of Horseradish dropped in deep enough for its top to be two inches *under* the surface; planted thus deeply, it does not usually grow much, until the crops of beets or cabbages have been marketed; but should the tops grow, so as to interfere with the summer crop, they are hoed off; we have often done this twice in a season, without any injury to the Horseradish crop. The main growth and development of the root being made during the late summer and fall months, the cutting off of the leaves that first start, in a plant of this vigorous nature, is of no injury. There is but little further labor required with it. After cabbages are off, the stumps are dug up, and the plow is run through between the rows of the Horseradish, which soon grows luxuriantly enough to crowd down weeds of any kind. The crop is dug up during the late fall or winter months, and meets a ready sale to those who manufacture it. It is prepared for market by removing the green tops and the

Fig. 2.

small roots, which last are preserved, for next season's planting. The roots are preserved in pits, and when wanted for market are washed and sold by weight. Fig. 2 shows a root as ready for market, much reduced in size. It has thus far been a most profitable crop, and always a safe one, for its hardy nature renders it free from the risk of injury from frost, which attends many other vegetables we cultivate. On the highly cultivated grounds on which it is grown, it yields a large profit—from 12,000 to 15,000 roots are grown on an acre, which

average $\frac{1}{2}$ of a pound each. Prices have ranged, during the past twenty years, from \$100 to \$200 per ton. Even at the minimum rate, it will be seen that it averages from \$500 to \$600 per acre. Those who retail it in our markets, usually supply it in the ground or grated state. They have a mill, or rather a revolving grater, against which the washed and scraped roots are pressed, and rapidly reduced to a condition fit for the table. Figure 3, on preceeding page, shows a common form of the grater, which works by a treadle, and is boxed in. The grater consists of a sheet of tin in which rough holes are punched. A similar machine is used by those who put Horseradish up in bottles with vinegar. We do not know where these mills are sold, but any ingenious mechanic can make a revolving grater, which is all that is required.

Preparing Trees for Removal.

Messrs. Bidwell Brothers, St. Paul, Minn., from whom our readers have had valuable suggestions on other rural subjects, give their method of treating trees that are to be removed from their native localities. While the plan is not altogether new, it is none the less worthy of being followed:

"So common has become the practice of setting out trees resembling bean poles, that the more valuable kinds are in a great measure neglected, and of these few kinds set out as shade trees, nearly half are lost for want of skill in transplanting. By the plan we recommend, the longer lived and slower growing kinds are as readily transplanted as the others, and if followed will result in our having a greater variety of shade and ornamental trees.

"As soon as the frost is out of the ground in the spring, select the trees to be removed, and, if necessary, clear away around them to give them the full benefit of sun and air. In selecting, avoid crotched trees, and all deformed ones. With a fine saw and sharp knife, trim the tree into shape, removing all superfluous or dead limbs, then with a sharp spade dig a circular trench around the tree, of such diameter as to cut off all the leading roots. After the roots have been cut by the spade, smooth the ends with the knife, after which fill up the trench. The tree is to be allowed to remain where it stands until the following fall or spring, when it may be removed. The tree will be found to have made a fine growth of limbs and a mass of fibrous roots, and if transplanted with care to injure neither top nor roots, and mulched after removal, it will well repay the extra trouble."

Notes on Grapes and Grape Culture.

Our estimate of the importance of grape culture may be inferred from the space we give to it. We endeavor to keep the readers of the *Agriculturist* advised as to progress in this branch, and to give them the status of varieties in different parts of the country. To do this involves a great deal of travel, and a careful reading of the reports of the horticultural gatherings that we are unable to attend, besides any amount of "grape talk" with those who visit us. All this is pleasant, but there is another side. There are those, who, if we express a favorable opinion of a variety, seem to think we are unduly favoring the grower or growers thereof, as if we did not know a man from a grape vine. These notes, as well as all other articles, are written solely for the benefit of the readers of the paper, and if any grower of vines or other plants, breeder of animals, or inventor of machines derives any benefit because we think well of an article he has on sale, so much the better for him. We try to make these grape notes without prejudice and without any reference to anything but grapes. We sometimes have made a judgment on specimens from young vines, that we have had cause to modify. In this way we have spoken disparagingly of Roger's Hybrids as a class, but with last year's experience we gladly admit that several of the numbers of which we had fruit, from old vines, give promise of value, and we shall watch them the present year with a great deal of interest. In an article last month we showed the different estimation in which the Concord was held by people residing in the same town, and in almost every meeting of fruit-growers we find a similar conflict of opinion; and not only are certain varie-

ties denounced, but the persons who introduced them, or advocated them, come in for a share of condemnation. The following notes are from Dr. C. J. May, Hancock County, Ill., whose article is too long to allow us to produce it entire. His views of the Concord were given last month:

"The vineyards are mostly on the bluffs, which rise from three to four hundred feet above the river, and extend about four miles back to the prairie. The vineyard region is about thirty miles in length. The exposure most generally chosen is the south, southeast and east, though some are in ground inclining towards the north. There seems to be very little difference in the success, except that those vineyards facing south and east ripen their fruit a few days earlier than those that have a northern exposure.

The Catawba was first planted, and probably nine-tenths of all vines to-day are of that variety. Here the Catawba seems to find all that is necessary for it to produce its best results, the vines constantly bearing crops of fruit and ripening so thoroughly that we are usually able to let the fruit intended for wine remain on the vine six weeks after it is in good condition for market. It is then, of course, so well ripened that its hard acid center nearly disappears, and is in condition to make as good a wine as the Catawba is capable of making under the most favorable conditions. No where in our country does the Catawba reach a higher perfection than here, in no place is it more free from disease, and of course other varieties do equally well.

I have one hundred Delaware vines that bore their second crop the past season, averaging twelve pounds to the vine. They all ripened their wood and fruit perfectly, and there is a prospect of their bearing even a larger crop next season. This is no more than others have done in all parts of our county, wherever good vines have been planted and well cared for. But this is undoubtedly too large a crop per vine for so many vines to the acre as I have planted, though they seem now well able to carry it. Eight pounds per vine will afford enough profit to satisfy the largest desires.

The Delaware is with us a very rapid growing vine, provided good plants are used; comes into bearing early, and sets more fruit than it should be permitted to carry; especially while the vines are young each cane will generally have four bunches, but not more than three should be suffered to remain. Planted four feet apart in rows, and the rows six feet apart, the trellis may be all covered and the vines in full bearing the third season with us, without apparent injury to the vines from haste. If planted at greater distances in the rows, longer time for covering the trellises will be required and more thinning.

The Iona is another variety of which too much cannot be said in its favor. I procured vines of Dr. Grant in the spring of 1864. These vines made a large growth the season of planting, showing no sign of disease—there was not a spot of mildew on any of them. The canes in the fall were cut back to eighteen inches, and the next season (that of '65) all the vines set fruit, and were permitted to carry from four to six clusters each, though I knew so much fruit would impair any variety of grape on vines so young, yet I could not wait. Though this was the season which damaged the Catawba so badly, yet the fruit on these young vines showed not a sign of rot, neither did the foliage mildew; and here I may say neither did the Delaware. The fruit ripened about the first of September, and was of superior quality—the clusters were large and perfect. I this year grew two canes

from as near the ground as possible, and in the fall these canes were cut back to four feet each, the vines were not in the least injured by the following winter, and in the spring of 1866 set a very large number of bunches, many of which I removed. They ripened their fruit August 24th, though they were eatable ten days earlier. There was no disease of any kind about them. And this season there was none on any variety except the Rebecca, which has never failed to mildew badly. The quantity of fruit produced by the Iona was about ten pounds per vine; the quality was superior to all other varieties. A small quantity of expressed juice or must from fruit fairly ripe, and no more, weighed 120°. I know that others have found it to weigh 130° from fruit not more thoroughly ripened than our Catawba grapes usually are when intended for wine. The very best Catawba must I have ever seen weighed 87°. I am satisfied from my own experience that there is no grape now before the people possessing so many good qualities and so few, if any, bad ones as the Iona.

I have fruited the Israella two years, and find it all that has been claimed for it. It is our best early grape, bearing large crops of excellent fruit. It will be the very best early market grape we have. Its beauty, size and goodness will commend it to buyers, while the compact bunch, the berries of which never drop, even when more than ripe, will cause it to become a favorite with those who grow grapes for market. It is in all respects as healthy, hardy and as large a grower and bearer as the Concord.

Starting Sweet Potato Plants.

J. W. C., Lower Pennsneck, Salem County, N. J., who last year grew 170,000 hills of sweet potatoes, gives the readers of the *Agriculturist* his method of raising the plants for setting:

Select a high piece of ground, sheltered from cold winds by a fence or bushes, and dig a pit fifteen inches deep, five feet wide, and two feet in length for each bushel of tubers—ten bushels requiring a trench five feet wide and twenty feet long. Upon the margins of the pit, set on edge boards, six inches wide, and hold them in place by driving stakes inside of the pit, and banking earth against them on the outside. Fill the pit twelve inches deep with coarse hay or cornstalks, or other litter, and dampen it by the use of one pail of water to every three feet in length of the bed. Upon the litter place four inches of good horse manure, level off well and then put on four inches of light sandy soil, and it is ready to receive the seed potatoes.

We differ here in one practice. As to time of planting, some plant immediately, and others wait for the heat to rise in the bed. I prefer to plant the day the bed is made, as there is no delay nor loss of heat in case a cold storm should come. Lay in the whole potatoes as close as may be, without their touching one another, and cover them with light soil about two inches deep. When this is done, the bed will be filled to within two inches of the top of the slats on the edges; now cover the whole with hay, allowing it to be one foot high on the edges, and four feet high in the center. After the bed has been prepared thus it may be left to itself for a few days, but in three to five days it must be examined; make a hole in the hay and thrust in your arm; if the temperature is more than blood heat, leave holes open here and there in the hay. If the heat increases, turn the hay over and air it; and if this does not moderate the heat sufficiently, remove the hay altogether. If

the sun shines hot after the hay has been removed, we put rails across the bed and throw on a little hay, to prevent damage from too great an increase of heat. In eight or ten days after the heat starts, the hay may be left off entirely in the middle of the day, as the plants will need airing, and to be covered up at night. When the nights become warm, the covering is left off entirely. In this neighborhood we make the beds from the first to the middle of April.

Grape Culture and Vine Training.

BY DR. C. J. MAY, WARSAW, ILL.

The following synopsis of vine culture is well put and seasonable, and the method of training is worthy the attention of those who find it necessary to protect their vines during the winter. The caution not to allow the vines to bear too large a crop cannot be too often repeated, as much of the failure of certain varieties is due to over cropping. We know of several large vineyards on their road to ruin from overbearing: *The conditions of success in vine growing are few and simple. First, a situation should be chosen that either needs no artificial draining, or that can be thoroughly drained; the ground for the vineyards should incline enough to run off all surface water, or wet ground will cause the fruit to rot, and the vines to kill in winter. The ground should be prepared to the depth of at least twenty inches; two feet will be found better yet. Good strong healthy vines must be procured for planting. The vines should be staked and tied up, and the laterals pinched out even the first season. The vine should be trained so as to bring the fruit as near the ground as possible, and keep clear of it, the earth reflecting back the heat absorbed during

methods. Any one who will choose a reasonably favorable location, and take interest enough in his vines to try and see how much he can do for them, and yet do all things understandingly, can be successful in grape culture, and can grow such varieties as Delaware and Iona, and also Catawba, where the season is long enough to ripen it, as well as he can grow the Concord. In all cases the vines should be laid down and covered with earth in winter to insure the best results.

The experience of the last fifteen years has at last convinced our vine growers that, by covering their vines in the fall, they are as certain of a large crop of grapes every year as of a crop of corn; for, with the exception of an occasional winter so cold as to injure, and sometimes entirely destroy the fruit buds of the vine, there is, nineteen years out of twenty, no danger to be feared. By covering the vines, even this uncertainty is removed, and it has been found that, even in years when we have no severe cold weather, covering the vines causes them to produce better fruit and more of it, thus paying for the expense of covering, though the winter may have been in all respects most favorable.

That the vines may be covered easily, they should be trained with that purpose in view, although almost any vine may be covered without injury if care is used in bending down the canes. My method of training is the arm and spur system, the only difference being that in place of growing up a single cane, and taking the two arms from it at one foot from the ground, I grow each arm from as near the ground as possible, and train them at an angle up to the first wire, which is one foot from the ground; then along the wire. These arms, when untied from the trellis, readily go to the ground their whole length, and, of course, are easily covered. This is done by one man bend-

Fig. 1.—VINE TRAINED WITH TWO ARMS.

the day, and thus keeping the surrounding air at a more even temperature. The vine grower should be as careful not to let his vines bear too large a crop as to get a good crop from them; and to secure this I know of no better method of training than the double or single arms.

ing down the arms, while another, with a spade, throws on enough earth to hold the arm in its place; then, with a plow, throw a furrow on it from each side, continuing the plowing until all the ground is turned, leaving a dead furrow in the middle between the rows. This is all done

Fig. 2.—VINES TRAINED WITH ONE ARM.

No one who has once thoroughly tried these will train his vines in any other way. These are the most simple and the most easily understood, and less troublesome than any other

very rapidly, two men covering one thousand vines per day ready for the plow, so that covering is, after all, but a small matter, compared with the value of the crop, which is ren-

dered as certain as man can be of anything. There are not probably one thousand bearing vines in our county not covered this winter. I have never seen my method of taking the arms from the ground at an angle up to the first wire, and then along it, recommended in any books on grape culture, or in any of the Agricultural or Horticultural papers; but I have trained over three thousand vines in this way for three years. The accompanying drawings on the preceding page will show it much better than I can in words. Figure 1 represents a vine with two arms, as I would train all vines planted at a greater distance in the row than four feet. Figure 2 shows vines with a single arm, trained as I do my Delawares last planted, four feet apart in the row. To those who think that vines can not be successfully trained by the arm and spur system, I would say, that I can show them a vineyard of about six thousand vines, all trained in this way. Some of them have been in bearing three years, and none have failed to produce good crops each year. I tried upright wires, but have discarded them, and now use three No. 12 wires—the first one foot from the ground, the second fifteen inches above that; to this the shoots are tied as soon as possible; they will then readily go to the upper wire, which is within one or two inches of the top of the posts. My posts are five and a half feet in length, and are set in the ground eighteen inches, so that my trellis is just four feet high. In making my trellis now, I set a post, four inches square, once in every one hundred feet, and two inch white oak stakes, of the same length as the posts, once in twelve feet. These have about twenty inches of their lower ends coated with coal tar; they are driven into the ground eighteen inches, and the wire fastened to them by staples, as to the posts. The first and last posts of a row need to be longer, to be set deeper for bracing when no lath is used at the bottom. The stakes of this size will last as long as the posts, and make equally as good a trellis. As one post will make four of these stakes, it is quite a saving with us, where white oak timber is very costly.

The Judas-tree.—(*Cercis Canadensis*.)

The Judas-tree or Red-bud, as it is sometimes called, is a native tree that should not be overlooked. Its very oddity should commend it, for in early spring, before it unfolds its leaves, it robes itself, trunk and limbs, in a sheet of pink. The small pea-shaped flowers appear in the greatest profusion, in small clusters upon the trunk and limbs, and give the tree a most striking appearance. The rounded leaves come a little later, and the flowers are succeeded by flat, many-seeded pods. The tree is found wild from New York, South and West. The largest specimen we have seen was on the ground now occupied by Central Park. It was as large

and much the shape of a good sized apple tree. The engraving will give a good idea of the size and shape of the flowers and leaves. The European species, *Cercis Siliquastrum*, is sometimes seen in cultivation. It has larger flowers than our own, and according to tradition, is the tree upon which Judas hanged himself—whence

JUDAS-TREE—(*Cercis Canadensis*.)

the common name. The flowers of this have an agreeable acid taste, and in some parts of Europe they are used in salads or made into fritters. The flowers of our own species are also sour, and might be similarly employed. The wood of both species is hard, variegated in color and takes a high polish. The trees are not only ornamental in flower, but their foliage is of a pleasing shade of green. The Japan species, *Cercis Japonica*, is a valuable introduction. It blooms when but a mere shrub, and is completely covered with bright, rose-colored flowers, and is one of our most ornamental early flowering shrubs. It is perfectly hardy in the vicinity New York. All three of the species may be had at any of our larger nurseries, and they are readily propagated by sowing the seeds.

Nut Bearing Trees—Grafting, Etc.

A request for the experience of those who have attempted to graft nut-bearing trees has brought out several letters—some to the effect that all their attempts have failed, while others state that they may be grafted as easily as other

trees. Mr. E. L. Allyn, New London County, Conn., having some Pig-nut seedlings, says:

"I let them grow four or five years, and kept them trimmed as I would apple trees. They were from an inch to an inch and a half in diameter. About the 20th of April I cut the trees close to the ground, except one, which was left about four feet high, and grafted them from the 'Shagbark.' The wood was of the previous year's growth, set in the same manner, and at the same time that I graft my apple trees. My Walnut cions nearly all grew, and most of them very thrifflly. The larger trees bore at four or five years from the graft, the fruit being equal, if not superior, to that of the old tree. These trees are now from 25 to 30 feet high, some 7 or 8 inches in diameter, and have borne nearly half a bushel of fine nuts apiece in a season. The cions were cut at the time they were inserted."

"G. M. C.," Bucks County, Penn., writes us: "There is no more difficulty in grafting chestnuts than cherries; indeed, of the two, I think I have been the most successful with the chestnut. I have trees which I think have not been grafted more than five years, and which have now borne two years. A neighbor has one which bore the second year; these, of course, are very thrifty. Much depends on getting grafts from early bearing trees; but because the trees grow wild in our forests it will not do to set them out and expect them to do well without any further care; they will appreciate a good soil, and good mulching; in many situations, the latter seems indispensable while the trees are small."—"A subscriber," Havre de Grace, Maryland, and W. Marble, Middlesburg, Mass., give similar accounts, of their success with the chestnut. Judging from all these reports,

the conditions of success seem to be the use of young stock, and recently cut cions.

HOW TO HELP THE GROWTH OF EVERGREENS.—We frequently see Evergreens in a languishing condition. If alive, they make no wood, and the bottom limbs show signs of decay. The trouble is frequently in the character of the soil, which is too dry and gravelly. Almost all the evergreens prefer a moist, loamy soil, or even a muck or peat, like that upon the mountains where they grow. The dryness of soil may be entirely relieved by trenching and working in peat or muck. We have seen evergreens making a luxuriant growth upon a pure gravel bed treated in this way. Peat that had been exposed to the atmosphere for one season was thoroughly incorporated with the soil, the ground being covered to the depth of six inches before the trenching began. This is somewhat expensive, but much cheaper than unthrifty trees about the dwelling. The soil should be kept cultivated around all hedges and evergreens several years after planting, and when well established, enrich with old manure.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Home-Made Household Ornaments.

The Cone Bracket, fig. 1, may be made at a trifling expense, by any one of moderate skill and taste. Cut the bracket of any desired shape from pine, or if it can be procured walnut is better, as it needs no staining, and the glue adheres more firmly. If

Fig. 1.—CONE BRACKET.

of pine, stain with powderedumber mixed with a little water. After the two pieces of the bracket are nailed together, a piece of wood two inches square and one inch thick, glued to the center of the lower piece close to the top, gives strength to the bracket, and raises the work in the center. Have a good assortment of cones, acorns, etc., at hand, and dispose them on the frame to suit the fancy; this may be done in a great variety of ways. The engraving shows one, the central figure of

Fig. 2.—BRACKET.

which is a large open pine-cone; at the top and bottom, smaller cones not open; at the sides, butternuts, spruce and hemlock cones, with large and small acorns. The border is made of inverted acorn-cups—a row on the edge of the frame and one on the surface: these must be of uniform size and shape. Now have good hot glue and fasten each piece, beginning at the center. When this is done, let the work dry thoroughly, after which varnish with thin furniture varnish, and it is complete. Fig. 2 shows a bracket to be cut with a narrow saw and penknife. It can all be done with the knife, but the saw makes much more rapid work. It is finer work than that shown in former illustrations, but it requires little skill after the pattern is marked upon the board. This should be of thin stuff, about three-eighths of an inch in thickness, after it is planed down. The shelf is fastened by glue, and by small brads or screws driven in at the back. The support underneath may be put on with glue or with a small brass hinge. A board seven or eight inches wide is sufficiently large for work of this pattern. Pine, white wood, black walnut and butternut are suitable woods for this kind of work. The latter, we think, is quite overlooked as an ornamental wood. It is nearly as dark and handsome in the grain as black walnut, and in many parts of the country much more accessible.

Fig. 3 is a "cornucopia" made of perforated card

Fig. 3.

board. The board is cut square, of any desirable size; six or eight inches will do for lamp lighters or papers. It is worked with bright scarlet worsted, single thread, six holes square, in alternate squares, as shown in figure 3. Beads of suitable size to match are then sewed upon the vacant squares. The inside is lined with tissue paper and the edges bound with ribbon. It is then drawn together in cornucopia shape, sewed up at the edges, and furnished with three bows. It will save labor to slip in an extra lining of tissue paper, which can be removed as often as soiled, and replaced. This is a convenient article for shaving paper, to have near the glass where "my lord" attends his morning toilet. There is nothing like having these little conveniences handy to keep him good natured.

Leaves from the Diary of a Young Housekeeper.—No. III.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

April 3.—When I was looking over Edward's wardrobe I found a great deal of old flannel—some red, some blue, some gray—and a variety of worn out clothing. It will make me just such a rug to lay before my kitchen stove as I have been wishing for all winter. I talked with Jennette about it, and we determined to devote these rainy days, when we can not visit and are not likely to have company, to making the rug. I explained what I wanted to Edward, and he made me some frames, and a hook to work it with out of an old fork. Our grocer gave us a coffee bag, saying that he never sold trifles like that to a regular customer. I ripped it open, hemmed around with strong linen thread and sewed it into the frame. It is about two yards long and one wide. Then Jennie and I displayed our taste in drawing a pattern. As our variety of colors was limited, black predominating, and I intended it only for the kitchen, I could not expatiate in a brilliant cornucopia, such as I made for a parlor rug before I was married. So we decided to make a wide, variegated border into which everything would work, and have the centre-piece three diamonds, filled around with black, (fig. 1.)

We worked the diamonds first, using our most brilliant colors. The rags we cut into strips from a quarter to half an inch wide and pulled from the underside through the foundation, holding the strip in the left hand and the hook in our right. Edward made us some hooks out of two old-fashioned forks, by breaking off the tines and filing down the shank into the shape of an enormous crochet needle. Mrs. Wilson came in while we were at work and was so delighted with the idea of a rug in this style, which she had never seen before, that she is going to have one. She has so many bright colors from the little girls' woolen dresses they have worn and laid aside, that she can make a splendid thing of hers. I told her when she was ready I would bring over my worsted patterns and help her draw the design for the centre.

The hook is of this shape, fig. 2, with the handle on the upper end, of course. When the points of the hook got dull we sharpened them with the file. Jennie and I worked pretty steadily, and in less than a week our rug was done, the surface trimmed off evenly, and laid before the stove. Mother has rugs of this sort that have been in use for ten years, and are still serviceable. It is an excellent plan to make rag carpets out of worn clothing, but I need rugs also to save my carpets.

April 10.—I find I must have another bed for the summer, and have been casting about in my mind to get one up. I know Edward wants to buy ten acres more of land, and so I am unwilling to suggest any unavoidable outlay for family expenses. I asked him if he had any special use for that pile of husks in the corn house. "No," he said, "only to throw into the barn-yard for manure." I told him I thought there were enough to make an excellent mattress, and at an expense of ten yards of ticking we could manufacture an article that would be as good as one costing eight dollars. He assented, and the next rainy day, when he can not plow, we will all go out and make a frolic of picking over

and splitting up the husks. Edward says he can make a mattress needle out of an old umbrella brace, and so our new bed will cost us a trifle over three dollars.

April 15.—Jennette said she would stay a few days longer if I would undertake my house-cleaning. Edward didn't have much done to the old part of the house before we were married, and I have been thinking all winter what a good cleaning that dingy paint and brown ceiling would get as soon as the weather became warm enough. So the other day we began, taking one room at a time, so as not to have any more disorder than we could possibly help. I could leave the dinner getting entirely to Sue, with some instruction, and she was very proud of the trust. Instead of using strong soap suds for cleaning paint, I tried a recipe that I found in an old number of the Genesee Farmer, I believe. Sue went down to the paint shop and got five pounds of Spanish whiting; I had a bucket of warm water, and, squeezing my flannel wash cloth nearly dry, pressed it on to some whiting I had put on an old plate, and rubbed the paint with it; then washed my cloth out and wiped it dry. Jennette followed me with a dry flannel cloth, rubbing the clean paint, which by this process was very easily cleaned, and looked better than any old paint I ever saw cleaned by the common method of soap suds.

April 17.—Edward has been at work around the door all day, and the yard is so much improved!

Fig. 1.—RUG PATTERN.

The wood is all cut and piled in the woodhouse, for he says that, when seasoned under cover, it gives out more heat in burning than when used green, and does not consume so fast. The chips are raked into a large pile, the sleigh and sled stored away for the season, the sap buckets piled away in the woodhouse loft, some of the gate posts that were heaved by the frost have been set upright, and three or four pickets that were off nailed on the front fence. In the garden a place has been spaded for early peas and for onions. On the south shelf of our kitchen window some of my flowers have given way temporarily to boxes of rich dirt, in which we have cabbages just peeping out, and tomatoes an inch high. I mean to have at least fifty plants of grape tomatoes. Mother sent me the seed, and she has preserves made of them which are delicious. They are very prolific, and when ripe have a delicate flavor not found in the other varieties. I brought with me from home some flower seeds, and a few choice cuttings of tea and bouquet roses. They are growing well in pots, but the ground on the north and west sides of the house, where I intend to plant them, is not quite warm enough yet.

April 25.—House cleaning and white-washing all done! And my walls and ceilings look so well! I had a few pounds of Spanish whiting left, which I added to my slaked lime, and put in also a few handfuls of salt and a little dissolved white glue. Edward helped us by doing some of the whitewashing one rainy forenoon, and Jennie and I did the rest inside. I had considerable left, to which I added two handfuls of brown sugar, some more salt, and ochre enough to make a pale straw color, with which Sue has covered the masonry around the caldron in the woodhouse, the back fences and outhouses. She looks upon it as fun, and, after a little instruction in dipping and rapping out her brush, succeeded in doing very good work. The first of May will find the premises inside and out in as perfect condition as to cleanliness as a sanitary inspector could wish.

I must not forget to ask Edward when he goes to Syracuse to get a little sulphuric acid, or some chloride of lime for disinfecting purposes. I asked Mr. Reynolds for some, and he said there was no demand for such strange chemicals in this plain farming community. Then, said I, with a laugh,

Fig. 2.

if you neglect preventives, you will be safe in getting a gross or two of cholera remedies.

April 30.—Jennette was so anxious I should go part way home with her, and visit a friend of ours who lives near the railroad, that Edward consented to spare me two days, and I got back home last night. I never thought Sue White would make such an admirable housekeeper and mother as I found her to be. At school she was one of the most learned and intellectual students in the whole Academy, and quite a literary character. I expected to find her house rather neglected, and her two boys resembling the children of literary people generally. But Sue has consummate sense as well as ability, and she has applied it to the regulation of her household and to the training of her boys, while she still reads a good deal, and frequently contributes to the *Monthlies*.

I never saw more intelligent children. The oldest is not quite seven and the youngest just five. At morning prayers their father opened to the lesson for the day, in *Chronicles* I believe, and asked the boys "what the chapter was about yesterday morning." The youngest boy happened to remember first what it was, and gave a very graphic account of the destruction of the host of Sennacherib. Then the elder added something more about Hezekiah, showing the utmost interest in the Scriptural narrative. I was very much pleased with Mr. White's mode of conducting family devotions. As he read, he put every thing into language the children could understand, and they listened as to an Arabian Nights' tale. Then they all sung a few verses of the boys' selection, and at the conclusion of the devotions all joined in repeating the Lord's prayer. Then the little boys went to their mother for a kiss, the customary reward for good behavior in prayer time. She told me afterward, in speaking of their family training, that they had commenced at Genesis, and had read to that morning's lesson in the same way, explaining everything a child could be made to understand, and requiring from the children an account each morning of the lesson which had been read the previous day.

When Mr. White came in to dinner, the boys gathered round him and said: "Papa, won't you please tell us a story while dinner is getting ready?" "What kind of a story—a bear story?" "No, Papa, a historical story." So he told them in a most graceful and simple style the story of John Smith and Pocahontas. They ran to get the little magnetic globe their mother had earned by a contribution to one of the magazines, to find Virginia, and then the Atlas, as the divisions into States were not marked on the globe. I was equally surprised and delighted to find how much they knew of geography, all taught them from the globe by their mother principally, as Mr. White is away much of the time. Sue said they never told their boys fairy tales or taught them Mother Goose's melodies, but translated into child language the innumerable stories scattered through all the books, Homer stories, Milton stories, geographical stories, Shakespeare stories, historical stories.

My visit was only too short. I found that Sue had carried into housekeeping the same mental activity which characterized her at school—that she was constantly applying the principles of chemistry and physiology which she had learned at the Academy, to every-day life in the kitchen and nursery.

I intend to imitate her example, and, instead of regretting that I can not carry my scientific and literary studies further, endeavor to apply all the knowledge I possess to the duties of daily life.

Leaves from my Journal.—No. III.

PRIZE ESSAY BY MRS. B. MCLELLAN, OF OHIO.

April.—I partly uncovered some of my bulbs to-day. They are crowding their heads out into the world again, but looked so delicate that I hid them away as soon as possible. The air is too chilly; we shall have frost yet. My house-plants have afforded us much pleasure through the long, cold winter; I have no good place for them. At the south window of the sitting-room I make room for a few,

but it is too warm. Roses, geraniums, and some running plants, have grown well. They make the winter sitting-room fragrant and cheery, and are a pleasant reminder of the beauty of summer. By April, one tires of the confinement of house. Somehow, things look faded, and not overnice.

The fresh springing grass, the young willows by the brook, the trailing arbutus with its pink fragrant blossoms looking out from some lingering snowdrift in the woods, seem more beautiful than ever before. But winter clothing must not be recklessly cast off. The ground is damp and cold. Warm weather is not yet here, and nothing is gained by trying to forestall its coming.

While making sponge cake to-day, I thought of the time, now long ago, when I said to a lady friend in my family that I quite despaired of ever being able to make sponge cake. She at once volunteered to teach me I gladly engaged in the process, though with rather a tedious time in prospect. According to her direction it must be stirred "two hours by the clock." The cake would by no means compare favorably with that made and baked to-day in just forty minutes. The rule is so simple, I wish every housekeeper had it. It has been in the *Agriculturist*, but will bear to be published a second time. Six eggs, well beaten together, two cups of sugar, two of flour, two teaspoonfuls cream of tartar, and one of soda, with a little salt. It should bake quickly as possible without burning, being careful to have the oven right when it goes in, instead of making the fire afterwards. It is much nicer to be kept a few days before eating, in the cellar in a stone jar. A "Farmer's Fruit Cake" was noticed in the *Agriculturist* for January, 1865, which I had the curiosity to try. I was surprised, as well as all others who have tasted it, at its excellence. The apple prepared as directed has much the taste of citron, and the whole would pass for rich fruit cake, while it can be eaten without injury. Tarts are very easily made, and filled with nice jelly, are a great ornament to the table, as well as highly relished. A small piece of pie-crust left from pie-making, with which the young housekeeper don't know what in the world to do, will make a plate full. The crust is to be rolled very thin, and baked quickly in patty pans.

I have been ironing shirts and collars. Hannah can't make them look nicely. I rather think she don't care to learn, for I have given her faithful lessons. The gloss and smoothness must be put on while drying, just as in polishing a stove or hoot, and the harder the pressure the better. Muslins, laces and embroideries need working and clapping in the hands until they are very clear from starch, and if ironed when quite damp will look nearly as well as new. It is a good rule to have ironing finished by Wednesday night, as Thursday must be partly occupied with baking.

I was at Lizzie's just after dinner. I found her cleaning the gridiron. It had got sadly burned while she cooked a small piece of steak, and she was scraping it with a knife, while Georgey, in high glee, evidently thought she was at work for his benefit. Is there no way, she inquired, that I can cook a piece of meat, no bigger than the palm of my hand, without such a bother as this? Yes, indeed, I replied. Take that little stew pan, with a long handle, and, putting it over a good fire until it is hot, place the steak in it, covering tightly. Of course it will adhere to it at first, but in a moment or two becomes juicy, when it must be turned, keeping it covered as far as possible. Turn it every half minute, and in three it will be done. Upon putting it into a dish, add butter, pepper and salt, cover still, and by the time you have placed your other dishes upon the table, there will be a sufficiency of gravy; and I question whether Henry could tell that it was not broiled on the gridiron after the former fashion.

I was a long time learning how to roast meat. But once when employing a washerwoman who had formerly been cook in a large boarding establishment, she said to me bluntly: "Why, Mrs. Frisby, you roast your meat to death. It is as tough as leather, and I reckon has not much better taste!" After this, according to her direction, I put the meat into a hot oven at eleven, and it was in readi-

ness for dinner at twelve. The roast is thus quickly browned over and its juices retained. Before, I had cooked it two hours in an oven of only moderate heat. Many and many a time have I thus obtained most useful information from persons whose experience had taught them more than can be learned from books. When first married, I studied my cook-book so constantly that my husband called it my "Library." Though valuable, of course, it often failed to inform me about some little point most essential to success. Salt or fresh meat when boiled is seldom cooked long enough. It should be just ready to drop from the bone when taken up. As it becomes cold, it hardens somewhat. A beef bone, with a little lean meat upon it, will make an excellent soup. Boil very thoroughly, and, removing the bone, add such vegetables as you fancy, chopped finely together. A little rice thrown in, is an improvement. This is a convenient dinner for ironing day. But, Lizzie, I came to take you away from gridirons and dishwater a few days. We have decided upon a few improvements at home, and shall be "topsy turvy" a while. I want a little visit from you first—I shall take Georgy in his wagon with me, and you may follow at your leisure. Go round by the store and tell Henry as much.

How Women Can Help Us,

And at the same time help themselves. There are multitudes of ladies among our readers who are longing for "something to do," and are willing to do it. They have heard of woman's rights possibly, and of the enlargement of her sphere of usefulness. We should like to accomplish this latter, and our own, at the same time. We are aiming at a reformatory work, on the farm and in the household. We seek to lighten woman's burdens in every home we enter, and to cheer her in every department of her toils. And we have abundant evidence, in the kindly appreciation of the *Agriculturist* in the families where it is read, that we are successful in this work. Every such family can pursue its labors more intelligently and profitably. There is an atmosphere of cheerfulness and thrift in these homes, that we do not find where no paper is taken. Now we want to enter the millions of homes of cultivators where no agricultural paper is read, and introduce this new atmosphere. We want to teach better methods of husbandry and housekeeping, and to make the whole family, men, women, and children, better and happier in their home duties and toils.

In this matter the ladies can help us as others can not. Many of them have the leisure and special adaptation to the work, and we offer large premiums in useful articles as a reward. If they would take a subscription paper and go around among their friends and acquaintances and ask them to subscribe, they would get well paid for their trouble, and enlarge our field of usefulness. We greatly desire to have a hearing in every one of the five millions of homes that are sustained by the products of the farm and garden. We have a good deal to say that will aid production, and digestion. Will the ladies help us?

Lime Soap.—The substance that forms in flocculent masses in hard water when soap is used in it, is lime soap, which is insoluble in water. An acquaintance tried to remove some mortar spots from his clothes by rubbing soap upon them; the result was the gumming up of his clothes with lime soap, which no washing would remove, and no fluid that he could apply would dissolve. We recommend him to soak the spots in vinegar, or some other dilute acid. This will decompose the soap, leaving a lime salt, to be washed out, and the grease remaining in the cloth. Then he can remove the grease with benzine, or in any other way. The acid may discharge the color of the garment, for some delicate colors are affected at once by acid, but many colors will not be changed. Where hard water is continuously used for washing, the fabrics become harsh and disagreeable from this lime-soap. The use of soda will in a good measure prevent its formation.

BOYS & GIRLS' COLUMNS.

The Doctor Talks to the Boys and Girls.

When you read about the tricks of magicians, who show a human head floating in the air, and who take out of a man's hat articles enough to fill a hand-cart, your young eyes open wide with astonishment. These things are indeed wonderful as showing what ingenuity can do, but they are only tricks, and a person as ingenious as the one who invented them can easily find out how they are done. Right around you are things more wonderful than any thing the conjuror can show, and if you will only open your eyes at this, and learn how to use them, you need not regret that you can not see the magician display his skill. Some of the things that I shall talk to you about have been carefully watched by the most learned men, who have told us very plainly what they have seen in egg and seed, in bird and flower; but how the seed becomes a plant or the egg brings forth a living animal—these have never been found out.

Wise heads—philosophers as they are often called—are not, as many suppose, always engaged in looking at the stars, and measuring mountains; many of the most learned poke around mud holes and ponds and find animals and other objects for their study; many think that curious things are only to be found by travelers in distant countries—but you need not go out of your own neighborhood nor off of your own farm to search for curious objects, or to see more wonders than all the showmen can display.

Every boy and girl in the country knows frog-spawn. It is a mass of clear jelly, to be found in early spring in almost every pool of water. If you can find some of this frog-spawn—and you can readily do so by a little search—take home a little of it and place it in a saucer or bowl of rain water, and look carefully at it. It is a mass of clear jelly, with some dark spots distributed

through it. It is really a collection of transparent eggs surrounded and held together by a jelly-like substance, and the spots are the yolks of the eggs (fig. 1). Keep the vessel containing the spawn and water in a warm window, and look at it carefully every day and change the water every day or two. The round spots, or yolks, soon cease to be round, and will have this outline, fig. 2, and later like this, fig. 3; but unless one has a microscope and knows how to use it, all the minute changes that take place can not be followed.

Still a great change may be seen without any help but your own eyes. The spots will rapidly increase in size, and you will soon see them of the shape of fig. 4, and you will be able to make out that the little animal has a head and a tail. Which is the head, is made more certain by the appearance of eyes, and the tail shows its character by having a tendency to wiggle, and growing longer. Fig. 5 shows an older and larger animal than fig. 4, and as the little fellow has been growing all the while, you will wonder what he has fed on. The transparent jelly of the egg has thus far contributed to his growth, but he has done no feeding proper, as he has no mouth. As a month is the next thing needed, a little opening appears in the head, and the internal arrangements of the animal having been completed, he jerks himself out of the cavity of the egg that has heretofore been his prison, and when strong enough goes forth to see the little world you have made for him in a bowl. The figures given herewith are all more or less larger than the natural size.

But, you will say, this is not a frog, it is only a tadpole or pollywog. True, but is it not a wonderful change. A mass of jelly into living animals; and is it not also curious that the frog is not born a frog, but that he is at first an animal quite unlike a frog. It is equally interesting to watch the change of the tadpole on his way to frog-hood, but we can not do so now. Put some of the tadpoles where they can take care of themselves, and keep a few to study. They will do best in a glass jar, in which you must change the water every day or two. Any fruit-can will do, and you can avoid the trouble of changing the

water by putting in some plants. Place an inch or so of gravel in the bottom of the jar, and then place in it any of the plants that are found growing entirely under water. Every deep brook or pond will furnish a number of these, and it does not make much difference which is taken, only those with the finest leaves are the best. Tie the plants to a bit of stone to hold them down, fill the jar

with rain or river water, and put in the tadpoles. If this is kept in full light, the water will not need changing.

A New and Useful Toy.

One of the best toys for children we have ever seen is a set of improved builders' blocks, invented and patented by a subscriber to the *Agriculturist*, Mr. Charles M. Crandall, Montrose, Pa. They are so really pleasing and useful, that we publish an engraving, showing how they work. They are plain bass-wood pieces, most of them of the shape shown in the figure, notched to fit each other firmly, so that when a building is put together it can be taken up whole and moved about without falling to pieces. They can be joined in almost endless combinations. We have seen churches, factories, wind-mills, fences, cradles, and other furniture made with them. The little house shown in the picture was put up by a boy in a few minutes. Besides the many hours' amusement they will afford, playing with these blocks will develop skill and taste in planning and executing, and we think Mr. Crandall has done the children a real service in bringing out so capital a plaything. The blocks are very durable, but if any split, they are still serviceable in making new designs. All information about prices, etc., can be had by addressing the inventor.

Plant Something,

a grape-vine, strawberry plant, a rose-bush, or even a beet or a carrot—something to care for and watch and study day by day. It will give more pleasure than any toy, besides adding something to your knowledge. It may perhaps be the beginning of a successful career as a fruit grower, a gardener, or a botanist.

The Boy who kept "Blowing."

Those who read the story of Timid Timothy in the March *Agriculturist*, page 107, will readily see the meaning of the similar picture given here. Boys who brag or

water by putting in some plants. Place an inch or so of gravel in the bottom of the jar, and then place in it any of the plants that are found growing entirely under water. Every deep brook or pond will furnish a number of these, and it does not make much difference which is taken, only those with the finest leaves are the best. Tie the plants to a bit of stone to hold them down, fill the jar

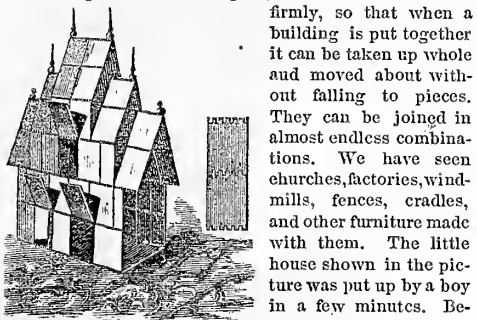

Fig. 6.

with rain or river water, and put in the tadpoles. If this is kept in full light, the water will not need changing.

a grape-vine, strawberry plant, a rose-bush, or even a beet or a carrot—something to care for and watch and study day by day. It will give more pleasure than any toy, besides adding something to your knowledge. It may perhaps be the beginning of a successful career as a fruit grower, a gardener, or a botanist.

The Boy who kept "Blowing."

Those who read the story of Timid Timothy in the March *Agriculturist*, page 107, will readily see the meaning of the similar picture given here. Boys who brag or

"blow" a great deal may here see themselves as others see them, on the way to become mere porpoises in society, amusing perhaps to those about them, but not counted as valuable fish. "Let another praise thee and not thyself."

New Puzzles to be Answered.

No. 253. *A Clock Problem*, suggested by David Rue, Jr.—Suppose the striking part of a clock to be out of order so that at one o'clock it strikes three, at the next hour it strikes five, thus gaining two strokes each hour, in how many hours from one o'clock will it strike the time correctly, and how many strokes will it have given in all, counting the three made at the beginning? Of course it never strikes more strokes than twelve at one time.

No. 259. *Illustrated Rebus*.—A very obvious truth.

No. 260. *Mathematical Problem*, by J. S. Chandler.—Two wheels, one four (4) feet and the other four feet and one inch (4 feet 1 inch) in diameter, were put on an axle-tree, which brought them just four (4) feet apart; both were then started at the same rate of speed, but as one wheel was larger than the other, they soon came back to the point from which they started, describing a perfect circle in their course. What was the diameter of the smaller and what the diameter of the larger circle?

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the March number, page 107. No. 253. *Illustrated Rebus*.—The last rose of summer....No. 254. *Illustrated Rebus*.—The proper study of mankind is man....No. 255. *Word Square*.—The proper definitions are: Plea, leap, case, apes....No. 256. *Illustrated Rebus*.—To the wise, nothing is accidental....No. 257. *Anagrams*.—1, Afterward; 2, Mourned; 3, Prepared; 4, Hypocrisy; 5, Astonished.

The following have sent in correct answers, up to March 1st. R. L. Wells, C. H. Cannon, Oliver Coombs,

Willie Leshar, George Kemper, "J. G. S.," Chas. E. McLenegan, E. Van Syckel, Jr., A. A. Boyden, Charles A. Farmer, "H.," Wm. A. Fulton, A. J. Walling, James and Libbie Bartlett, Owen E. Brumbaugh, Irvin Clark.

[COPYRIGHT SECURED.]

GREAT EXCITEMENT IN THE MONKEY FAMILY.—Drawn and Engraved for the American Agriculturist.

In the *Agriculturist* for May, 1866 (page 193), we gave an amusing picture representing an honest dog and a thievish monkey left near the dinner table after the family had finished their meal. It gave the monkey a bad reputation, and, according to our artist's account, several members of the monkey family have had a serious talk about it. You may see in the picture that the dog-nosed ape is examining the *Agriculturist* and studying the picture with much interest. He thinks there may be some truth in it, but is sure it does not mean *him*, for he gives a sidewise look at his neighbor, who is chattering away very angrily, having discovered his own portrait. If he could speak, he would no doubt give us as harsh a scolding as many a man has done when his character has been shown up among the humbugs. But we will not be too severe upon the poor monkey, by comparing him with some of the knavish swindlers who have been exposed.

"I Wasn't Watching."

A little girl went with a friend into a book-binery. She was much pleased to see how the titles and pictures in gilt were put upon the backs and sides of the covers; and for some time she watched the man who was doing this work, thrusting the covers one by one under the press, with the gold leaf upon them. But at length she noticed that a part of three of this man's fingers was gone. Her sympathy was excited and she whispered a request that her friend would ask how the accident happened. "I was at work here at the press," was the reply, "and not attending to what I was about I got my fingers under the press and it crushed them. *I wasn't watching*, and I shall have to carry this mark to remember it as long as I live."

I'll tell you what I thought when the little girl told me the story: There are many things that boys and girls are tempted to say and do, and that they will say and do if they are not on the watch. They are things that always make a wound that leaves a scar,—not on the outside; not where you can see it,—but on the heart. When a boy uses a profane or obscene word; when he does an act that he would blush to have known at home; when a girl says or does any of those things which none of you need be told are only *bad*, then scars upon the heart are being made that will sooner or later cause bitter sorrow. "I wasn't watching" will have to be said about them. Try not to get these scars upon your hearts. There is one strong and willing Friend, you know, who is always ready to help you.

UNCLE PAUL.

A Home-loving Cat.

A lady correspondent sends to the *Agriculturist* the following, which she says is true: "Father R. had a favorite cat which he took with him when he removed from the house which he had long occupied to another, half a mile away, across a river. A few days after the river became greatly swollen by the spring freshets, and the bridge was swept away. Kitty evidently did not like the change. All the coaxing and petting she received failed to reconcile her to the new home. She disappeared, and what was her master's surprise, on crossing the swollen stream in a boat, to find kitty at the old house. He carried her back with him, and the second time she was gone and re-appeared at the deserted home. There she remained for a year alone, greeting members of the family on their occasional visits with great affection. At the

end of the year the family returned there to live, to the great apparent satisfaction of the faithful old sentinel."

A Novel Bird Catcher.

Effic Johnson contributes the following to the *Agriculturist*: "One of our friends, a neighbor living a short distance from us, had a beautiful bird—a pet canary. One of the seed ceps of its cage accidentally getting turned one day, the bird escaped to the woods, only a few yards from the house. Toward evening Mrs. W. and her husband walked out toward the woods, talking of the lost bird, and wishing it would come home again. The house dog, a large, noble looking animal, walked by their side, looking up into their faces as if he understood all they were saying, then suddenly started off, and in a few moments returned and laid the bird at their feet. Mrs. W. screamed out thinking her pet was dead, and the frightened bird flew away again. The dog started after it, and the second time caught it and brought it to his mistress. He held it carefully inside his lower jaw, and did not injure it at all; but when Mrs. W. took it in her hand it lay motionless from fright for a moment. She placed it in its cage, and soon it was hopping about, with ruffled feathers, it is true, but as well and sprightly as ever. Whenever Mr. or Mrs. W. told the story the dog would look up, wagging his tail with an extremely satisfied air, as much as to say 'Wasn't that pretty well done for a dog?'"

How to "Finish" a Boy.—Give him plenty of money, nothing to do, let him choose his own playmates, spend his evenings where he pleases, come home when he gets ready, and he will very soon finish himself.

For Families and Manufacturers.

**These World-Renowned Sewing
Machines**

Were awarded the highest premium at the World's Fair in London, and six first premiums at the N. Y. State Fair of 1866.

These machines are made under the immediate supervision of the President of the Company, ELIAS HOWE, Jr., the original inventor of the Sewing Machine.

The Stitch invented by MR. HOWE, and made on this Machine, is the most popular and durable, and all Sewing Machines are subject to the principle invented by him.

SEND FOR CIRCULAR.

Justly celebrated for perfect simplicity, great strength, and immense compressing power; is GUARANTEED with eight men and two horses, to self-temper the clay and make 3,000 to 3,500 elegant bricks per hour. J. H. RENICK, Proprietor, No. 71 Broadway, New York, Room 23.

HUDSON RIVER INSTITUTE, at Claverack, Columbia County, New York.—Eighteen Instructors; Eight Departments. \$300 a year. No Extras (except Piano Music). Term opens April 15. Lewis' Gymnastics for Ladies; Military Drill for Gents. Every facility for the very best Christian Education.
REV. ALONZO FLACK, A. M., Principal.

The Herald of Health.

The March Number contains:

Length of Days,
(By REV. H. W. BELLOWES.)

The Value of Fruit as Food,
(By F. R. ELLIOTT.)

Letters to Ladies,
(By MRS. R. B. GLEASON, M. D.)

Vitality, Its Phenomena,
(By GEO. F. TAYLOR, M. D.)

Weak Lungs and How to Make Them Strong.

No other Magazine attempts to popularize the Science of Physiology and make it Applicable to PHYSICAL AND MENTAL IMPROVEMENT. If it is important to understand Politics, Agriculture, Science, how much more to know ourselves.

Articles in the January No. on

"Human Development,"
(By HENRY WARD BEECHER.)

"The Sacredness of the Body."
(By REV. O. B. FROTHINGHAM.)

"How to Train up a Child."

The February No. contains:

Sources of Muscular Power,
(By PROF. R. KING BROWNE.)

Buildings for the Poor,
(By HORACE GREELEY.)

Body and Brain.

How to Bathe.

Memory, and How to Improve It.

The April Number is larger, richer and better than any preceding one. Prof. Rufus King Browne commences in it an illustrated Series of Papers on the **Physiological Anatomy and Physiology of Man**, derived from his extensive Microscopic investigations.

Henry Ward Beecher furnishes a discourse, preached by request, to **Medical Students**. It is one of great power, and should be read by every man and woman.

Moses Coit Tyler commences a Series of Papers called

The Brawnville Athletic Club.

Nothing before published on Health Topics is so fascinating. Besides these, the April Number contains a long list of articles on Health, and all subjects relating to Human Welfare. See February *Agriculturist*, page 72, for Prospectus, etc.

(From the Country Gentleman.)

"The Herald of Health" is a Monthly, very carefully edited, and with a very able corps of contributors. We call attention to it, with the conviction that its extended circulation would be a source of great benefit to the country at large, as well as to individuals.

2.00 a Year. 20 Cents a Number.

For 30 subscribers and \$60.00 we give for a premium **Wheeler & Wilson's Sewing Machine**, worth \$55.

For Ten Subscribers and \$20, each Subscriber shall receive, post-paid, a handsome Steel Engraving of "**LINCOLN AT HOME**," 19x21 inches, and worth One Dollar.

Address **MILLER, WOOD & CO.,**
15 Light-street, New York City.

THE LITTLE CORPORAL

Is acknowledged by the leading papers to be the **Best Juvenile Paper in America.**

The American Phenological Journal, of New York, says: "The Little Corporal."—Mr. Sewell's Western Juvenile surpasses, both in real merit and in circulation, any similar attempt, East or West. His success excites the cupidity of others, and we now have a swarm of juvenile journals launched on the uncertain sea of experiment. While we wish well to all good endeavors, we must award the credit to *The Little Corporal* of leading the van."

We offer a **MAGNIFICENT LIST of PREMIUMS!** The price of the Corporal is one dollar a year. In advance; sample copy, telling all about the premiums, ten cents. Address ALFRED L. SEWELL, Publisher, Chicago, Ill.

Book Agents Wanted.

To solicit orders, in each town in the United States and Canada, for the most popular subscription book ever published, being *THE ILLUSTRATED HISTORY OF THE BIBLE*, by John Kitto, D. D., F. R. S., Edited by Rev. Alban Bonar, D. D., of Norwich, Conn.—Over 700 closely printed Royal Octavo pages—more than 100 full page engravings. Recommended by the leading Clergy of all denominations of Christians. 53,000 Copies already printed. Six large power presses running on the work. Everybody wants it. Experienced Agents say they never knew a book sell so well. No competition. Experienced Agents, School Teachers, Sabbath School Teachers, retired Clergy, men, and others, are wanted to introduce this great work into every household in the land. For Circulars, etc., apply immediately to the Publisher, HENRY BILL, Norwich, Conn.

RURAL IMPROVEMENTS.

ROBERT MORRIS COPELAND, Author of Country Life, furnishes plans, &c., for all kinds of Rural Improvements. Refers to John M. Faber, Nathaniel Thayer, Boston; Francis G. Shaw, New York; Rufus Waterman, Providence, R. I. Office, 41 Banister's Hall, Boston.

Pronounced by the Judge at the
GREAT NATIONAL FIELD TRIAL
at Auburn, in July last, to be superior to all others in
Every Desirable Point.

69 Murray-street, New York.

ROSES.

We offer very fine plants of the best sorts, such as have been found to succeed in our climate, at

\$20 per 100; \$150 per 1000.

They are on their own roots, and embrace the different classes, but are largely composed of Hybrid Perpetuals. For Catalogues, address

PARSONS & CO., Flushing, N. Y.

THE GREAT AMERICAN TEA COMPANY,

Since their organization, have created a new era in the Tea Trade. They have introduced their selection of Teas and Coffees, and have sold them at the smallest profits possible. They warrant all the goods they sell to be perfectly satisfactory. If they do not prove so, the purchaser has the privilege of returning them within 30 days at the expense of the Company, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of Clubs. They are sold at Cargo Prices, the same as the Company sell them in New-York, as the list of prices will show.

PRICE LIST:

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 1/2 lb.
GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 1/2 lb.
MIXED, 70c., 80c., 90c., best \$1 1/2 lb.
JAPAN, \$1, \$1.10, best \$1.25 1/2 lb.
OOLONG (Black), 70c., 80c., 90c., best \$1 1/2 lb.
IMPERIAL (Green), best \$1.25 1/2 lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.30 1/2 lb.
GUNPOWDER (Green), \$1.25, best \$1.50.

COFFEE DEPARTMENT.

Our Coffee Department is very extensive—the largest, perhaps, in the country. We run three engines constantly, and sometimes four or five in roasting and grinding our Coffee. Our Coffee buyers are experts, who examine most of the Coffees imported, and select the best and finest flavors for our trade. We employ the most experienced and skillful roasters, who exercise the greatest care that it shall be cooked in a perfect manner. It is always fresh, for our orders crowd our facilities to their utmost capacity. A considerable portion of the Coffee put upon the market of late years is picked while the pods are green, and subjected to artificial heat to open the pods. This is not so good as that which ripens in the natural way upon the plant. Our Coffee buyer thoroughly understands this business, and can readily distinguish the naturally ripened from the artificially cured; and he only buys the Coffee which is naturally ripened. We examine the cargoes as soon as they arrive, and our trade is so large that it requires all the finest lots. This is what gives our Coffee a superior flavor to many others, and the same flavor it used to have in days long gone by. It is a common saying that most Coffee does not taste as well as it formerly did. The reason for it is, that a considerable portion of it is picked before it is fully ripe. We sell none but the fully ripe, rich flavored Coffee.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of

THE GREAT AMERICAN TEA COMPANY.

Nos. 31 and 33 VESEY-ST.
No. 640 BROADWAY, corner of Bleecker-st.
No. 461 EIGHTH-AVE., north corner of Thirty-fourth-st.
No. 299 SPRING-ST.
No. 205 FULTON-ST., BROOKLYN, corner of Concord-st.
No. 133 GRAND-ST., WILLIAMSBURGH.

COUNTRY CLUBS, Hand and Wagon Pedlars, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled, and in case of Clubs can have each party's name marked on their package and directed by sending their orders to Nos. 31 and 33 Vesey-st.

Our friends are getting up Clubs in most towns throughout the country, and for which we feel very grateful. Some of our Clubs send orders weekly, and some not so often; while others keep a standing order to be supplied with a given quantity each week, or stated periods. And in all cases (where sufficient time has elapsed) Clubs have repeated their orders.

Parties sending Club or other orders for less than \$30 had better send Post-Office drafts, or money with their orders, to save the expense of collecting by express; but larger orders we will forward by express, to collect on delivery.

We return thanks to parties who have taken an interest in getting up Clubs; and when any of them come to New-York we shall be happy to have them call upon us and make themselves known.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs of less than \$30.

N. B.—All villages and towns where a large number reside by clubbing together can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY-ST
Post-Office Box, No. 5,643, New-York City.

GETTING UP CLUBS.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

We publish some of our Club Lists to show how it is done and as matter of reference.

After the first Club we send blanks.

Direct your orders plainly, THE GREAT AMERICAN TEA COMPANY, Nos. 31 and 33 Vesey-st., Post Office Box, 5,643—as some parties initiate our name as near as they dare do.

From The Great American Tea Company's Advocate.

A Word with Our Customers.

We have no doubt that our customers, scattered throughout the length and breadth of the land, as they are, embracing every State in the Union, except those on the Pacific shores, will be interested to learn how we have succeeded in our great enterprise of furnishing Teas and Coffees, to all, at the smallest possible profits. To afford them this information we propose to give a few facts connected with our business.

Years ago, in the early stage of our enterprise, we based our calculations and graded our rates of profit upon the basis of a trade of \$100,000 per week. This amount we expected to reach by enterprise and fair dealing. We well knew that it could be accomplished only by filling every order promptly, and to the letter; and at uniform prices. These principles we have adhered to strictly, and have carried out the ONE PRICE SYSTEM in all our transactions.

After years of anxiety and incessant toil, we are enabled to say, without boasting, that our standard of sales, which we erected years ago, has been reached. The *New York Tribune*, in an editorial published in their paper several months ago, placed the amount of our sales at that time at \$90,000 per week. Our business increases regularly and constantly, and never faster than at the present time. We therefore look confidently forward to a large increase during the present year, over and above the average of \$100,000 per week. At the present time our sales are fully equal to 2,000 chests per week, which is equal to about one-fifth of all the Teas imported into this country. This we consider a great success for a specialty—probably the greatest ever achieved in this country, in any similar mercantile enterprise.

With our increased trade we increase our facilities, so that all our orders will be filled as promptly and correctly as heretofore, and perhaps more so, because our system becomes more and more perfect with time and practice.

We employ at least two hundred persons constantly, and by our perfect system of division of labor into departments, we make a great saving of expense, of which we give consumers the benefit, by furnishing them with the great necessities of life—TEAS AND COFFEES—at the unprecedented low figures which we publish in our Price List in another column.

While we feel sure that we have given, and as we shall continue to give, our customers the fullest and amplest return for their money, we thank them, one and all, for their patronage.

COMPLIMENTARY LETTERS.

In order to give our friends in the country an idea of the magnitude of our business, we publish the following letters which we have received from two of the principal Express Companies of this country, and from other sources. The facts which they state show conclusively that no other Tea House in this city or country can compare with us in magnitude of business.

UNITED STATES EXPRESS OFFICE, No. 82 BROADWAY,
New-York, Jan. 1, 1867.

To the Great American Tea Company:

GENTLEMEN: Accept the compliments of the season. We thank you for the patronage we have received from your houses.

Perhaps you would be gratified to learn that we have expressed more goods from your Company during the past year than from any other Tea or Grocery House in this city during the same time.

We solicit a continuance of your patronage, and pledge ourselves to give your goods dispatch, careful attention, and we will do so at the very lowest rates. Yours, &c.,
C. P. THAYER, General Agent.

OFFICE OF THE AMERICAN EXPRESS COMPANY,
Nos. 123 and 124 Broadway, cor. Cedar-st.,
New-York, January 10, 1867.

To the Great American Tea Company, Nos. 31 & 33 Vesey-st.:
GENTLEMEN: We are pleased to acknowledge our indebtedness to you for the liberal patronage we have received at your hands during the last year.

We consider your business of as much importance to us as that of any other house in the city, and shall be happy in the future, as we have been in the past, to receive your commissions, hoping that by dealing out "safety and dispatch" we will merit them.

With many thanks for past favors, we wish you, gentlemen, "A Happy New-Year."
Yours respectfully,
JAS. C. FARGO, Manager.

NEW-YORK, Jan. 5, 1867.

To the Great American Tea Co.:

GENTLEMEN: I am happy to say that your orders for packing boxes have increased more than two hundred per cent. within the past year. I am now manufacturing more boxes for you than for any other concern, although I am supplying the largest manufacturing establishments in this city.

Hoping to receive a continuance of your patronage, I am, Respectfully yours,
J. H. SWIFT,

Packing Box Manufacturer,
Nos. 92, 94, 96, 98, and 100 Norfolk-st., New-York City.
PAPER WAREHOUSE, No. 29 BEERMAN-ST.,
New-York, Dec. 21, 1866.

The Great American Tea Co.:

GENTLEMEN: We can send you but four hundred thousand paper bags to-day, and will endeavor to give you seven hundred thousand more before the 31st. After the 1st of January we shall increase our production so as to meet your large orders more promptly.

Respectfully yours,
WILLIAM H. AMES & CO.

Complimentary Letters from Clubs.

TOLEDO, Ohio, Jan. 12, 1867.

Great American Tea Company, Nos. 31 and 33 Vesey-st., N. Y.

GENTLEMEN: The two boxes of Tea I ordered from you were received yesterday by M. U. Express Co., and have been delivered to the subscribers. I was much pleased with the manner in which you put up the packages with the subscriber's name on each. I would say that the quality of your Tea is superior, giving entire satisfaction. "Some of the club" say that it is the finest flavored Tea they have ever tasted. Your Company deserve credit for their perseverance in overcoming the difficulties incurred in establishing such a trade, and in breaking down the monopolies that have so long kept the consumer paying such high prices. With thanks for the complimentary package, I am most truly yours,
DAVID CARLUTHERS.

NEW-HAVEN, Dec. 14, 1866.

To the Great American Tea Company:

SIR: This will convince you that your goods have given perfect satisfaction, as I have added somewhat to the Club. Please accept our especial thanks for the complimentary package, also for the nice manner in which the whole was put up. Yours truly,
Mrs. L. BLOSS.

Please return as soon as convenient. Direct as before to Justin Bloss, New-Haven, Vermont.

CLUB ORDERS.

LAKE PLEASANT, Erie Co., Pa., Jan. 12, 1867.

Great American Tea Company, Nos. 31 & 33 Vesey-st., N. Y.

GENTLEMEN: The Tea you sent me last month arrived safely and in good order, and gives good satisfaction. Please send the within order, the sixth I have sent within less than a year. The first order I sent last Spring was an experiment, to see if good tea could be sold at retail in New-York for the low price of \$1.25 per pound. We found the Tea to be of good quality, and since then we have continued to send to you for our Tea, and shall do so as long as you do as well by us as you have in the past.

Yours truly,

W. E. WILLIAMS.

CRANBERRY TRACT, (part in bearing,) near N. Y., for sale cheap. Address H. D. Beach, Toms River, N.J.

[Just Published.]

New Edition Revised and Enlarged. WELLS' EVERY MAN HIS OWN LAWYER and Business Form Book.

A complete Guide in all matters of Law, and Business Negotiations, for every State in the Union.
With Legal Forms, and full Instructions for Proceeding, without Legal assistance, in Suits and Business transactions of every description.

Together with the different State Laws, concerning the Collection of Debts, Property exempt from Execution, Lien Laws, Usury, License to Sell Goods, Qualification of Voters, Limitation of Actions, &c.

Also, the General Bankrupt Law, with Forms and full Instructions to enable the insolvent debtor to take full benefit of the Act without legal assistance.

Also, Pension Laws, with full instructions and forms to enable the Discharged Soldier and Sailor to procure Back Pay, Pensions, Bounties and all war claims.

Also, Patent Laws, with full instructions to inventors.

Also, Excise Laws, Stamp Duties, Post Office and Custom-House Regulations, the whole action of the Government in relation to Reconstruction, and the Freedmen, Constitution of the United States, with Amendments, State Seats, with descriptions, &c.

This work, prepared some years ago, was received with great favor by the public, attaining a larger sale, it is believed, than any work of the kind ever published. Lapse of time has brought material changes in the statutes of many of the States, the War has not only altered the social condition of some of them, but has introduced the Internal Revenue System, National Banks, new Post-Office and Custom-House Regulations, Amendments to the Constitution of the United States, Emancipation of Slaves, General Bankrupt Law, &c.

The subject of Pensions, Bounties and War Claims, has also assumed a new and greatly increased importance.

These numerous changes have led the publisher to make a new and thoroughly revised edition, reproducing the whole work, with special reference to making the work complete and reliable, without regard to expense. So critical and thorough has been the revision, that the most implicit reliance can be placed upon the work, as authority on all the subjects of which it treats.

Over two hundred and fifty pages new matter have been added to meet the requirements of the times.

The utility of such a work, no one will question. The sale of hundreds of thousands of copies of the former editions, and the constant demand for it have settled that point. The professional man, the farmer, the mechanic, the manufacturer, the soldier, can require a convenient, comprehensive and reliable work which will enable him to draw up any instrument in writing that may be required, in a legal form, which will furnish such legal information as is called for in the various avocations of life, a book that everybody can understand, and that will enable every man or woman to be his or her own lawyer.

There is no class of the community, male or female, who have, or expect to have, any property, or who have any rights or privileges which require protection, who will not be greatly benefited and advantaged by the possession of this book. It will save them money, save them trouble, save them time, save them litigation and lawyers' fees, and give them information that nobody can afford to be without.

12mo., 650 pages. PRICE, HANDSOMELY BOUND, \$2.00.

Sent post paid, on receipt of price.

A good, reliable agent wanted in every town in the United States. Also a responsible man at all prominent points, as General Agent. Also, a few wide awake men to travel in establishing agencies. Address,

BENJ. W. HITCHCOCK, Publisher,
14 Chambers-st., New York.

Papers giving this advertisement a conspicuous insertion, will receive a copy of the work.

SCHOOL TEACHERS WANTED.—The Subscriber wishes to employ for each town in the United States, male teachers who have formerly been engaged, either in Day Schools or Sunday Schools, who can devote their exclusive time to the business, to canvass for the "Illustrated History of the Bible," by John Kitto, D. D., F. S. A., edited by Alvan Bond, D. D., of Norwich, Conn. This is the best selling book I have ever published. Agents make from \$100 to \$300 per month, and say "they never knew a book to sell so well." Apply immediately in person or by letter to the publisher.

HENRY BILL, Norwich, Conn.

15 Months for \$1.00—THE AMERICAN STOCK JOURNAL.

Important to Owners of Horses.

Advice and Prescriptions for Sick and Injured Horses given Free.

The Editor of WILKES' SPIRIT OF THE TIMES desires to inform the owners of horses throughout the United States, that he has regularly engaged upon his paper, one of the ablest and most experienced professional veterinarians in the United States, whose special duty it shall be to answer, gratis, all questions relative to sick or injured horses which may be addressed to the SPIRIT, whether by subscribers or not. These answers will in all cases contain a prescription for the injury described, and will be printed, in connection with the question asked, in the following number of the SPIRIT. No answers, however, will be given by mail, it being a part of the object of the editor, to submit the ability of the professor, who has assumed this department of the SPIRIT, to the keenest criticism of the general public. By adding this useful department to the SPIRIT, the editor contributes to those of his readers and subscribers, who own horses, a horse-doctor free, and not only to his subscribers, but to every horse-owner in the United States who may choose to direct an inquiry to the SPIRIT by mail. The subscription price of the SPIRIT is \$3 a year; but single copies may be bought from news agents from week to week by those who desire to use it temporarily only, for veterinarian questions, at fifteen cents per copy. The SPIRIT OF THE TIMES is a high-toned gentleman's paper, which (with the old SPIRIT, whose business and title it inherits) is of forty years' standing, and is devoted to Hunting, Fishing, Racing, Field Sports, Literature, and the Stage.

GEORGE WILKES, Editor and Proprietor,
201 William-st., New York.

Dealers will continue to procure their supplies as heretofore.

Everybody Should Send for THE AMERICAN STOCK JOURNAL.

MAKE YOUR GRAPE VINES PAY. FULLER'S GRAPE CULTURIST.

New Edition, Revised and Enlarged.

By ANDREW S. FULLER.

Mr. Fuller's work met the general want of a plain and practical treatise on grape culture. As it was based upon established principles, it at once took rank as a standard work. Most of the treatises that have appeared since are nothing more than Fuller modified and diluted. When the structure and mode of growth of the vine is once understood, all systems of training become plain, and one may be followed as readily as another. Mr. Fuller gives this knowledge of the vine most clearly, and illustrates it so plainly that no one can fail to understand it, and for this reason his book has become remarkably popular, and has not been, nor is it likely to be superseded by any other work on the same subject. The teachings of the work are all from actual practice, and the illustrations are mainly from growing vines. To bring this work up to the times in respect to varieties, a considerable portion of the matter has been re-written. An additional list of varieties, including synonyms, has been given, and important additions have been made all through the volume. Garden culture is treated as well as that of the vineyard, and the book is equally adapted to the owner of a single vine or the one who has thousands of vines. Well illustrated.

SENT POST-PAID.

PRICE, \$1.50.

cheaper than by hand. Size as above: 100 to the pound. Price 15 cents per lb. Manufactured and sold by H. C. RICHARDSON, No. 40 Grand-street, Williamsburg, N. Y. Sold also by SARGENT & CO., 70 Beekman-st., New York.

WIRE FOR FENCES AND GRAPE VINES. GRINFILL BLAKE, 45 Cliff-st., New York.

\$3 Important to Farmers. \$3

Will be sent anywhere, free of Express charges, for \$3, one of McConaughy's Patent Corn Droppers, one of the most complete machines ever invented for dropping corn, sorgho and other seeds. One person, with a pair of these droppers, can drop 15 acres a day. It will drop it right in the cross. It can be set to average any number of grains desired to a hill. It can be regulated to scatter the corn more or less in the hill, or drop it all in a close bunch, if desired. In windy weather this dropper is just the thing needed, as the corn can not be blown about while dropping.

Three hands, with a pair of these droppers, and a double corn marker and drag, can mark out, drop and cover 15 acres a day; and it will be done much better than it can with any of the combined double rowed corn planters that have ever been invented. The corn will be straight both ways.

Agents Wanted.

THOS. B. MCCONAUGHEY, Newark, Delaware.

GEORGE MARSHALL, Manufacturer of Iron and Hardened Brass, Single and Double-Action, Lift, Force, and Wind Mill Pumps, suitable for all purposes and locations. Works 21 Dunham Place, Brooklyn, (E. D.) N. Y.

Clipper Mower and Reaper

This Celebrated and unequalled machine, heretofore made by R. L. Allen, of N. Y. City, is now manufactured by **The Clipper Mower and Reaper Company**, at their Works at Yonkers, N. Y., where they have unsurpassed facilities for the business. The Machine needs no encomium. Farmers throughout all sections of the country who have used it, are ready and willing to testify to its greatly superior qualities for all work, combining, as it does, more points of excellence than any machine yet made.

Its principal characteristics, are: *Simplicity of construction, Durability, Ease of Draft, Portability and Completeness of Finish in all its parts.*

These Machines are made of Four Sizes, to meet the wants of any farmer, as follows:

No. 1, One-Horse machine (30 in. wheel), 3½ ft. Swath.

(The only practical One-horse machine in market.)

No. 2, Two-Horse (light) 30 in. wheel, 4 ft. Swath.

No. 3 " " (medium) 32 in. wheel, 4½ feet Swath.

No. 4, " " (large) 36 in. wheel, 4½ and 5 ft. Swath.

Made also as a Combined Mower and Reaper.

Address THE CLIPPER MOWER & REAPER CO., Nos. 12 & 14 Cliff-st., New York City.

Stone and Drain Plow.

Acres of rocks and stones for fencible dug, or hundreds of rods for underdrains loosened to any depth ready for shoveling in a single day, with a single team, with one of Henry E. Plumb's Patent Stone and Drain Plows. Price \$10.

For Sale also, two styles of Patent Harpoon Horse Hay Forks—one McEwen's, the other Hubbell's. Price \$10 each. Agents Wanted. Active agents can make from \$30 to \$100 per week in the sale of these implements. Also rights for my celebrated

RAILROAD PITCH FORK.

PROPRIETOR.

The New Circular of Prices (by the dozen, 100 and 1000,) for the Spring of 1867—Just Published.

I offer our usual large and fine assortment of every description of

HARDY TREES AND PLANTS,Including
Standard and Dwarf Fruit Trees, Vines, etc.,
and**Hardy Ornamental Trees and Shrubs,**
and **Roses.**

I mention the following

(Extract.)

SPECIALTIES & NOVELTIES.

The following articles are particularly noted, because my stock of them is uncommonly good, on account of which, I believe, I can offer special inducements to purchasers:

Arbor Vitæ, Siberian and Hovei—A fine lot, one and two years old. See page 5.**Beech & Elm—**PURPLE-LEAVED—Good Plants, of different sizes. See page 4.**Berberry—**PURPLE-LEAVED—For hedges—a handsome stock. See page 5.**Deutzia Crenata—**FLORE PLENA—A new double-flowering Deutzia, perfectly hardy, and a decided acquisition. See page 5. Small 1 year old plants, for Nurserymen.**Grape Vines—**DELAWARE LAYERS OF BEARING WOOD—A very large lot of fine well rooted vines.**CREVING—**Strong Vines, 2 and 3 years old, in large quantity.**IONA, ADIRONDAC, and all the newer sorts—**excellent vines, in large quantity.**Japan Quince—**A very extensive stock of this fine flowering shrub, especially adapted for making beautiful hedges. See page 5.**Juniper, Irish—**A great quantity of fine young Plants of this popular Evergreen. See page 5.**Pansy—**A new double-flowering pansy; quite unique. Price, \$3.00 per doz.**Peach—**Van Buren's Golden Dwarf—a real dwarf, very hardy, and a decided acquisition. See page 3.**Pine, Dwarf—**PINUS MONTANA—Good, stocky young Plants of this handsome Evergreen, now rapidly coming into favor. See page 5.Smaller Plants, same age as the others noted, \$15 per 100.
Roses—Strong Plants, on their own roots, grown from cuttings, (not root grafted.) One of the finest assortments of Hybrid Perpetuals that can be found. See above.

For sale by **SAMUEL T. THORBUURN,** Seedsman,
46 Hudson-street, Albany, N. Y.**HUBBARD AND TURBAN.**

My specimens of these two squashes received the two prizes offered for the best squash for family use, at the last exhibition at the rooms of the American Agriculturist. As this was open to competitors in all parts of the United States, the Hubbard and Turban can fairly be ranked as the two best varieties for table use, and hundreds of letters received this season speak of them as "the sweetest, dryest and best flavored squashes known." Both kinds can be kept through the winter.

As the original introducer of these two squashes, I send packages of the purest seed in the market to any address, at 15 cents each.—Once packages, Hubbard, 33; Turban, 39.—Pound packets, Hubbard, \$2.00; Turban, \$2.50.—All warranted to reach the purchaser. If any person, after trying these, does not find them to be what I represent, I will refund his money. **JAMES J. H. GREGORY,** Marblehead, Mass.**SEED POTATOES.****Early Goodrich, Harrison, Cuzco, Gleason, Coppermine, Calico, Monitor, Pinkeye-Rustycot, White Peach Blow, Fluke Union, Holbrook, Early Cottage, Sebco, and other varieties** will be mailed in packages containing 4 pounds of either variety, post-paid to any address, upon receipt of One Dollar. HOVEY & CO., 53 North Market-st., Boston.

GRAPE VINES FROM THE KNOX VINEYARDS.

The largest and best Stock we have ever offered, including all the Old and New Varieties of any merit.

What we **do not**, and what we **do** claim for our Vines: We **do not** claim that they are superior to all other Vines in the market. Other propagators, with **similar advantages**, may produce equally as good.

We **do** claim that the quality of our Vines is unsurpassed by any in the Country, and that they will give entire satisfaction to the purchaser in their **growth and yield of fruit**. We found this claim on the following facts:

First.—Our Vines are grown from Mature Wood, taken from our bearing Vineyards, thus securing health and correctness. We use no green wood in propagating, and grow **Grapes as well as Vines**.

Second.—We start our Vines in propagating houses, and as early as the weather will admit turn them out into the open ground, where they are carefully cultivated during the entire growing season.

We regard this system of producing Vines as the very best, and much preferable to that of growing them under glass, with their roots cramped in pots.

We secure by our mode, healthy, stocky and well rooted Vines.

Third.—Our soil is peculiarly well adapted to the production of Vines of the best quality, and we use no stimulants to excite an unnatural growth.

THE CONCORD

did not need the strong endorsement it has received the past year, as the **PEOPLE** had already decided that it is **THE** Grape of America. But it is worthy of note that in addition to its continuance in well-doing, it has been awarded, without any effort or management on the part of its friends, the

GREELY PRIZE

as the Grape of the greatest value. The eminent Pomologists who made the award took ample time and unusual pains to arrive at a correct conclusion, and however *interested parties* may demur, the **PEOPLE** are well satisfied with the decision. As evidence of this, at a late trade sale

Marblehead Mammoth Cabbages!

As some cultivators have an impression that these cabbages cannot be fully matured outside of Marblehead, I invite their attention to the following list of weights to which they have been grown by some of my customers:

H. A. Terry, Crescent City, Iowa, has grown them weighing 40 lbs., measuring 56 inches around the solid head. Thos. A. Lambert, Beaconeur, C. W., exhibited three cabbages weighing respectively 40, 42½ and 41 lbs. John W. Dean, St. Michaels, Md., has grown them weighing 33 lbs. S. M. Shuck, Preston, Minn., has raised them weighing 33 lbs. when trimmed. E. H. Ellis, Etina Green, Ind., has grown them weighing over 30 lbs. A. E. Garrison, Des Moines, Iowa, has raised them weighing 30 lbs. James S. Allen, Union Springs, N. Y., has grown them weighing 30 lbs., when stripped of loose leaves. Wm. Lee, Jr., Denver City, Colorado, has grown them weighing 45 and 50 lbs., as a penalty for which the miners of the Mountains call him the "Big Cabbage Man." Collis Eaton, Ogdensburg, N. Y., has raised them weighing 50 lbs. Leonard Choat, Denver City, Col., raised one, which when trimmed of waste leaves, weighed 46 lbs. P. Sweeney, Loretto, Penn., has grown them weighing 43 lbs. Sam'l B. Ormsbee, Rolling Prairie, Ind., has raised them weighing 33 lbs. M. D. Kyrle, Ohio, has grown them weighing 33 lbs. Chas. W. Oden, Little Sioux, Iowa, produced quite a lot which weighed from 50 to 60 lbs. Hundreds of others have written me that they have "taken all the prizes at the County Fairs." "Raised the largest Cabbage ever seen in the country." "Had astonished all their neighbors." That in sweetness, crispness, and tenderness, they were unequalled. As the original introducer of the Mammoth Cabbage, I am prepared to supply pure seed in packages containing about 500 seeds, at 25 cents per package, 5 packages for \$1, and larger quantities at a proportionate discount. Catalogue of over 200 varieties containing many new and rare vegetables, sent gratis to any address. JAMES J. H. GREGORY, Marblehead, Mass.

ALL STRICTLY MY OWN SELECTIONS. Fresh and true to name. Sent by mail for price named. For sale by SAMUEL T. THORBURN, Seedsman, 46 Hudson street, Albany, N. Y.

UNRIVALLED GARDEN SEEDS, of my own growing, and warranted A No. 1, for sale by FRANCIS BRILL, Catalogues gratis. 590 Ferry St., Newark, N. J.

SEND FOR CATALOGUE OF STRAWBERRIES, RASPBERRIES AND BLACKBERRIES, which contains prices to suit the wholesale, prices to suit the retail, and \$20 worth sent for \$10—to those who wish a variety list. Also, leading varieties of Potatoes. Address THOS. C. ANDREWS, Moorestown, N. J.

of vines—largely advertised all over the country—while other leading varieties would not sell, in quantity, at *one-third* the Catalogue prices, all the Concord offered were sold at twenty-three per cent. above Catalogue prices.

Our opinion of the Concord is well known, and we unhesitatingly re-affirm all we have said in its favor, and pronounce it the most valuable Grape in America yet tested. It is to be hoped that seedlings from it will take the highest rank among the Grapes of the country.

The proper place to determine the merits of a Grape is in the Vineyard, when in fruit.

For a number of years we have held on our grounds, during the fruiting season, Grape Exhibitions, which have been largely attended by the most prominent fruit growers of the country, all of whom, in their examination of our Vineyards, have been enthusiastic in their praise of the Concord. We refer to such men as Dr. Jno. A. Warder, Author of "American Pomology," Geo. Hussmann, Author of "Grapes and Wine," Wm. Saunders, Supt. of Gov't Gardens, Washington City; Prof. G. Thurber, Editor of American Agriculturist; A. Thomson, of Delaware; R. E. Mason, of St. Louis, and many others.

Our **Grape Show** this Year will be on the 16th and 17th of October. **Strawberry Show**, 12th and 13th of June. Both promise to be of unusual interest.

The Concord is no longer on trial. If it were, overwhelming evidence could be produced in its favor from all parts of the country.

Propagators, aware of its great popularity, and the immense demand there will be for Vines, are making every effort to increase their Stock.

Notwithstanding we publish that we will not part with any Cuttings—needing all for our own use—we have the most urgent orders for Wood.

William Griffith, of North East, Pa., writes under date of Jan. 18th, 1867: "I want a portion of your immense Stock of Concord Wood, say 500,000 Cuttings."

As we sell no Wood, and have greatly increased our facilities for growing Vines, our customers may reasonably expect to be supplied.

Tomatoes and Potatoes.

MAUPAY'S SUPERIOR and TILDEN, the two best market varieties. Sent by mail in 25 cent packages. GOOD-RICH and the seedling Potatoes. A full assortment of Garden and Field Seeds of choicest quality. Apply for Circulars.

JAMES J. H. GREGORY, Marblehead, Mass.

Vegetable and Flower Seeds.

Novelties and Specialties.

The largest collection ever offered in America. See Our New Amateur Guide, now ready, mailed free for 25 cts. WASHBURN & CO., Seed Merchants, Horticultural Hall, Boston, Mass.

Strawberries and Small Fruits.

Stinger's Seedling Strawberry, a new variety of great excellence; Philadelphia Raspberry, and other Small Fruits. Circulars on application. WILLIAM HACKER, Seed Grower and Importer, 803 Market Street, Philadelphia, Pa.

Our Stock of Concord this season is very large and superior, which we offer on most favorable terms.

For further information send 10 cents for Catalogue.

We have also a large supply of

HARTFORD, CREVELING, IVES, RENTZ, ELSINGBURG, MAXATAWNY, DELAWARE, DIANA, ROGERS' HYBRIDS, IONA, ISRAELLA and ADIRONDACK.

Also a limited quantity of

MARTHA and BLACK HAWK,

(Seedlings of the Concord,) which we think will prove the **two most valuable new Grapes now before the public.**

For description of above, and much other valuable information on Grape Culture, send 10 cts. for Catalogue.

STRAWBERRIES.

Wishing to have the

JUCUNDA—OUR NO. 700,

The most valuable of all our Strawberries, tested as soon as possible very generally throughout the country, we will send Plants at the following Prices:

BY MAIL—\$1 per dozen; \$5 per 100.

BY EXPRESS—\$40 per 1000; \$100 per 3000.

All other desirable varieties for sale. Also

Raspberries, Blackberries, Gooseberries, Currants, &c.

All orders shall receive prompt and careful attention.

J. KNOX,

Box 155, Pittsburgh, Pa.

GRAPE VINES.

DELAWARES, 2 years old at special rates, very low—and all the other leading varieties. J. W. HELMER, Lockport, N. Y.

Grape Vines by Mail,

AT THE FOLLOWING RATES:

IONA, three years old, \$2.50 each.
" two years old, \$2.00 each; \$18 per dozen.
" one year old, \$1.00 each; \$10 per dozen.
" " No. 2, 75 cents each; \$6 per dozen.
ISRAELLA, three years old, \$2.50 each.
" one year old, \$1.00 each; \$10 per dozen.
ALLEN'S HYBRID, three years old, \$2.50 each.
" one year old, 75 cts. each; \$7 per doz.
DELAWARE, three years old, \$2.50 each.
" two years old, \$1.00 each; \$10 per dozen.
" one year old, 50 cents each; 4 per dozen.
DIANA, two years old, 50 cents each; \$4 per dozen.
All raised from strong wood of bearing vines.
CHARLES S. MASON, West Hartford, Conn.

GRAPE VINES.—Strawberries, Raspberries and Blackberries, old and new varieties, in large or small quantities and at reduced prices. *No charge for packing and charges pre-paid*, all stock sent out warranted true to name. Send for spring Catalogue. HATFIELD'S FRUIT FARM AND NURSERIES, Box 240, Niles, Michigan.

Iona Vines for Early Fruiting.

EXTRA LAYERS of IONA for early bearing, at \$3 each, or \$24 per doz. Also Iona and Israella, grown from single eye, and wood of both these varieties for propagation. Address A. BUSHNELL, Peekskill, Westchester Co., N. Y.

SING SING GRAPE VINES.

The Best in the Market.

All my large stock of No. 1 and No. 2, Iona and Israella Vines is sold, except a small quantity I have reserved to use in filling retail orders. As has been the case every season, the demand for *really good* vines, has been beyond my ability to supply. That my vines sell so readily at *full rates*, argues well that the *quality* of vines offered will hereafter have much to do with their sale. Buy good vines at a good price, rather than vines advertised at reduced rates. You may be sure that with the present great demand for vines, all of good quality will be sought after at good prices.—Send for Price List. J. F. DELIOT, Vine Grower, Sing Sing, N. Y.

Iona and Israella Grape Vines,

By the single vine or 10,000. In point of quality we challenge the country.

Mr. Charles Downing says of this stock: "The vines are certainly as fine, if not the finest one year old plants I ever saw."—Send for Price List, which will be found *satisfactory*. Good wood for propagation.

HOLTON & ZUNDELL, Havercrstraw, Rockland Co., N. Y.

GRAPE VINES

AT
REDUCED PRICES.

Iona No. 1, \$35 per 100; \$300 per 1000.
Delaware No. 1, \$20 per 100; \$150 per 1000.
Ives' Seedling, \$25 per 100; \$200 per 1000.
Norton's Virginia, \$25 per 100; \$150 per 1000.

These are really No. 1 plants, none having been selected from them to sell as extras.

We offer also a good stock of the smaller sizes of these sorts, as well as fine plants of almost all the other varieties of vines, and for prices refer to our Descriptive Catalogue of Grape Vines.

PARSONS & CO., Flushing, N. Y.

Adirondac Grape Nursery and Vineyard.

Superior Vines of one, two, and three years at reduced prices.

Adirondac, Iona, Israella, Allen's Hybrid, Concord, Crevelling, Cayuga, Delaware, Diana, Hartford Prolific, Isabella, Loomis' Honey, N. Muscadine, Rebecca, Rogers' Hybrid, Sherman, To Kalon, Maxatany, and Union Village.

Vines securely packed (and if not too bulky) will be sent by mail, prepaid, and at our risk. Larger packages by Express, with additional vines to the probable amount of Express charges. Our New Spring Catalogue sent to all applicants.

PERUVIAN GUANO SUBSTITUTE!

BAUGH'S RAW BONE Super-Phosphate of Lime.

BAUGH & SONS,

Sole Proprietors & Manufacturers,

Delaware River Chemical Works,
PHILADELPHIA, U. S. A.

For Corn, Oats, Potatoes, Garden Vegetables,
and every Crop and Plant.

Especially recommended to the growers of
**Strawberries, Raspberries, Blackberries,
And All Small Fruits.**

BAUGH'S RAW BONE SUPER-PHOSPHATE OF LIME,

Is very prompt in its action—is lasting in effect to a degree unattained by any commercial manure in the market. As a Substitute for Peruvian Guano and Stable Manure it is eminently a success, and is offered to the Agriculturists of the Northern and Eastern States as a fertilizer that will cheaply restore to the Soil those essentials which have been drained from it by constant cropping and light manuring.

Our NEW PAMPHLET—"How to Maintain the Fertility of American Farms,"—90 pages, giving full information in regard to the use of manure, &c., will be furnished gratis on application.

BAUGH BROTHERS & CO.,
GENERAL WHOLESALE AGENTS,
No. 181 Pearl-st. and No. 4 Cedar-st.,
NEW YORK.

TO FARMERS AND PLANTERS.

The Lodi Manufacturing Company, (Established since 1810,) having the exclusive control of all the night soil of New York City, offer for sale their Celebrated Poudrette, warranted the best fertilizer for the price in this country. Experience has shown that it has no equal for Corn, Cotton, Tobacco and Vegetables. It prevents worms from destroying the seeds. It ripens the crop from two to three weeks earlier, and adds from $\frac{1}{4}$ to $\frac{1}{2}$ to the yield.

It is of better quality and much finer than ever made heretofore.

Price, \$2.00 per Barrel—Cash.

The Company are also manufacturing Double Refined Poudrette, as fine as flour, concentrated and free from nearly all extraneous matter—samples of which will be sent by mail on receipt of 3-cent stamp.

It is packed in new barrels and shipped without extra charge for package or cartage in New York City.

Price for the double refined Poudrette, \$25 per Ton.

The Company's Farmers' Almanac, giving further particulars, will be sent free by addressing

THE LODI MANUFACTURING COMPANY,
66 Cortland-st., N. Y.

MILLER & SMITH'S

STANDARD

Super-Phosphate of Lime

Is offered in the assurance that it is the best, and most economical Fertilizer in the market.

The Manufacturers introduce their Super-Phosphate, with the guarantee that it is perfectly free from adulteration.

The great superiority claimed over other Fertilizers in the market is:

FIRST, That it is manufactured chiefly from Pure Bone.

SECOND, That a sufficient quantity of acid has been used to convert the insoluble Bone into Super-Phosphate of Lime.

THIRD, That the Bone being unburned retains the Ammonia, and is a true Raw Bone Super-Phosphate.

For Sale by

GET THE BEST WEBSTER'S DICTIONARY UNABRIDGED NEW ILLUSTRATED

OVER 3000 FINE ENGRAVINGS.

10,000 Words and Meanings not in other Dictionaries.

A necessity to every intelligent family, student, teacher and professional man. What Library is complete without the best English Dictionary?

"Superior, in most respects, to any other English Dictionary known to me."—Hon. George P. Marsh.

"All young persons should have a standard Dictionary at their elbows. And while you are about it, GET THE BEST: that Dictionary is NOAH WEBSTER'S—the great work, unabridged. If you are too poor, save the amount from off your back to put it into your head."—Phrenological Jour.

"Every farmer should give his sons two or three square rods of ground, well prepared, with the avails of which they may buy it. Every mechanic should put a receiving box in some conspicuous place in the house to catch the stray pennies for the like purpose. Lay it upon your table by the side of the Bible; it is a better expounder than many which claim to be exponents. It is a great labor saver; it has saved us time enough in one year's use to pay for itself; and that must be deemed good property which will clear itself once a year. If you have any doubt about the precise meaning of the word clear, in the last sentence, look at Webster's nine definitions of the *v. t.*"—Massachusetts Life Boat.

TO ADVERTISERS.

Our readers will find the advertising columns of THE WEEKLY TRIBUNE exceedingly interesting, representing as they do nearly all the branches of business.

THE WEEKLY TRIBUNE's circulation is steadily increasing and is greater than that of any other newspaper.

Notwithstanding its large size, the pressure of news is so great that we are compelled to allow but a small space for Advertisements. This is a manifest advantage to all whose notices appear in THE WEEKLY TRIBUNE, as they are conspicuous and mostly read with as much interest as the news.

That it is the most economical medium for advertising is well known, and conclusively proved by those whose advertisements frequently or continuously appear in its columns.

Circulating as it does among the thrifty, industrious body of the people, the Farmers, the Mechanics, the Merchants, the Manufacturers throughout the country, it is eagerly read by their wives, sons and daughters, so that it is reasonable to suppose each advertisement in it is read every week by at least half a million of the most intelligent portion of the community.

The great advantage that must accrue to any one who takes this method of making known his wants, his merchandise or manufactures, it is very easy to understand but can hardly be overestimated.

Every person having a farm for sale should advertise in THE TRIBUNE. Make the advertisement as short as possible, stating the advantages offered. Farmers wishing to purchase farms can always find chances by inserting a short advertisement in THE WEEKLY TRIBUNE.

Implement Manufacturers and Seedsmen find THE WEEKLY TRIBUNE especially valuable as an advertising medium, circulating, as it does, mainly among the better farmers in all parts of the country, in every State and Territory.

Terms for advertising in THE WEEKLY TRIBUNE are \$1.50 per line for ordinary advertisements, and \$2.00 per line for Items in the news columns, prefixed by the word "Announcement." Nothing is inserted for less than \$3.00. Cuts and Large Type charged double rates for space occupied.

SEND FOR A SPECIMEN COPY.

Address **THE TRIBUNE, New York.**

The Immense Profits OF THE TEA TRADE.

The Proprietors of "THE GREAT AMERICAN TEA COMPANY," became fully convinced, several years ago, that the consumers of Tea and Coffee were paying too many and too large profits, on these articles of every day consumption, and therefore organized THE GREAT AMERICAN TEA COMPANY, to do away, as far as possible, with these enormous drains upon the Consumers, and to supply them with these necessities at the smallest possible price.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for all the profit he can get.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the list is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

The Company have selected the following kinds from their Stock, which they recommenced to meet the wants of clubs: They are sold at Cargo Prices, the same as the Company sell them in New York, as the List of prices will show.

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for clubs of less than \$30.

All goods sold are warranted to give satisfaction.

PRICE LIST:

YOUNG HYSOY (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

MIXED, 70c., 80c., 90c., best \$1 per pound.

JAPAN, \$1, \$1.10, best \$1.25 per pound.

COOLONG (Black), 70c., 80c., 90c., best \$1 per pound.

IMPERIAL (Green), best \$1.25 per pound.

ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

GUNPOWDER (Green) \$1.25, best \$1.50 per lb.

P. S.—All towns, villages, or manufactories, where a large number of men are engaged, by CLUBBING together, can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey-Street.
Post Office Box, 5,643 New-York City.

We call special notice to the fact that our Vesey Street Store is at Nos. 31 and 33 Vesey Street, a large double store.

From Moore's Rural New Yorker.

THE GREAT AMERICAN TEA COMPANY.

EDS. RURAL NEW-YORKER:—Seeing that the Great American Tea Company advertise extensively in your columns, I thought it would not be improper to inquire of you concerning them,—whether they are sufficiently reliable for farmers to depend on them for their teas,—whether they have a large amount of capital in it, or not, &c. Or, is it one of the many humbugs with which our country is infested now-a-days? Please answer through the RURAL, and you will greatly oblige many of its constant readers.—M. W., West Liberty, Iowa, Dec., 1866.

REMARKS.—The above inquiry was received some weeks ago, and although we were confident the Company alluded to was reliable, we wished to "make assurance doubly sure," and therefore wrote to an intelligent friend in New York city for information on the subject, inclosing the note of M. W. To our letter of inquiry we have received substantially this reply:—"I am confident the Great American Tea Company is 'reliable' in every sense of the word. The Company has, I believe, eight large stores in this city and Brooklyn. It sells, probably, one third of all the tea imported in New York. In furnishing farmers by the club system, every pound of tea is warranted to give satisfaction, or money returned. Satisfaction is always given, so far as it would appear from the testimony of the subscribers to the religious papers of this and other cities, and the Company is indorsed and recommended by the editors of the same papers, and other influential journals. I learn that nearly fifty persons, from the offices of these papers, are buying constantly of the Company, and you know printers and editors are not likely to patronize humbugs. If any person is fearful that he will not be treated fairly by the Company, let him write to any one of the thousands of persons whose names have been published as its customers. I have taken time to find out that the statements here made are correct."

In confirmation of the statement of our correspondent, we will only add that several prominent religious and other journals of New York strongly indorse and commend the Great American Tea Company, and that, though we have advertised it for months, we have never received a complaint from any of the large number of RURAL readers who must be its customers. We therefore feel like commending the Company as eminently reliable and worthy of confidence.

On page 150 of the *Agriculturist*, the Company publish their mode of doing business, and other matters interesting to consumers of Teas and Coffees. It is worthy of perusal.

COAL.

The subscriber respectfully informs parties wanting Coal the ensuing season, that he personally attends to filling orders, free of charge, for all the best kinds of

AMERICAN OR FOREIGN COAL,

on the market, to suit the various purposes they are designed for, at the lowest wholesale prices.

Purchases made at the PUBLIC AUCTION SALES on a small commission.

GEO. W. PECK, Broker,

110 Wall-street, New York.

A NEW GRAPE. SALEM.

The subscriber now offers for sale for the first time the above grape, named SALEM from the place of its origin. It is a variety considered not only superior to any of the former well-known numbers, but also to any hardy grape at present before the public, combining, as nearly as possible, every quality desired in an out-door grape; being one of the hardiest, healthiest and most vigorous of vines, and producing enormous crops of beautiful and high-flavored fruit.

Like the other well-known kinds, Nos. 4 and 15, this is a hybrid between the native and Black Hamburg; bunch large and compact; berry large as Hamburg, of a light chestnut or Catawba color, thin-skinned, perfectly free from hard pulp, very sweet and sprightly, with a most exquisite aromatic flavor, not equalled by any other out-door grape for wine or table; as early as Delaware or Hartford, having never failed to ripen in the most unfavorable season for the past six years.

Taking all its qualities into consideration, earliness, hardiness, and great vigor of vine, size and quality of fruit, it is pronounced by a few of the best judges who have tried it to have no equal among all the numerous varieties now before the public; and I can, with confidence, recommend it as the best of all my collection, and now offer it for the first time.

E. S. ROGERS,
Salem, Mass.

NOTICE.

The subscriber would here state that he has disposed of his entire Stock of Vines and Wood of the Salem Grape to J. L. Waring, of "Amenia Vineyard," Amenia, Dutchess County, N. Y., to whom all orders for the same must hereafter be addressed.

Salem, Mass., March 2, 1867.

The undersigned will dispose of a few layers of the Salem, with two eyes, at \$3 each, and next autumn be prepared to supply One Year Old Vines in quantity.

The demand for this valuable Grape will be large, it is therefore advisable for those who wish to secure them to apply early.

\$120 per 1000.
PARSONS & CO., Flushing, N. Y.

IONA VINES.

All who have read our article, published as advertisement in the three last numbers of the *Agriculturist*, have had reason to see that the Iona Grape must soon supersede all others for all purposes. Like the famous Pinot of France and Germany, it gives good results wherever any good grape will thrive, and, like that, it combines all of the excellent qualities to be found in the best grapes of any country. In size and productiveness it is entirely unlike the Pinot. That is small and unproductive, and does not permit of that generous treatment generally designated as "high culture," by which its productiveness might be increased.

The Iona is large and extremely productive; and although thriving under the most moderate culture, is as well able to bear generous treatment, with the best results, as the Delaware. This has been fully shown by extensive trial in all parts of the country. A full statement of its unequalled wine-producing qualities would require an extended essay. No grape but the Delaware can stand one moment in comparison with it, and that falls far below it. This is fully admitted by every wine-maker who has taken pains to become informed on the subject. Excellent wine, like that which brings seventy-five dollars per dozen at wholesale, can be made from it in every family that will provide the grapes.

Under the prescribed conditions of treatment, which are plain and simple, and just those that all grapes require, it is the most constant in the production of thoroughly ripened crops of any grape in cultivation, and has often attained full success by the side of Concord that have failed. It ripens as early as Delaware, and earlier than Concord.

The plants that I offer for gardens are better and cheaper, probably, than will again be offered. Their quality is unapproachable by any in market, and the quality of my vineyard vines, and their prices, are such that few who see them fail to purchase.

There can not be a more opportune time than the present for the purchase of vines, and the vine to plant is the Iona. If those offered at treble reduced prices are good vines, buy them at once; the country has need immediately of one hundred times as many as are now for sale, to banish false wines, and introduce true wines in their place.

But to learn whether mine are not the cheapest in the market, send for samples, or call and examine my stock. I promise to make very advantageous trades; and nearly all who have called, after thorough examination elsewhere, have practically admitted it by making large purchases. My largest sales have been to persons who have looked in vain for vines of satisfactory quality at "reduced rates."

Send two cents for pamphlet and price list, with inducements to clubs, and engravings of Iona and Israelia. Manual of the Vine sent for 50 cents.

C. W. GRANT,

Iona, near Peckskill, N. Y.

FROM HENRY WARD BEECHER.

BROOKLYN, Feb. 7, 1867.

W. L. BRADLEY, BOSTON:

DEAR SIR: I tried several barrels of your XL Super-phosphate of Lime during the season of 1866, on my farm at Peckskill. The soil is a sandy loam, on a clay and gravel subsoil. I found it to be excellent upon all garden vegetables, peas, beets, lettuce, cabbages, &c.

The onions, of which I raised several acres, were so much influenced by it, that the difference between those which had received your Phosphate and those on which I had used another favorite brand was distinguishable at a long distance off. I used it upon grass with very satisfactory results. My foreman, T. J. Turner, who more particularly noticed the detailed effects, speaks very highly of it.

- If its quality is faithfully kept up to the standard, it can not but satisfy every reasonable expectation.

HENRY WARD BEECHER.

[COPYRIGHT SECURED.]

THE MOOSE—MALE AND FEMALE. — (*Alce Americanus*).—Drawn and Engraved for the American Agriculturist.

This is the largest of the deer family, as well as the most ungainly and awkward. It has none of the grace of other deer, but moves its ponderous body (weighing often ten or twelve hundred weight) with a plunging, reckless gait, often, it is said, meeting with mishaps, and falling from treading on its own feet. The forests of Maine, Northern New York, and Michigan, are its southern limits. The Elk of Europe and Asia (*Alce malchis*) is closely allied to the Moose, but a distinct species. The animal we call Elk should be called the American Stag, and the Moose is really the American Elk. The form is well shown in the engraving. Very high at the withers, and sloping to the tail, the

fore legs long and stiff, the head enormous, ears large, the nose and upper lip pendulous, the horns flat, palmated, ending in numerous tips, and very large. The Moose is a semi-arctic and semi-aquatic animal, feeds upon water plants, moss, and twigs, and remains in winter in what are called "yards," where the snow is kept trodden down. The males are called bulls, and the females cows; they are hunted in canoes upon the lakes, or on snow shoes, when deep snows impede the going of the animal. The flesh and hide are both of value, but as a general thing the animal is more hunted for sport than for profit. They are taken in pit-falls also and by nooses. The strength of the animal is in pro-

portion to its size, and its speed is very considerable. The Moose, as well as its European congener, has been repeatedly tamed, and, like the rein-deer, made to draw wagons and sledges. During the breeding season, however, the males become utterly unmanageable and so dangerous that their use has to be dispensed with. We find no record of the use of emasculated animals, but see no reason why they might not be made as docile as oxen, while at the same time they would be profitable for their meat, as they feed on a great variety of coarse herbage, green and dry. Domestication would doubtless also change their fierce nature. It seems a pity that so valuable an animal should become extinct,

Peruvian Maize.—We learn from Mr. E. G. Squier, that he ordered a supply of the Peruvian Maize, (see p. 219, 1866,) as he supposed in abundant time for it to arrive early this spring. Up to this time we have heard nothing further of it. If it does not come by or before the first of May, it will be too late to give it a fair trial this year, which we shall very much regret.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MAY, 1867.

April is called "fickle, frail and fair,"—"tearful" and "sighing."—We talk about April showers and May flowers, and about smiling and blushing May, as if April were the cold and rainy month in which sunshine was the exception and drizzly spring rains the rule—and even that rule not to be depended upon. Not so. May is the fickle sister, whose smiles are capricious, whose promises are frail. We usually have fine dry weather in April, which enables us to finish up a great deal of work and get ready for May plauting. So it has been this year. The spring was very late in March, but the warm weather early in April dried the ground, enabled farmers to plow, haul manure, and get their spring grain in very well. We fear in consequence of so fine an April, a cold May, but the long lingering of winter gives hope against this. Nevertheless we must repeat our caution against too early planting the main crops of Indian corn, beans and roots, except potatoes, for you will lose seed, by its rotting in the ground; or the weeds will get such a start, that carrots, parsnips, mangel wurtzels or beets will be choked, if they come up, before they can be hoed. Sow all such seeds when the ground is dry and warm, and not before.

Take care to cultivate no more land than you can do well by, without working yourself to death, or overworking either teams or men. This will secure thoroughness, and larger profits if not larger crops. Make provision for work to fill up all the "spare time," so that you will not have any. That is—for rainy days, and days when the ground is wet and can not be worked. A few roots of carrots or beets, for stock, are excellent for this, because they must be hand-weeded and thinned out on damp and rainy days. Give men and teams always good long "noon spells," but exact promptness to begin work, and willingness to stick to it and do it well.

To "Gentlemen Farmers" let us say—know how to handle every tool, and if you do not now, practice "on the sly" until you can show any awkward man how he should do his work. You gain much by beating a workman at his own trade, and it is very easy to do it, if you have a modicum of knack and common sense. You may almost always calculate with certainty, on mind against muscle, with a quill or a crowbar. Learn to judge accurately and justly of a good day's or hour's work, not by what you can do yourself, but by what an active, thorough man can do, when you are with him. Bear down as hard as you please on the shirks; they will wince, but stand it, and perhaps do better. If you are unjust to a faithful man, he will be very apt to "flare up" and quit, as he should, if he can not serve you without lowering his own self-respect. Elevate your men, by your just dealings with them, interest in them, and care for their improvement. Furnish them reading for Sundays and evenings. Give them such papers as this, and such books as the *Agricultural* and *Horticultural Annuals*, *Herbert's Hints to Horse-keepers*, *Johnson on Peat*, the *Hop*, *Flax*, *Onion* or *Tobacco culture* handbooks, etc., etc. point out particular views as expressed in other books, which you use as guides to practice.—The practice will surely pay.

Hints About Work.

What would you give if your land—all of it—were now dry enough to plow? Would it not be worth \$5 an acre to you more this very year and every year? Five dollars is ten per cent. interest on \$50, which it would cost to drain it, grade it, and put it in excellent shape—and after all in nine cases in ten, \$5 would not represent half the profit. The article on draining in the *Agricultural Annual* is full of good ideas and suggestions to any one who wishes to be thorough in his farming, and this is the season when a man's needs press upon him the consideration of this very important subject.

Spring Grains.—It is seldom worth while to sow oats, barley or spring wheat, unless it can be done during the dry warm spells which we always get,

some time in March or April. This weather sometimes lingers into May, being broken up more or less, and sometimes comes all together, four or five weeks of it. If you are caught by cold rains, coming the last of April or early in May, let the spring grains go, and put something else in the land. Corn manured in the hill, or, if the soil is fit, roots of some kind. This is a general rule, but when the rains are early and apparently over before the middle of the month, good crops of wheat are occasionally obtained, and oats may be profitably sown when straw for fodder is the principal desideratum, but the early sown always yield the best grain.

Root Crops.—See hints given last month in regard to roots that will bear early sowing. In field culture do not put the drills too close, 20 inches is near enough for carrots, and 2 feet for mangels and beets. The soil for *Parsnips* must be deep and well enriched throughout—no shallow culture will do at all. They do well in heavy, clayey loam. Sow when the ground is warm, in drills, 20 inches to 2 feet apart, according to the depth and richness of the soil, and the size to which the roots will grow. The tops will in a measure correspond, and should have space to expand. Delay sowing *Rutabagas* (Swedish turnips) until June. All these crops should be hoed by horse power; and there are several horse hoes, well adapted to the purpose. Weeding in the drills, and thinning the very young plants, must be done by hand, and on rainy days, or towards night. On fair days, only when the ground is moist. Should the hot sun strike the young plants within 12 to 15 hours after the soil about them has been disturbed, a great many might disappear at once. Never let the weeds get a start, if you do, a dry hot spell in June would almost entirely prevent proper weeding, and the crop would be lost. Soak beet seed in hot water, keeping it blood warm 24 hours.

Corn.—Be in no hurry about planting. There is a tendency to err in planting too large varieties, and those that need a long season. This leads to planting too far apart. On soils properly manured $3\frac{1}{2} \times 3\frac{1}{2}$ feet is far apart enough for the hills of our largest flint corn, and 4 feet each way, right for dent corn. The little northern varieties should be much closer; sown in drills, 3 feet apart, and stalks left 8 inches apart in the drills, very heavy crops are often obtained. The roots of corn wander a good way, hence on only moderately enriched land the plants must stand further apart. Corn rarely begins to grow before the middle of June, and if well up by the last of this month or the first of next, it is well enough.

Broom Corn.—Use a little manure in the hill, planting on a good sward. Lime slaked with brine is advisable, harrowed in at the rate of about 20 to 50 bushels to the acre, if the sod is infested with wire or cut worms. Ashes and plaster mixed, in the hill, or dropped upon it, is a good application. The culture is, in short, much like corn, except more seed is sown. The plant does not do so well on stiff soils, and should not be exposed to early frosts. The hills should stand $2\frac{1}{2}$ feet apart, in rows 3 feet apart. Plant before the main crop of corn (1st to 15th of this month).

Flax.—Go through and weed carefully by hand, when the plants are 2 to 4 inches high, let the weeds be bare-foot; children are best employed.

Hemp may be sown any time this month. Use 4 to 6 pecks of heavy, bright seed, for broad-cast sowing. Be thorough in keeping the grass down.

Cotton.—See articles on culture in this and previous numbers.

Castor Beans.—An article on the cultivation of this plant on page 171 will repay perusal.

Tobacco.—The seed-bed, which, having been well prepared in a warm place and rich soil, will be just now showing its covering of minute round leaves, close to the surface, should be watered with dilute liquid manure, from the barn yard, or with guano water, very dilute, and any weeds, showing themselves, should be pulled out. Tobacco sowed May 1st will be a little late, but will do very well to fill out after the first planting—as is usually needed.

Potatoes.—See hints given last month. Late planted potatoes often escape rot, but are sometimes the worst victims. The newer kinds, as a rule, are least affected, but they succumb after a few years.

Cows.—Consider the advantages of having beets or parsnips to feed the cows before the pastures are ready for grazing, and make sure of some for next year. New milk-cows need succulent food before grass comes, but do not hurt the pastures for all summer by feeding them off too early in the season.

Calves may be let run as soon as they can get a "bite" of grass, and beug fed regularly besides, they will pick up a good part of their living and improve fast on skim-milk and a little meal.

Bees must not be allowed to fall away in the least, but their meal, if anything, be increased. At first, let them have but an hour or two a day at grass, making no difference in their feed. Gradually increase the grass and decrease the meal.

Horses and Working Oxen, should have well fitting harness and yokes, long noons to feed, and hard work every day. Plan to keep them employed or they grow soft, and you lose the cost of their keep.

Sheep.—Shear, without washing, in May, the earlier the better, if you can give the naked animals protection against storms. There is much less risk of hurting the sheep, than is incurred by washing them. The flock should be thoroughly and carefully "tagged," and the clip may be tub-washed in a Doty washing machine, to advantage. Thus a large quantity of excellent manurial liquid is saved for the garden, and with merinos, this is quite an object, on account of the great amount of yolk, rich in potash. Do not change suddenly from hay to grass.

Soiling.—Sow corn in drills 2 feet to 2½ feet apart, dropping about 12 kernels to the running foot, on well manured sod land, laid flat. This will furnish either green fodder for cows in dry weather, or it may be cut and cured for winter feed, for either of which it will pay better than almost any fodder crop. Sow as early as the 15th, and keep the ground stirred until the crop shades the ground.

Birds.—Protect them on every part of the farm.

Implements.—Be in time about ordering those you need, secure strength when that is needed, but lightness and durability combined for all hand tools. Every farmer needs a good horse rake, of which there are several, a good horse hay-fork, (see page 176), and it will pay most farmers to have a mowing machine, and a combined mower and reaper, such as the "Buckeye" or Allen's "Clipper." The neighbors will be glad to hire it. Don't lend such a tool, nor let it without your own man to go with it, even if you are "your own man."

Work in the Horticultural Departments.

The willows and poplars have hung out their tassels—like banners of the advancing host, and admonish us, that these "notes" will reach the reader when he is surrounded by early flowers, and buds full of promise—hence they must be many, and each one brief, for in this working month one has little time to read long stories.

Orchard and Nursery.

The utility of heeling-in trees in a cool and shady place, will now be appreciated, as planting can be continued long after trees in the nursery have started to grow. In many cases

Trees from the nursery will arrive now, after a long detention on the way. When opened they may be shriveled and apparently worthless; if packed close and damp, their buds may have pushed out long white shoots. If shriveled, bury for a week, root and branch. If growth has taken place, cut back to a dormant bud; don't be afraid to use the knife freely—you will be glad next autumn.

Grafting can still be done, except with stone fruits, but when vegetation is active, use care.

Root-grafts.—If not yet set out, should not be delayed. Put in rows, 4 feet apart, and 12 inches in the row, pressing the soil firmly about them.

Planting in Orchard.—Many ask about this. Cultivate for the orchard. If any crop will leave the land cleaner and richer than before, grow it. Root-crops are best. Never grow grain, and of all things, don't try so greedily a weed as tobacco. The same remark holds as to setting strawberries, and other small fruits, between the rows of young trees. It may be profitably done, if the trees are not robbed.

Nursery Trees must be looked to. If suckers or useless shoots are rubbed off, as soon as they push, much future cutting will be avoided.

Mulching of young trees is to be done before dry weather comes on, straw, bog, hay salt, hay, etc., may be used. If no mulch is applied, keep the ground mellow by frequent stirring.

Insects.—"I shall move upon your works at once," should indicate the character of the warfare. When a "tent" is visible, however small the nest, be sure that caterpillars are there. Pull it down with the fingers, rub it off with a brush, swab it out with soft soap,—anything, but let it get large enough to do as a correspondent suggests—fire blank cartridges at it. The cecidius begins its work as soon as plums and cherries are large enough to sting. Jar the trees, catch the insect on a sheet, and burn or seal.

Seedlings of all kinds of trees are to be kept weeded and thinned, whenever too crowded. Some of the hardest forest trees, as oaks, need shading in their youth. This is especially true of young evergreens. A lattice of lath is best.

Fruit Garden.

Planting of all kinds may continue, provided the stock can be had in a sufficiently dormant condition, with the precautions noticed under orchard.

Grape Vines are frequently left down until danger of frost is over, and put up after the shoots have pushed. Great care in handling will be required. Vines trained on the arm system should have the arm bent in a curve to insure an equal starting of the buds. With newly planted vines let only one cane grow the first year; select the strongest that start, and cut off the rest. Put down

Layers of last year's wood. Leave the cane uncovered in the trench until the buds are well advanced, and cover with soil as the growth proceeds.

Cuttings of the grape, currant, and any others not yet planted, should be put in at once, and mulched with tan-bark or leaves.

Currants.—If the sickly appearance of the plants shows that the borer has entered them, cut away the affected part, if it takes the whole bush, and burn. Look out for the worm on the leaves; if it appears, dust with the powder of white hellebore at once. Mulching is of great benefit to this crop.

Insects.—Besides those mentioned under orchard, the annoying Rose-bug will often prove very destructive to the blossoms of the grape. This fellow seems to defy every application, and the only way is to shake him off early in the morning, and catch on a cloth or in a pan of water. Burn or seal.

Strawberries.—Plant, if not already done, even if it be late. Keep the beds clean. If they are mulched, pull up the weeds that force their way through. Put on a mulch before the fruit ripens, if not already done. Should there be a dry time, water, if practicable. Those who have facilities for irrigation should provide for this.

Packages.—If fruit is to be marketed, have baskets and crates ready and distinctly marked. There are so many kinds of baskets now in the market that one has a wide range in section. If in doubt which to buy, take the advice of your commission merchant, as local prejudice has much to do with the matter; a style of basket that is approved in one market may not take in another.

Kitchen Garden.

The first radishes, cress, or lettuce of one's own garden! No after crop ever seems so welcome as these first fruits of our spring sowing. Those who live in mild climates, or who use glass, may now enjoy these. The rest have to wait a little longer.

Asparagus.—Cut from established beds, taking care not to injure the root, nor trample the beds. When marketed it is hunched in bundles 6 to 8 inches in diameter, according to the season; have the tops even; cut the butts even; tie closely with two bass strings, and keep moist to prevent wilting. If the beetle appears, or its blackish caterpillar, each less than one-half an inch long, cut or burn every shoot on which it is found, if it takes the whole. It is a serious trouble, and demands severe treatment, or the plantation is done for.

Beans.—Plant when all danger of frost is over, in rows 2 feet apart. Early Valentine is the most popular early. Mohawk, China and others are good. Of pole beans the Lima is most esteemed, and needs a warm soil. Plant 5 or 6 around the poles, which should be 4 feet apart, and 6 or 8 feet high. Press the beans into the soil with the eye down. The Cranberry, London Horticultural and White Runner are good sorts for snaps or to shell. The New Giant Wax Podded, for snaps only, is as near perfection as we expect to see in a bean.

Beets.—The early sowings should be thinned to from 4 to 6 inches, according to the distance between rows. Sow early sorts, if not already done.

Cabbage and its varieties, Broccoli, Brussels Sprouts, Cauliflower and Kohlrabi, all need nearly the same treatment when young. Sow in a well prepared seed-bed in rows 6 inches apart. As soon as up, dust with air-slacked lime, to keep off the fly; thin if the plants become too much crowded. Keep those from cold-frames well hoed. The hoe-fork is excellent for this work. Kohlrabi is not so readily transplanted as the others, and it is better to sow the seed, when the crop is to stand, in rows 18 inches apart, and then thin to 8 or 10 inches. For early cabbages, Wakefield and Early York; medium, the Winningstadt, especially for poor soils; later, any of the Drumheads, and for family use the Savoy, though small, the best of all cabbages.

Carrots.—Treat the same as beets, but they need closer attention as to weeding, which should be done very early. Early Horn and Long Orange.

Celery.—Sow as directed last month; loosen the soil between the rows as soon as up, and pull weeds as soon as they appear. The same treatment is followed with Celeriac, or Turnip-rooted Celery.

Cress or Peppergrass.—Sow every 8 or 10 days.

Corn.—The time to plant is governed by locality. Darling's Early is one of the earliest, but not so good as many others, of which each locality has its favorite sort. In gardens, rows 4 feet apart, or more, for the tall sorts, are better than hills.

Cucumbers.—Plants started under glass may be put out as soon as the weather is warm. In most localities, it is soon enough to start seeds on sods. Plant in manured hills when the soil is warm, and use plenty of seed. Leave the main crop for pickles until next month. Early Russian and Cluster, earliest. White Spine the best for family or market.

Egg Plants.—Transplant when large enough to another hot-bed, or pot and keep under glass. Do not put out of doors until settled warm weather.

Herbs, sow. See article on page 182.

Leeks.—Sow, if not done. Weed as soon as up.

Lettuce.—The crop from wintered plants will now be ready for use or sale. Sow seeds for succession. Transplant when large enough 1 foot apart each way.

Martynia.—Sow when the soil gets well warmed.

Melons.—Treat in all respects like cucumbers.

Mustard.—Sow for salad or greens every 10 days.

Nasturtium.—When the soil is warm sow, and provide brush or other support for them to climb upon.

Okra.—Sow where it is to grow. Very tender, and is best left until June. Dwarf is best.

Onions.—See last month. Loosen the soil between the rows; keep clear of weeds from the start.

Parsley.—Sow in open ground. See last month.

Peas.—Put brush to the tall sorts, before they fall over. Earth up in hoeing. Sow late sorts.

Peppers or Capsicums in all respects like egg plants.

Potatoes.—Hoe as soon as up. Finish planting.

Radishes.—A constant supply will require sow-

ings at intervals of 10 days or 2 weeks. If insects trouble, sift on air slaked lime as soon as up.

Rhubarb.—Do not remove the leaves from plants set last fall or this spring. Older plants will now give a crop. Remove the leaves with a slight side-wise pull—never cut. Remove flower stalks.

Salsify or Oyster Plant is grown the same as carrots.

Spinach.—Sow as directed last month. Hoe and thin. New Zealand Spinach, valuable during the hot months, is a branching plant, and quite different from true spinach. Sow, and when large enough transplant to 3 feet each way in rich soil.

Sweet Potatoes.—See articles in this and April Nos.

Squashes.—The early sorts are managed the same as cucumbers. Out of door planting of late sorts must not be done too soon. Have the soil thoroughly enriched. Summer Crook-neck is best early.—Boston Marrow, Turban, Yokohama and Hubbard are all fine late. See Basket, page 163.

Tomatoes.—Transplant when danger of frost is over, 3 to 4 feet apart, according to richness of soil. In small gardens it conduces to neatness, and perhaps productiveness, to train the plants to some kind of trellis; on the large scale it will not pay.

Turnips.—Sow, and sift lime over young plants.

Winter Cherry.—This is called Strawberry Tomato. Excellent for preserves. Grown same as tomatoes.

General Management.—As soon as seeds germinate and the rows are visible, break the surface of the soil with a light scuffle hoe. Use the rake among recently set plants in preference to the hoe. A frequent raking, to destroy weeds as soon as they start from the seed, will save much hard work. Never let a weed go to seed. Have a handy, but out of sight, place to deposit rubbish—or rather two places: A pit for decomposable matter, weeds, without seeds, and all green stuff, and a heap for brush sticks, and old weeds—everything that can be converted into ashes. A deal of fertilizing matter will be ready next spring if everything is carefully saved.

Flower Garden and Lawn.

Greater success usually attend the planting of

Evergreens this month than in any other, and and screens, hedges and single trees will be largely planted. It seems trite to repeat so often, that success depends upon not allowing the roots to dry—yet we do it with emphasis. Get trees from the nearest available nursery; if near enough, go for them, get them dug, bring them home and plant them out on the same day—all the better if it is a damp one. If packed, great care must be taken of the roots. Plenty of damp moss must be used; some nurserymen claim that a ball of clay is best to preserve the roots. For the success of the rarer kinds, see our Horticultural Annual. Those useful, cheap, and to be had everywhere, the trees “for the million,” as the cant term is—Are Norway Spruce, Arbor Vitæ, Hemlock, Red Cedar, White Pine, Austrian Pine, and Scotch Pine. The first four are useful for hedges and screens, as well as to plant singly. The Norway, is the one tree for all purposes, whether for beauty, hardiness, ease of removal, or rapidity of growth. Hemlock, more graceful, but rather less easy to manage. Red Cedar, a rather slow grower, but fine for screens. See article in April, page 134. For low hedges, 2 to 3 feet apart is the proper distance for either. Never trim off the lower branches of an evergreen, they may be cut back at the sides or top, like any other trees. The pines are esteemed in the order in which we have named them. Price varies with the size. 50 cents each for trees for planting singly, down to 10 and 5 cents each, for small hedge plants. As these trees retain their leaves during winter, they convey an impression of hardiness that leads to their neglect. Cultivate near a hedge, or screen, as carefully as if it were a row of cabbages, and they will be much less slow, than they have the credit of being. When plants are well established, give an annual dressing of good compost, with a plenty of vegetable matter in it.

Deciduous Trees.—In cooler localities most ornamental, may still be set, as may

Flowering Shrubs.—We are sometimes asked to make selections of them, but when we do so, the list is so long, that we are afraid to publish it. Any thing that bears flowers, is better than no shrub. See page 184 for several white flowering ones.

Edgings.—Box should have been set last month. Thrift, Ivy, Stone-crop, and various others are used.

Annuals.—Sow hardy sorts at once, and tender ones near the end of the month. Set out those started under glass as soon as the weather is settled. Have a plenty of Asters and standard things, and don't rely upon novelties, but just try a few.

Perennials.—Have a seed bed for these, and weed and thin carefully. Sow seeds of those coming in bloom as soon as ripe. Transplant seedlings.

Bulbs.—Gladioluses, Japan Lilies, Tigridias, and others may be planted in warm rich soil.

Tuberoses.—Better buy bulbs that have been started in the green-house, as they flower before frost. Give a rich, warm place to secure early flowers.

Climbers.—Plant seeds of Sweet Pea, Cypress Vine, (first scalding,) Canary-bird flower, etc., and get Cobæa, Maurandia, Lophospermum, and “German Ivy,” (Senecio,) from the florists. Use these to hide unsightly fences and other objects.

Dahlias.—Set the roots in a spent hot bed and cover with soil, and when the buds have started divide so as to have a piece of root to each bud. Those who have no glass can set the roots in a warm exposure, and cover with a mat at night.

Lawns.—Mow as soon as the grass is long enough. Root up any coarse weeds. Roll frequently.

Roses will soon be attacked by their enemies. Hand picking will do a good deal, and whale oil soap for the slugs. No help for the rose bug but to shake him off, catch or kill. Turn potted roses into the border.

Bedding Plants are generally put out too soon. They are mostly tender, and should not be exposed to cold nights. Verbenas, Lantanas, Salvias, Geraniums, Gozantias, etc., may be used in abundance.

Green and Hot-Houses.

Judgment must be exercised in bringing out plants, and sudden changes avoided. Those pots that are not plunged should be sheltered from strong winds, and Camellias and the like shaded in part. A layer of coal ashes, upon which to place the pots, will prevent worms from getting in. Let the plants remaining in the house be shaded as needed. Bring out those things that have been wintered in the cellar and place in the borders.

Cactuses are splendid for verandahs, and for turning into the border, where they make a grand show.

Fuchsias, when planted out, need partial shade and to be well staked. A few specimens should be grown tall for out of door flowering.

Lantanas do not show half their beauty when grown as bedding plants. When trained as small trees nothing can be finer in the garden.

Cuttings of shrubs grown from green wood are to be made, as soon as the growth gets a little firm, to replace those overgrown from being put out.

Cold Grapery.

The vines, if not already started, should be put up as noticed last month. Warmth and moisture being under the control of the cultivator, the starting may be hastened or retarded. When growth has commenced, the temperature of the house may reach 85° at mid-day. Use the syringe to preserve a proper moisture in the air. Select the strongest shoots for fruiting, and rub out the rest.

Apiary in May.—Prepared by M. Quinby.

The readers of the *American Agriculturist* are scattered over so wide a range of country, that it will not be expected, that remarks applying to any one section, will serve for all. Bee keepers report the average quantity of honey on hand this year, compared with last, is not more than one pound in ten or twenty. Last year, all throughout the period of fruit blossoms, the weather was cold and windy,

and very unfavorable for the production of honey. Very many of the best stocks starved outright, from the 1st to the middle of June. Should the weather prove similar this year, ten times the number will starve, or need feeding. But the chances are that this year will be much better. A close watch must be kept continually of weather, bees, and honey. See directions in “Apiary” heretofore in regard to feeding. Feeding bees moderately at this season, just before, and immediately after fruit blossoms, is a good investment, although it may not be needed to prevent starving. The best brown sugar made into a syrup is probably the best and cheapest material for the present time. It will not be scented by robbers as readily as honey. Swarms, in some places, very much favored, may issue the last of this month. Italians are quite apt to swarm before they are expected to. Hives should be in order to receive them. As not over three or four swarms in a thousand will leave for the woods, without first clustering, it is not strange that many persons think they have compelled them to do, with tin kettle music, just what they would have instinctively done, without interference. Make no noise to quiet the swarms. When they leave, after clustering, it is often owing to bad management,—as allowing them to hang clustered too long, not getting all the bees to enter the hive, raising the hive too high from the bottom, leaving it in the hot sun, smell of new paint, etc.

Bees that swarm out naturally are quite as apt to divide nearly right as when artificial swarms are made. Yet, with the movable comb-frames, the divided colonies are so readily made equal, that I recommend artificial swarms whenever the master has the requisite skill to provide queens properly. A weak colony can be strengthened by giving it a comb or two well filled with sealed brood. After they have hatched, if not strong enough, give another. Strong stocks only pay. Artificial swarms are readily made as follows: First, have a queen ready; then be sure that your stock can spare a good swarm, and that the bees are getting honey. Operate in the middle of the day. Lift out combs till you find the one with the queen upon it, and put that, with the bees that adhere to it, into the new hive. Set it on the old stand, and the old hive on a new stand, at least 20 feet distant. All the old bees will adhere to the old place. The old hive will be nearly destitute of honey gatherers for a few days, but nurses enough will be left to mature the brood, and they will accept a mature queen two days after the removal, and in three or four weeks will be strong enough to divide again, having gained a good swarm by having a laying queen so soon after the old one was gone. If surplus honey is an object, instead of an increase of stocks, both old and young are in the best condition to produce it. Strong colonies are not destroyed by worms.

Carrying or Sending Money

Abroad.—Nearly all of the payments of money between distant points in our own country and between this and foreign countries, are made by a system of exchanges. One western man sends wheat, pork, etc., to New York, and makes a draft upon it. Another buys goods in New York, and sends a draft for the pay. These drafts are exchanged or balanced by banks and bankers at the two points, and only money enough is sent either way to pay, from time to time, the difference between the aggregate amounts of the drafts or indebtedness. So with our foreign trade; we send abroad cotton, grain, etc., and buy manufactured articles and other things, and only gold enough goes across the ocean to balance accounts.—A person going abroad does not want to carry all the money he may need there. He therefore buys a “Draft” on London or Paris, which is cashed on presentation and identification; or he deposits the money here, and takes a “Letter of Credit” for \$250 in gold or any higher sum, and then draws the money as he needs it; or he buys “Circular Notes,” of \$25 to \$100 each, which are good at almost any point. Messrs. Duncan, Sherman & Co. have “correspondents” or agencies in more than 800 different cities or towns in Europe and elsewhere in foreign countries, any one of whom will cash their Circular Notes or Letters of Credit. We found these very convenient when abroad, as we obtained any sum at any point by calling at their agency, and received it in the currency of the country we happened to be in. Their business card will be found in our advertising columns.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month, ending April 15, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days this month	151,000	159,000	141,000	3,800	51,000	51,000
22 days last month	111,000	94,000	139,000	15,000	47,500	76,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.
26 days this month	278,000	1,040,000	2,914,000	596,000	709,000
22 days last month	164,500	1,565,000	236,000	516,000	928,000

2. Comparison with same period at this time last year.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days 1867.....	154,000	159,000	141,000	3,800	51,000	51,000

1865.....353,290	155,701	129,749	141	24,302

Gold has fluctuated considerably during the month. The extremes have been 132½ and 133½. The warlike news from Europe has been the main cause of the rise. The latest advices thence have been of a more pacific tenor, and the drift of gold has been downward. The price on Monday, the 15th of April, was 133.... Breadstuffs have been in much more demand, for home use, shipment, and on speculative account, and, with light receipts, prices have favored sellers decidedly. The most active foreign call has been for corn, which has been quite excited and variable through the month. The milling demand has been good at buoyant rates. Rye has advanced materially. Barley has been almost out of season. There have been considerable arrivals of flour and wheat from California during the month, which have met with a more ready market at more remunerative prices. Our millers have about overcome their prejudices against California wheat, and are buying quite freely at the highest ruling prices.... There has been a fair degree of activity in provisions, at, however, irregular prices, most articles in the line closing heavily.... Cotton has been

decidedly depressed, by liberal receipts, and adverse foreign news. The demand for it has been quite moderate.... Wool has been rather lightly dealt in at the improved prices noticed in our last.... In other agricultural products business has been restricted, and prices have been unsettled.

CURRENT WHOLESALE PRICES.

The Lenten season extending over the past four weeks has diminished the consumption of beef, so that the supply, though moderate, has generally been equal to the demand.... **Beef Cattle** were a little higher the first of April, and remain a trifle above our previous quotations, the present rates being equivalent to 17½c. @ 18c. 40 lb., dressed weight, for the few of the best or extra cattle; 16½c. @ 17½c. for first quality; 16c. @ 15c. for medium grades, and 14c. @ 12½c. for inferior to very poor....

Milk Cows are very slow of sale now, and it does not pay to send them here. Very good cows seldom bring over \$75 @ \$80, calf included, though occasional extra or fancy cows sell at \$90 @ \$100 and upward; common to poor range from \$70 to \$50, according to quality.

.... **Veal Calves** are coming in freely, live, and "hog-dressed," that is, with head, feet, and entrails removed, but the skin left on most of the carcass. Live range from 12c. 40 lb. live weight, for the best or extras, down to 7c. for the worst.... **Sheep and Lambs** have not been very plentiful, but prices are a little lower than one month ago, the latest sales being at 9½c. @ 10c. 40 lb. live weight for extras, 9c. @ 9½c. for first quality, and from that down to 7c. @ 7½c. for poor. Some sheared sheep, and a few lambs have appeared, but not in quantity enough to establish a price.... **Live Hogs** have been abundant for the demand, most of the time, and prices have not varied much during a month; the latest sales range between 7½c. @ 8c. 40 lb. live weight, for good, and 7c. @ 6½c. for poor, rough lots.

Take Notice! — All Subscriptions begin with the Volume, unless otherwise desired and specified when subscribing. All subscriptions received up to June 15th are entered down for the entire volume, and the numbers from January 1st are forwarded. We keep on hand, or print from our electrotype plates, as needed, the entire numbers of the volume, to supply to

new subscribers, and to others desiring them. Subscriptions received after June 15th, begin at the middle of the volume, unless otherwise desired or specified.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Good Half Dollar Easily Earned.

The special premiums offered by the Publishers on page 165, are worthy of attention. The *Annals* are richly worth their price, (50 cents), and almost everybody can each find at least one more who may, with a little explanation, be convinced that it will be for his or her interest and profit to take the *Agriculturist* for the present year.—The *Annals* are not only useful now, but they will grow increasingly so from year to year as the series goes on. It is designed to make these works so beautiful and valuable that they will be indispensable to every family.

We Commend the Experience of a Subscriber, as detailed under the head "Two Months" on page 165, to the attention of others. What one man has done, many others can do.

Answers to Correspondents.—We are not under obligations to answer any questions, but being rather good-natured, we prefer to do it, and do it when we can, and it is a pleasure to assist our friends when it is possible to do so. Many letters go unanswered for various reasons, and the great numbers to which we do reply are written by the editors, away from the office in time that properly belongs to them for other uses. When one writes us a letter upon a matter that is solely for his own benefit, and in a few days after demands "an explanation" why his first is unanswered, we submit that it is pushing good nature. Will our friends understand that we answer all that we can as fast as we can, and that no one is willingly neglected. We show some preferences though: a letter with prepaid postage is likely to be taken up before an unpaid one. Inquiries, where to buy seeds, plants, or any other thing already advertised in our columns, are not answered. Inquiries, about "doctors," are not answered. Those who ask us questions involving the writing of a full volume in reply—like a Brooklyn correspondent who asks us to write to him directions to propagate and cultivate small fruits—we must pass by. Those who ask advice in matters totally unconnected with the objects of our paper—such as desiring us to advocate the construction of a certain railroad, etc., must go unanswered, as must requests for seeds, grafts, and the like. With a hundred letters before him, all reasonable persons will see that one must make some discrimination. Do not send more than money or stamps enough to cover the return postage—it only makes us trouble; and we can't be hired for 25 cents to write a letter. So much for replies by mail.

As to replies in the paper: the first choice is for those of general interest. Next, those that have but one subject. Don't mix Agriculture, Horticulture, Household, etc., all on one page—at least separate them by a space so that they can be cut apart and distributed to the editors.

Again, please always put the name on the letter, which will not be used if some other signature or initials are given. It often happens, that inquiries are made which are of interest to the writer and to no one else—such as those in a Taunton, Mass., letter, inquiring about distinguished botanists and others. We have not space for such matters in the paper, but would gladly reply by letter did we know the writer's address, which is not given.

N. B.—A great many letters are answered in the "Notes about Work." All the necessary points in about fifty letters are covered in this way in the present issue. We try to have these in mind in making up this portion of the paper, which is always newly written. Continue to ask us questions, then, and believe that no sensible one is unconsidered or neglected because there is no personal answer by "return mail," or in "next month's Basket." We cannot write on every subject in every paper,

Great Sale of Duchesse and Oxford

Shorthorns.—Mr. Samuel Thorn, of Thorndale, Duchesse Co., N. Y., has recently sold to Mr. James O. Sheldon, of Geneva, N. Y., his entire herd of Shorthorns, with the exception of two bulls, the 6th and 12th Dukes of Thorndale. This sale is the largest ever made of animals of the Oxford-Duchesse tribe, the number sold, old and young, being 40, and the average price paid \$1,000 a head. Mr. Thorne's reputation as a careful, discreet, and successful breeder, is known wherever this most favorite family of Shorthorns, (the Duchesses), is admired, and in the regard of both American and English breeders, this

herd has long stood foremost among those of American Shorthorns. Mr. Sheldon has been for some years forming a herd of Duchesse of Oxfords, which bears a most excellent reputation, and with this addition to it, becomes the owner of more fine animals of these families than any other breeder in the world.

Osage Orange.—An article on this was crowded out. In brief we can answer many questions about starting the plants.—Soak the seeds 5 or 6 days in blood-warm water, changing each day. Don't cook the seeds, as our Delaware friend did. Then keep the seeds damp, and in a warm place, until they sprout, stirring now and then to prevent heating. Sow in well prepared soil; rows, a foot apart; cover an inch deep and roll; keep well weeded, and thin where too crowded.

A Good Repeating Shot-gun.—This, long a desideratum, seems now to have been accomplished, and the favorite double-barreled fowling piece seems to be doomed. This engraving represents *Roper's Repeating Shot-gun*, manufactured at Amherst, Mass., under the supervision of Mr. C. M. Spencer, whose name is world-famous as the inventor of the repeating rifle, the terrible seven-shooter of our mounted riflemen. This gun is light and handy, very neatly made, strong and accurate, as we judge from careful inspection, and from examination of several sheets of paper, shot at, at different distances. Metallic cartridges, using the common cap, are loaded before hand and inserted, four at a time in the magazine. The cartridge cases are light, of steel, and may be used many times without perceptible wear, and a large number, ready charged, be conveniently carried.

American Pomology — Apples.

Doctor Warder's book is now before the public, and will receive the attention it deserves. It is in fact the only work where the newer fruits can be found, and will mark an era in pomological literature, in importance second only to the appearance of Downing's work, over 30 years ago. The catalogue of all the recorded varieties occupies 26 pages, and condenses a wonderful amount of information in a very small space. One can see at a glance the origin, shape, color, quality, season, etc., of any of the many hundreds of apples there enumerated. We trust that the work will meet with a welcome that will encourage its author to bring out his vast accumulation of materials upon other fruits at once. A handsome volume of 744 pages. By mail \$3.

Sundry Humbugs.

—Since our last we have received about 200 letters from different parts of the country with swindling schemes and circulars, and accounts of impositions and cheating by the humbug operators. Many of these refer to parties described in this journal last month and previously. Others are concerning parties who have merely changed their places and names. Very many of these letters ask responses by mail, but the number is so large that it is out of the question to write to the half of them. Some ask the return of tickets, &c., that they have previously forwarded; but this is not practicable. We have thousands of such tickets, and cannot afford time to hunt up any particular man's document, unless it be of special importance. Look for our exposures in past numbers before writing. Remember that if we do not reply to any inquiry, either by letter or in a following number, it is an indication that the parties inquired about are either swindlers, or at best of doubtful character. This response must answer for many letters asking replies, but which we cannot take time to respond to by letter. We mention a few new names, reserving others for more time and room than we now have, and others for further investigation. We say, unhesitatingly, that, without exception, every "gift enterprise" now before the country is a fraud, and that the investors in them will find it so in 9,999 cases out of every 10,000. We have accounts of more than fifty such gift enterprises now under way in various places. The soldiers', widows' and orphans' "sympathy schemes" are by far the most numerous. They literally "steal the livings of heaven to serve the devil"—that is their own pockets. *A. D. Bowman & Co.*, (Van Allen), we refer to here, not to pronounce them humbugs, but to say the use of Mr. Judd's name on their circulars as reference was wholly unauthorized, and would have been refused if asked for. Mr. J. does not indorse anything which he has not examined with the greatest care, and even then he aims to avoid being annoyed with a multitude of letters of inquiry as to the genuineness of any and every claimed indorsement, by refusing his signature.—The "ink powder" was submitted by us to a good chemist, and reported "to answer for common writing purposes, but not

permanent in its character," and his advertisement was therefore declined.... "Albany." — We publish a multiplicity of names of swindlers, but the operators are comparatively few in number, and they change their "business" firms and names at convenience, and often run several names and places at the same time. In our calls upon the swindling gentry in various disguises, personally and by proxy, the same individual will on successive days turn up in several localities. For illustration, an old post-office clerk, whose real name is, or was, Thomas Fletcher, afterwards was employed in a provost marshal's office; again he appeared as "Whitman & Co."; anon as D. H. Kellum & Co., etc., etc. After having tried various other names until they became too well known, he lately took up his own again.... *A Masonic Gift Scheme.*—Geo. W. Holmes & Co., are trying to persuade all good Masons to send them \$300,000 for as many tickets, promising chances at \$10 silk hats, \$75 plated tea sets, \$1,500 pianos, \$22,000 house, etc., etc., reckoned at \$200,000 in all, and costing perhaps half as much. They don't tell how much is to go to a "Hall and Asylum fund," and leave the "time and place of distribution to be hereafter named." No intelligent Mason will bite at this bait.... *Nursery Gift.*—Smith Whittier, dating at Chicago, says he has "lost the head of his family," (he ought to lose his own head,) and wants 50,000 farmers and others to console him by sending in \$100,000 at \$2 each, and promises to give them a chance—a fifty-thousandth chance—to draw his wonderful fruit farm of 34 acres, somewhere in St. Joseph, Mich.—he don't tell exactly where. Plenty of other widowers would like a similar consolation. Go to digging, Smith Whittier, and not try to humbug honest people out of their hard earned dollars by your big picture and great promises. *Sam'l Bechtold & Co.*, of Philadelphia, ask people to send them \$2 each for a soldiers' orphans' home, offering in return \$2 pictures, and a bonus of about half a million dollars worth of gifts. That may do to catch very "green-horns," but not anybody else. Before investing for charity's sake, better write to Jay Cooke & Co., and ask them if the reference to Geo. A. Cooke is allowed, or worth anything if allowed....

Of Gift Enterprises, the meanest are those that solicit patronage ostensibly to aid soldiers, or their widows, and orphans. A score or more of them are now operating. Among others, Tudor, Gates & Co., of Mulberry, O., *alias* Cincinnati, give the pretended full indorsement of Governors, members of Congress, etc. None but very foolish people will pay \$1 for one chance in 300,000 of drawing a valuable prize, even if sure that \$256,000 worth is to be drawn for. When one wishes to aid soldiers and their families, better send the whole money to responsible parties, and not let the ticket operators pocket three-fourths or nine-tenths of the money paid in to them.... The "Nassau Association" offer 12 silver spoons for \$3 in currency, and to throw in gift tickets for watches and other articles, "marked" from \$250.00 to \$2.00 each. Very tiny silver spoons they would be at \$3 for 12, to say nothing of the "gifts." Lead spoons, very thinly plated with silver, can be bought for a trifle, and are worth no more. Where do the green-horns live who keep such enterprises going?.... *Lotteries.*—T. J. Furniss, of Cedar street, New York, like many others, pretends to assure a great many people of his ability to send them valuable prizes. Let everybody having an itching to try these fellows, remember, 1st, that if they can pick out lucky numbers, then the whole lottery is in every way a swindle, and you will be surely swindled; 2d, that if conducted fairly the pretended agent is a liar, and will cheat you; 3d, that if he had the ability to select lucky numbers, he would surely keep them himself, for he would make far more than by the commissions he could hope for from any customers you could possibly send; 4th, that at least nine in every ten of these lottery "agents" keep every dime sent them, and you can never find them or get a word from them; and, finally, that all lotteries are unfair swindles, however regularly conducted, because of every \$5 paid in, the managers and agents pocket from \$3 to \$4, and leave only \$1 to \$2 to be drawn for by the tickets. *Frank, Mass & Co.*, *William-st.*, and *J. E. Brennan & Co.*, *Nassau-st.*, are match swindlers with T. J. Furniss.... *Beware of New Tea Companies.* The so-called "Great American Tea Company," 31 & 33 Vesey st., advertised in our columns, though doing an immense business all over the country, has not even been complained of to us more than two or three times in as many years. On this account, as well as for other reasons we have previously stated, we believe general satisfaction is given to their customers. But stimulated by their success, several of the swindling fraternity have started or pretend to have started other "Tea Companies,"—some copying very nearly the advertisements, etc., of the old company. Some of these we know to be humbugs, (one was noted last month,) and as to others we have not evidence sufficient to warrant us in admitting their advertisements.... Every man offering watches, jewelry, etc., by ticket is to be carefully avoided. Nine out of ten of the most plausible of these fellows will send nothing for your money, and not one

in a hundred will give you your money's worth.... Every stealer of morals, modesty, and virtue, will be quite likely to steal your money if sent to him. These fellows know you will not make a fuss about money sent for immodest or immoral books and instruments, and they will keep it and send nothing, unless pretty sure of making a bigger haul afterwards.... *Plants, etc.*—Don't spend your money, time, and soil, on any of the wonderful foreign corns, seeds, plants, etc., that just now turns up exclusively in the hands of some one individual. Egyptian corn, Dourah corn, etc., which were tried and condemned years ago, are "up" for speculation again.... Want of space compels us to stop here, leaving about 50 letters unanswered—but they are all humbugs, so don't be troubled about losing some great money making chance.... See last month's exposures for sundry names in these letters.... *P. S.*—*Harris Brothers*, of Boston, received something towards their just deserts in the Superior Court on April 15th, viz.: a fine of \$14,000 (\$7000 each).—Good for Boston: Now let N. Y. City take hold of her lottery and "gift enterprise" swindlers.

Mr. Judd not an Office-Seeker.

The following appeared in a New York daily morning paper on April 4th: "OFFICE SEEKERS.—The halls and ante-rooms of the Executive Mansion were literally blocked to-day by the crowds of office-seekers. The crowd exceeded anything of the kind for months past. The President was almost exhausted by 3 p. m., and not one-third had obtained interviews. Orange Judd, the publisher of the *Agriculturist*, and Horace Capron, of Illinois, are prominent candidates for the position of Commissioner of Agriculture. The President is determined to remove Newton."—Similar telegrams have appeared in many other journals. From the above, it would appear that Mr. Judd was one of the "crowd" of candidates knocking at the Presidential door for office. We take the liberty to say that so far from this being the case, he was quietly at home looking after his gardeners and builders, and entirely ignorant of any efforts making, or to be made by anybody, to get him into office, *volens volens*. The *Agriculturist* "Office," with its half million of patrons and friends, is abundantly satisfactory so far as position, usefulness, and pay are concerned. In short, he is not an aspirant to any Government office.

Worse than Humbug.

—The Murder of the unborn, is beginning to attract, in some degree, the attention which its great importance imperatively demands. The prevalence and recent great increase of this crime, the general ignorance as to its criminality, and of its terrible consequences upon the guilty actors themselves, forbid longer silence on the part of medical men, ministers and editors, who have until now feared lest public effort should make known and increase an evil which it aimed to diminish. Dr. Storer's Essay, "Why Not," published by Messrs. Lee & Shepard, of Boston, should be in the hands of every Physician, Clergyman, Editor, and of all other intelligent persons of either sex, in the country. (Price 50 cts.) Dr. Todd recently furnished an article on the subject to the *Congregationalist*, at Boston, and we hear he is preparing a longer essay for publication. The *Christian Advocate*, of New York, also published an article from an intelligent lady, entitled: "Fashionable Murder." The *Northwestern Christian Advocate*, of Chicago, Ill., of March 13, devoted 7½ editorial columns to a bold and outspoken discussion of the subject, which is being copied at the West, and is worthily awakening much attention. We learn that one of the editors, Rev. Arthur Edwards, Chicago, is preparing a cheap Pamphlet or Tract designed for extensive circulation. We wrote somewhat sharply on one phase of the subject—the medical advertisements—in May, last year, and we are very glad to see these further efforts to check a wide spread, growing, and terrible evil—crime! It behooves every woman—every man indeed—to become enlightened upon this subject.—What shall we say of those journals, even such papers as claim and find admission into the best families, that yet, for the sake of the money consideration, daily spread before their readers the advertisements of such monsters—such murderers—as Restell, Mauriceau, and many others, who offer their services and medicines to all, married and unmarried, and promise for a small consideration to assist them not only to the most criminal deeds, but to the almost certain destruction of their own future health and happiness—very often of their lives. If the publishers of such journals lack the conscience or the intelligence required to reject these advertisements, their sheets should be banished from the household by every one who would not nurse a viper in his domestic circle.—An editor, with whom we recently remonstrated, excused himself by pleading ignorance of the character of an advertisement. Any editor, so simple or ignorant as not to know the intent of advertisements "to remove irregularities from whatever cause," "monthly pills," etc., and the like, has woefully mistaken his calling as an enlightener of the public.

Small Wooden Boxes for Butter.

—W. B. Guernsey, of Norwich, N. Y., has brought to our notice an apparently excellent device for marketing butter in small packages. Two round boxes of equal height, made of maple veneer with maple heads, very light and strong, fit together almost air-tight, one forming the box, the other the cover. They are protected by a tasteless inodorous varnish, and butter, being packed in them when made, and filling them completely, is said to keep as well or better than in firkins; and the cost is about the same, pound for pound. These, if they will work, will afford a most profitable means for marketing butter, both for the producer and consumer. We shall test and report.

A Winter of Snows.—

Wishing to preserve some record of the remarkable winter just past, we requested Prof. O. W. Morris, of the Deaf and Dumb Asylum, N. Y., to give us the data. Prof. M. is an accurate meteorological observer, and has charge of one of the stations of the Smithsonian Institute:—"Farmers generally predict good crops when the snow falls early, and the ground is covered by it during the winter, whether the same snow continues or melts, and is followed by other falls. The ground has been covered nearly all the time since the first of any depth came, and it had suffered but little from freezing and thawing. The popular saying, 'That there will be as many snow storms as the date indicated in the month when the first falls,' is not borne out in this winter, for it first fell on the 23d November, and there have been 26 distinct times when snow has fallen. The quantity is very much more than common, as the aggregate is 6 feet and 10 inches. The weather for this latitude has also been unusually cold, the thermometer on one morning fell to 13 degrees below zero, and a longer continuance of cold weather also; for, in Jan., there were 17 mornings that the thermometer was below freezing point. We have also had very high winds, doing much damage on the sea, and also on the land. Last year, our first thunder storm occurred on the 21st April; but this year, we had very heavy thunder and vivid lightning on the 2d of February, and again on the 9th."

Hydraulic Rams deliver at usual heights about one-seventh to one-eighth the amount of water required to run them. They cost from \$8 (for a ram adapted to a brook furnishing 3 quarts to 2 gallons of water per minute—having a $\frac{3}{4}$ -inch drive-pipe, and $\frac{3}{4}$ -inch discharge), to \$150, (for one adapted to a flow of 25 to 75 gallons per minute, having a 4-inch drive-pipe and 2-inch discharge). Water rams are applied to raising water for the purposes of supplying dwellings and stock-yards, gardens, etc.; for irrigation, ornamental fountains, etc., etc., and when well set, require little care. They may be supplied by plumbers generally; Douglas' is esteemed.

The American Pomological Society.

—We have space for only the following portions of the circular:—"The undersigned give notice that its Eleventh Session will commence in the City of St. Louis, Mo., on Wednesday, Sept. 11th, at 11 o'clock, A. M., at Mercantile Library Hall, and will continue several days. All Horticultural, Pomological, Agricultural, and other kindred institutions in the United States and British Provinces, are invited to send delegations as large as they may deem expedient; and all other persons interested in the cultivation of fruits are invited to be present and take seats in the Convention.

Among the prominent subjects which will come before the Society at this session, will be that of the revision of the Society's Catalogue of Fruits. The several State Pomological and Horticultural Associations are requested to compile lists for their own States or Districts, and forward them, at as early a day as possible, to P. Barry, of Rochester, N. Y., Chairman of the Committee on the Revision of the Catalogue.

Members and delegates are requested to contribute specimens of the fruits of their respective districts, and to communicate in regard to them whatever may aid in promoting the objects of the Society and the science of American Pomology; and as the fruits of the South and Southwest will then have attained their size, it is desirable that a grand display from these sections be made.

Each contributor is requested to come prepared with a complete list of his collection, and to present the same with his fruits, that a report of all the varieties entered may be submitted to the meeting as soon as practicable.

Packages of fruits, with the name of the contributor, may be addressed as follows: "American Pomological Society," care of C. M. Saxton, corner Fifth and Walnut Streets, St. Louis, Mo. MARSHALL P. WILDER, Pres't.

JAMES VICK, Sec'y.

Still Another.—New Agricultural papers multiply so rapidly of late that we can hardly keep the run of them. The latest accession to the ranks is the *New England Homestead*, a 16 page monthly, published by Henry M. Bart & Co., at Northampton, Mass. A talking title, and a good looking and cleverly edited sheet,

The editors in their first issue show a virtue that we commend to others much longer in the harness—when they quote, they give full credit for articles taken from other journals. It starts with our good wishes.

Showers of Brimstone.—

C. Wade, of Todd County, Kentucky, sends a sample of a yellow substance that fell with a rain on the 11th of March. It is a pale, sulphur colored powder, and its appearance somewhat alarmed some persons, though Mr. W. rightly conjectures that it is the pollen of some kind of a flower. A glance at a portion under the microscope at once showed it to be the pollen of some pine. As this pollen is of a very peculiar shape, we give an illustration of its appearance under the microscope. It must be very early for the pines to be in blossom in Kentucky, and it would be interesting to know how far the winds had carried it. This phenomenon has been noticed many times before. Many years ago a copious shower of it fell in Troy, N. Y., and caused great alarm among a certain class. Showers of brimstone, blood, and the like, soon lose their mystery under the microscope.

The American Fruit Culturist, by

John J. Thomas; New York: William Wood & Co.—There are a few people—just a few—whose writings we feel safe in recommending, without even seeing them, and John J. Thomas is one of these. But we think too highly of the author to pass his book by without an examination, and after a perusal we are able to commend it as one of the most useful of the recent additions to horticultural literature. Many horticultural books are ground out by the job, but this is not of that kind; the author knows just what he is writing about, and puts that knowledge in so plain and pleasant a way that others can benefit by it. As the scope of the book includes all kinds of fruit, the author does not attempt too much with any, but gives the leading varieties of each, and directions for their propagation and culture. The book contains 511 pages, produced in handsome style, and liberally illustrated. We can send it by mail, at publishers' price—\$3.

Gravel-wall (Concrete) Houses—

Gables.—Aliquis will find no difficulty in putting up gables of concrete, if he will make large bricks, the width of the wall and twice as long, of the concrete, and lay them up like a flight of steps on each side. They may be made rectangular or with one end beveled at the desired angle for the roof. The wall between them may be laid up in concrete the same as the walls of the building.

The Roller Whimtree—illustrated herewith, is a simple and effective device for preventing injury to trees, when plowing among them. Its working can be readily seen by the figure. It is patented by a subscriber to the *American Agriculturist*.

Dog Law in Connecticut.—

A correspondent informs us, that the dog law in the above state has been perfected so as to apply to the whole state without reference to town action. Dogs are registered, taxed, collared, and watched by select men. Outlawed dogs given over to death. Good, we are glad to hear it. Three cheers for the Nutmeg State, if she will only live up to the law.

Plastering vs. Weather-boarding.

—J. R. Chambers. If the plaster be made of cement, and good, clean, sharp sand, it will last for ages. Brick and stone buildings are finished in this way, and stand the weather. The American Building Block Company put up the walls of large buildings with an artificial stone, made of cement, sand and lime. Consult a builder.

A Strawberry Exhibition will be

held by the American Institute in New York in June—time not yet fixed. Liberal premiums are offered and a large show expected. Another will be held in Pittsburgh, Pa., by Mr. Knox on June 12th and 13th, on which occasion we are sure that at least "700 Strawberries" can be seen.

Poultry Matters.—

We have certainly been growing careless in neglecting poultry in this country. The prizes of our Agricultural Societies are given freely to unworthy subjects, and ignorance of their business is the rule and not the exception among poultry breeders;

real "fanciers" are rare, while those who take a fancy to keep a certain kind or kinds of poultry, do so for a year or two and then neglect them. Worcester, Mass., sustains the only Poultry Club in the country; there may be others, but they are very quiet. Poultry fanciers are those who breed, not for the sake of multiplying poultry, but for securing perfection in points of purity and excellence, and for improving upon the various breeds now known, and who are on the alert to introduce new and improved breeds. Such persons gain much by being associated, and we would be very glad to chronicle the formation of a

New York Poultry Club, which the following letter from an enthusiastic poultry breeder suggests:

Messrs. Editors:—Noticing an editorial suggestion in the *American Agriculturist*, in reference to a poultry club, I wish you would again call attention to the matter. It seems hardly creditable to our great metropolis and neighboring cities that there is no association of the kind. Thousands of persons residing within fifty miles of the city are interested in poultry, and if these will only take an active interest in forming a club, it may be made not only a pleasure but a benefit to every one connected with it. We certainly need such a club here, and I, for one, will do all I can to further the object. Will any of your readers assist? If so, I hope to hear from them.

Yours, A. M. HALSTED, 68 Pearl street.

Importations.—A number of our prominent poultry fanciers have been importing from England, France and Belgium quite extensively of late. Since the list published in the *American Agricultural Annual* was prepared, we hear of importations by Mr. Halsted, above named, of Crevecoeur, Hondan and La Fleche fowls; by Mr. Benj. Haines, Jr., of Elizabeth, N. J., of Crevecoeur, Golden-Pencilled and Silver-Spangled Hamburg, Gray and White Dorking, Silver-Pencilled and Black Poland, Golden and Silver Seabright, Game and Black African Bantam, and Black Spanish fowls, besides Rouen and Aylesbury Ducks; by Mrs. Saunders, Brahma, Cochins, Gray Dorking, Hondan and Crevecoeur fowls, Toulouse Geese and Aylesbury Ducks; by Capt. Singleton, Dark Brahma and Cochins China fowls.

A New Corn Dropper.—

A subscriber sends the following: Boys and men in dropping corn often drop 20 or more grains where 5 only are needed. I propose to obviate this by fastening a small cup, holding 5 or 6 grains, on the thumb, and a flat piece on the fingers of a glove or mitten, as shown in the illustration. This is, of course, for planting on the small scale only. Unpatented.

Angora or Cashmere Goats,

Fleeces, etc.—We have many inquiries in regard to these interesting animals and their beautiful, silky fleeces, and shall endeavor to satisfy our readers as soon as we can satisfy ourselves. The animals are the subject of wild speculation at present, and what their economical value will be, when people sober down, it is hard to say. This much is certain: They are as hardy and easy to keep, probably as mischievous also, and may be made to yield as good milk, with proper selection and breeding, as the common milking goat. They have not, it is said, so strong an odor, and their flesh is claimed to be superior,—these two propositions we will not vouch for. Their fleeces vary greatly in length and fineness. They are wonderfully silky and beautiful,—and just now fringes and tassels made from them are very fashionable. The hair, or wool, takes color easily, and may be woven into beautiful and durable fabrics. The demand now is chiefly for fancy-work, fringes, tassels, etc., and for the skins for muffs, tippets, and capes for ladies. The fleece is said to sell, in New York, Lowell, and wherever there is a demand, for \$1 to \$4 per pound, according to quality, but so far as we can learn, the demand is uncertain. We are glad to know that efforts are being made to introduce a stock of the very best animals that can be purchased in Asia, and also to introduce looms and foreign weavers.

To Bring up Sandy Land.—

"J. C. M." You have no clay, can get muck, and any "hand manures" which can be bought in New York market. Your best plan would probably be to cart muck as soon as the roads are settled; use this to increase your manure heaps, compost it with shell lime, 10 bushels to the cord, plant corn with the manure compost, potatoes with the lime compost, with plaster and ashes when they first come up. Plow other land and sow 100 to 150 weight of Peruvian guano, to the acre; sow huckwheat and plow it in when in full blossom with a flat furrow; then put on 50 bushels of lime to the acre, harrow, and sow huckwheat again, (if before the first of August, sow corn or sorghum), and plow under as soon as growth is checked by the frost. Clover will probably not take well on the soil now, but may be used as a green manure crop after this treatment, or on land after manuring and taking off a corn or other crop.

Going to Paris, London, etc.—Several subscribers in different parts of the country have from time to time asked about the methods and expenses of getting to the Exhibition at Paris this summer. There are many steamers advertised, but it is hardly in our line to go into particulars. In remembrance, however, of a most delightful voyage in the world-renowned "Great Eastern," in 1862, without the least sea-sickness or other discomfort, we can commend a voyage in her as a most desirable thing. This Leviathan of the deep has even been greatly improved (not "enlarged," as editors say), and will leave New York for Brest May 28 and July 9. (For circulars, etc., address Wells & Fargo's Express Company, New York City.) A railway extends through a beautiful part of France from Brest to Paris. First class fares to Brest are \$100, \$125 and \$140 each in gold—the different rates depending upon the size and location of state rooms. This fare includes all necessary expense on ship-board. Railroad fare from Brest to Paris \$7.50. This makes the trip to Paris, at present prices of gold, about \$144, or \$178, or \$200 in our currency. One may allow about \$5 a day in Paris for expenses, sight seeing, riding, etc., or \$100 for twenty days. The round trip will therefore cost from \$400 to \$500 currency, according to style of going, extras, etc. A \$100 or more, taken along to use in purchases, etc., if desired, will not come amiss. —When in Paris, one will want to run over to London, which can be done by several routes, in 14 to 16 hours, and for \$6 to \$8 in gold, according to the route and accommodations chosen. As much more will take one up through the heart of England to Liverpool.—Another very pleasant, short trip, for one pressed for time, is to go from Paris to Lyons; thence to Geneva, Switzerland—a romantic ride up into or among the Alps—; thence to Frankfort, Germany, diverging to Strasburg if time serves; thence to Mayence; thence down the most interesting portion of the Rhine by steamer to Cologne; thence to Brussels; thence to Paris, or to London *via* Ostend. We give partly from memory, and partly from our notes made in passing over portions of the route in 1862, an approximate table of the distances, first and second class fares (the latter about equal to our first class cars), in gold, and the through time by express trains, not allowing for stopping to rest or for sight seeing. Starting from Paris:

PARIS	Miles.	Hours.	1st Class.	2d Class.
To Lyons.....	316	11	\$11.00	\$8.00
To Geneva.....	100	5	3.50	2.50
To Frankfort.....	313	16	9.00	6.50
To Mayence.....	21	1	80	50
To Cologne.....	127	10	2.00	1.50
To Brussels.....	150	8	5.00	4.00
To Paris.....	215	10	7.00	5.50
Or to London...	240	11	10.00	7.50

Slow Torture at the Stack.—An "Iowa Farmer" should cypher on the problem of the cost of fattening steers in the field rather than in the barn in the winter. One third of the food at least goes to keep up animal heat, and is wasted. Corn is cheap in Iowa, but is it cheaper than boards? In the East, store cattle and cows have little to eat except corn stalks, straw and hay, and this often of poor quality. If kept at the stack through the winter, they grow poor and suffer.

Fence Posts.—H. T. Lake, Portage Co., O. We know nothing better to preserve posts than to dip the butts in hot coal tar, let them drip, and then roll in sand.

What Manures shall We Buy?—"J. M." Peruvian guano, at present prices, is out of the reach of most cultivators, and yet it is so reliable, and so certain to produce immediate results, that some will buy it at any price. Superphosphate of lime is always good for certain crops, if you get a genuine article, and for this you have to rely upon the integrity of the manufacturer. Bone dust is in the same category. The cheapest manures in the market, this spring, we think, are the fish guanos, or the dried pumace from the fish-oil factories. These are of two kinds, the refuse as it comes from the press, deprived of all the oil, and the refuse still further dried and ground to a coarse powder, so that it can be sown in drills or broadcast. The latter involves considerable more labor in its preparation, and stands higher in the market. It has about 9 per cent. of ammonia. It is better for certain purposes; is more conveniently applied either in the hill or to growing crops, and can be more evenly distributed upon the surface for harrowing or plowing in. The inground refuse is lumpy, and needs to be mixed with large quantities of turf, loam, peat, or muck in compost, and to be thoroughly worked over, in order to use it economically. We have used both varieties with excellent results, and at present prices, we think we get more fertilizing material, for the money, in fish guano than in any other article in the market. The market is generally at the factories, and, for the most part, the article is kept in first bands for sale; so that there is not much chance for adulteration without detection. Until quite recently the local demand has taken it up about as fast as made. The fish-oil factories are increasing, and as the refuse

multiplies, it has to go further from home for a market. It is coming into use on the cotton plantations, and wherever it is fairly tried the demand for the article increases.

The Price of Farm Labor—as given in the Monthly Report of the Agricultural Department is: In the Eastern States \$33.30 per month; in the Middle States, \$30.07 per month; in the Western States, \$28.91; in the Southern States, \$16.00; in Oregon, \$35.75; in California, \$45.71. In Massachusetts the price is \$38.94 per month, which is higher than in any other State except California. This is attributed to the great variety of industry in the State, only about one-fourth of the people being employed in agriculture. This makes a very lively demand for all farm products. The greater variety of occupations in a State the better for laborers. There has been an advance in the price of labor of about seventy per cent. in the last forty years, notwithstanding an immigration of 5,000,000 of people. The greatest want of the country is labor to develop our resources.

Where Farms are Advertised.—G. Oher. Farms for sale are frequently put into the hands of real estate agents in the neighboring cities, who advertise in the daily or weekly papers. A visit to a reading room in the city, where all the papers are kept, would give you the desired information. The cheapest farms will generally be advertised in the local papers in regions where there is the least enterprise.

Boston Marrow Squash for Milch Cows in Winter.—At the annual meeting of the N. Y. State Agricultural Society, Judge Osborn, of Albany, made interesting statements in regard to his mode of cultivating, preserving, and feeding this important crop. He thought it very valuable as a part of the winter feed of milch cows. After the fall feed was over, he fed with cabbage until about the 1st of January, and then with squashes for two months, and followed with mangels and then with carrots. He thought one pound of the squash equal in nutriment value to five pounds of pumpkin. The cows were very fond of them, and they imparted no disagreeable flavor to the butter. He sometimes fed fifty pounds of squash to a cow in a day.

He cultivated the Marrow among his corn, reserving every fourth row for this purpose, running clear across the field. The rows were four feet apart. The squashes thus had a fourth part of the land, and as much sunshine and manure as the corn had. He did not approve of the too common method of stealing a crop by planting pumpkins in the same hill with the corn or potatoes. He had two methods of guarding the vines against destruction by bugs. As soon as the vines began to run vigorously, he covered all about the roots with fine manure to induce the formation of new rootlets near the surface. This hastened the growth, disturbed the bugs, and helped the starting of new roots. A little later in the season he covered the vines at the joints, so as to make them strike roots there. If they lost their first roots by the bugs, as they sometimes did, they would be nourished by the joint roots and perfect their fruit. Plaster was used to prevent injury by the striped bugs in the early stages of the growth of the vines. It required considerable labor to guard the squashes against freezing after they were gathered in the fall. His rule was to keep just ahead of the frost in protecting them. They were gathered into heaps in the field and covered when frost threatened. As the cold increased, they were carried to the cellar and laid upon shelves where they could be easily examined. The defective ones were removed as fast as decay made its appearance. He thought this squash was not in perfect condition for eating until the 1st of January.

National Trial of Plows, Harrows and Cultivators.—There will be a great trial of these implements held under the auspices of the New York State Agricultural Society near Utica, N. Y., on the 7th of May and days following, by a committee consisting of nearly the same gentlemen who officiated as Judges at the trial of Mowers, Reapers and other hay and grain harvesting implements, at Auburn last year. The programme was not received until after the April number of the *Agriculturist* was in the hands of our subscribers. According to the terms it announces, entries must be made two weeks before the trial, and \$20 entrance fee paid for plows, (\$5 if for exhibition only). The plows must be exactly as they are sold to farmers, and they are arranged under ten gold medal classes, as follows: I. Stiff-soil sod-plow; II. Stiff-soil stubble-plow; III. Light-soil sod-plows; IV. A plow which will plow 12 inches deep in stubble land, inverting the soil—"raise the lowest soil to surface of the furrow"—Programme; that is, probably, "raise the lowest soil to the surface of the furrow slice." For a plow which will turn a furrow of this kind, not less than five inches wide—the large gold medal. V. Michigan (sod and trench) plow; VI. Sub-soil plow in connection

with an ordinary (?) plow; VII. Ditching plow for opening drains; VIII. Machine for excavating ditches; IX. Steel plow for soils that will not scour; X. Swing or side-hill plow. A medal is offered for the best Harrow, and "Cultivators" are divided into two classes in each of which two gold medals are offered. The New York State Society by this action will place the public under renewed obligations to it and its public spirited officers. The trial will, we doubt not, result in great good.

The New Registered Letter System, which is to be a very great improvement in the matter of security, goes into operation June 1st, as we learn from official sources. We state by request, that some Post-masters are erroneously attempting to carry it out now; they should wait for the new "Register Packages Envelopes," the chief feature of the new system.

Unanswered Letters, Special Note.

In addition to the usual business and editorial letters, referred to Mr. Judd for advice and direction, he is in the constant receipt of many letters marked "Personal," on various topics, including friendly epistles he would like to answer, personal inquiries, offers of implements, etc. He has kept these along, responding as fast as possible—to the most important first—but they have accumulated beyond his hope of getting to the bottom of the drawer. He must soon have more time for rest, or cease to write at all. Will his correspondents please kindly excuse this seeming, but by no means designed or desired, lack of courtesy or attention to their favors and requests.

The Small Fruit Culturist.—By A. S. Fuller. The only work devoted to small fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail than in a work embracing both large and small fruits. Mr. F. has been so long identified with the culture of small fruits, that it is unnecessary to speak of his qualifications as a teacher. The work covers the whole ground of propagation, culture, varieties, packing for market, etc. While many will differ with the author in his estimation of the value of some varieties, all will agree as to the thoroughness, and clearness, of the practical part of the work—except perhaps those few growers, who wish to keep the secrets of the trade to themselves, these should recollect that the work was written for the people. The work is most abundantly illustrated. About 300 pages, \$1.50 by mail.

Medicines to Try.—We ask those who send us specimens of this kind to excuse us. We have no desire to compete with the Farmers' Club.

A Card.

BAROMETER CHALLENGE TO SOLON ROBINSON OF THE TRIBUNE.

Sir:—In your "reports" of the New York Farmers' Club you have more than once spoken of the Barometer in a manner to convey the impression that it is worthless to farmers, and its sale to them a humbug and swindle. You have said that "in your opinion it is utterly worthless to farmers; that it does not predict rain at all; that the rules laid down in scientific works for the observation of the Barometer are utterly fallacious, and that persons who depend upon the Barometer will fail fifty-nine times out of sixty in their weather predictions." Now, you have told me, in presence of witnesses, in effect, that "you knew nothing at all about mercurial Barometers, or their operation, that all the chance you ever had to observe the movements of a Barometer, was from a few weeks' use of an imperfect Aneroid, and that you did not feel competent to decide upon their merits." Knowing your reputation as a writer of fiction, (Mc-won-i-toc, &c.) I, of course, know how to appreciate the first of the above statements, but appearing, as it did, in a widely circulated journal, the public is liable to be led into hurtful error, from the great difficulty in discriminating facts from fiction in your "reports." To get at the truth of the matter, I make you these propositions:

1st. There are many thousands of Woodruff's Barometers in the hands of practical farmers in this country. You may procure as many certificates as you can from persons using my Barometers to prove your point, and if I do not show forty certificates from farmers of its value and practical utility for every one you can produce to the contrary, then I will yield the point.

2d. I will place one of my Barometers in the hands of a practical, disinterested man, who shall keep a record of its movements three times a day for three months, and from its movements alone, daily predict the coming weather, in strict accordance with a printed "card of directions," which I will furnish, and for every time he fails to predict correctly the coming weather, I will for-

feit the sum of *five dollars*, while for every time he proceeds correctly, you shall forfeit the sum of *one dollar*. If at the end of three months the balance of forfeitures is against me, you shall pocket it. If the balance of forfeits is in my favor, it shall be used to advertise the result in the *American Agriculturist*. In both cases, and whatever the result, you are to publish this challenge, and the results arrived at, in the *Tribune*. You cannot object to the fairness of this proposition, for, as you publicly state that the Barometer falls fifty-nine times out of sixty, and you gain five dollars for each failure, and I but one dollar for each success, if your statement is true, you will get \$295 for every time I get \$1. I make this offer in good faith, and will act up to it, and, if you require it, will deposit \$500 in advance as security. I do not make the proposition as a betting or gambling scheme at all, but to call out evidence and thorough investigation, that we may have more tangible and certain proof than random individual statements, if the facts are as you have stated. Your connection with the *Tribune* gives wide circulation to your statements, and it is important to the public that they do not lead to error.

Yours, very truly,

CHARLES WILDER.

Peterboro', N. H., April 2d, 1867.

Walks and Talks on the Farm—No. 41.

A few days ago I got a letter from John Johnston. After he had sealed the envelope, he wrote on the outside: "Write the name of your farm plain; I cannot make it out."

I call it "Moreton Farm." One has to have a name of some kind, you know. Rose Hill, Sunnyside, and similar names would be too sentimental. "Edgewood" I like, but Ike Marvel has appropriated that. Henry Ward Beecher's Farm in Lennox, before he bought it, was called "Mount Desolation." But when I saw it, a dozen years ago, it was a lovely spot. If I could have got those glorious old elms by adopting the name, I would have done so. But there was no hope of that, and so I finally adopted a name which has no meaning in itself, but which, to me, revives the pleasantest recollections of my early days. Moreton was the place where my forefathers lived and died. The old thatched home is still there, but the family is gone. Not one remains, and the farm is in other hands. My uncle John, the last occupier, was a good specimen of an English farmer. His father died when he was sixteen years old, and he and my father carried on the farm jointly for a dozen years or so. The farm contained 260 acres, half of it high rolling land, and the other half low and wet. The latter produced little but rushes and coarse grass. My uncle cut a deep ditch through this land, and underdrained into it. The effect was magical. It produced enormous crops, and for eight or ten years previous to the close of the war in 1815, the price of farm produce ruled fearfully high. He has sold wheat at \$5 a bushel. Of course he made money. But I have heard him say that he did even better later in life, although prices were much lower. This was because his land became richer and richer, and he grew heavier crops. I hope such will be the case in this country.

On this two hundred and sixty-eight-acre farm he raised 40 acres of wheat, 40 acres of barley, 40 acres of turnips, 5 acres of vetches, and sometimes more, cut green for the horses in summer, and six or eight acres of potatoes for fattening pigs. I think his wheat in later years would average, one year with another, 30 bushels per acre, and the barley 40 bushels. In addition to this he kept, on an average, 44 milch cows. He raised a dozen of his best calves every year; had a dozen two year olds, and fattened for the butcher every winter a dozen cows;—their place in the dairy being supplied by the dozen three year old heifers he had raised. He made cheese, and it was of excellent quality, although the night's milk was skimmed in the

morning before it was put into the vat with the new morning's milk. And in this way he got about 100 lbs. of butter a week, in addition to the cheese. He kept nine horses, 150 large Southdown and Leicester sheep, and many pigs.

My land is naturally richer than the old Farm. Why cannot I make it equally productive?

In the dairy districts of this State, the farms are kept too exclusively to grass; and in the wheat region, too exclusively to grain. If we could combine the two should we not obtain better results? My uncle was a wheat grower, and his wife a Cheshire dairyman's daughter. In Cheshire the land is devoted pretty exclusively to the dairy. But at Moreton they combined the two systems, and I believe they made nearly as much cheese, butter, mutton, wool, and pork, as if the whole farm had been devoted solely to these; and on the other hand they obtained as much wheat and barley as if the farm had been devoted exclusively to grain.

Now I do not see why my farm, and much of the land in Western New York, will not produce as good cheese as the land at Moreton, and certainly as good meat. I asked Mr. Willard to visit Moreton and examine the matter. I do not know whether he did so or not. Sanford Howard did so, and I wish he would give his views on this subject. At Ingersoll, C. W., there is a large and flourishing cheese factory, and if I mistake not, it is as much a wheat growing section as Western New York. We want manure on our wheat farms, and wool growing is not very profitable, and cattle can be fattened cheaper at the west than here, and so with pork. But if we could make cheese, the problem would be solved. We could feed high, make rich manure, and raise good wheat.

Donald G. Mitchel, in his *Wet Days at Edgewood*, a book I am never weary of reading, quotes a maxim from Columella, which he says is broad enough to cover all possible conditions: "Whoever would devote himself to the pursuit of agriculture, should understand that he must summon to his aid—prudence in business, a faculty of spending, and a determination to work."

My uncle had all these. He had prudence, but it did not degenerate into parsimony. He fed his land and his stock with a liberal hand. He was not afraid to lay out money in improvements. He could look ahead and was willing to wait. He had confidence in good farming.

As an instance of his "faculty of spending." When guano was first introduced, he heard on good authority of its astonishing effect, and ordered five tons to give it a trial. It proved to be all that could be desired and the next year he ordered ten tons.

I once tried to persuade one of our Monroe County potato growers to use guano, and finally succeeded. "When you send for yours, you may order *fifty pounds* for me. I have not as much faith in these things as you have, but am willing to try it."

I want to raise a good crop of corn this year. The field has been in grass for some years. I am plowing under some 25 loads of manure per acre, and have a heap of last year's manure in the field, thoroughly rotted, that I intended to spread on the surface after plowing and harrow it in thoroughly before planting. "Would it not be better to put it in the hill?" Possibly it might, but the roots extend farther than we imagine, and will find it. Besides, I do not plant in hills. I shall drill in the corn. The Deacon does not believe in drilling. He thinks corn

does far better in hills.* But John Johnston writes me that he has drilled in all his corn since 1846, and few men have better crops.

I wrote Mr. Johnston that my underdrains were running freely, while the surface was frozen as solid as a rock, and asked him how the water got into the drains. He replies: "Don't you know that when we have much snow it draws the frost out of the ground, and the tile drains discharge all the water there is in the land? Some of mine have discharged water all winter. Where the snow blows off, they don't. You will learn much if you keep farming and draining! Some of my wheat made a good growth under the snow this winter. I suppose thousands of farmers never notice this fact." The above appears to be a partial explanation, but does not, it seems to me, cover all the facts.

I have just received the April *Agriculturist*. As Mr. Johnston says, I do not write very "plain" and the printers doubtless are often troubled to make out my meaning. They sometimes guess at it, and do not always hit it. Speaking of underdrains filling up with sediment, they make me say: "The chief danger is from the surface water washing away the soil, more or less, and running in large quantities into the drain." What I intended to say was, that where the drains run through the valleys of rolling land, the water in the spring runs along the surface of the frozen land and accumulates in the valleys over the drains. The soil over the drain is not frozen as hard as the rest of the land, and in several instances on my farm, the water soaks through this soft soil and makes a hole down to the drain, small, probably, at first, but soon wearing larger. These holes are usually about the size of a rat-hole, running perpendicularly down to the tiles. But where there are larger tiles the holes are sometimes larger. What I was afraid of was that this water, being more or less muddy, might, in a drain that has little fall, deposit silt, and choke it up. But I have recently been examining the matter, and find there is less danger from this source than I expected. The water being two or three feet above the drain, must be forced through the tiles with considerable rapidity, and carry the sediment with it.

While my hand is in, I may say that the argument in favor of feeding clover hay and oilcake in the March No. is rendered obscure by the omission of a line. It should have been stated that "the manure from a ton of oilcake is worth \$19.72." Several gentlemen have written me about my remarks on this subject. If they will supply this line, and take a pencil and go over the calculation, they will come to the same conclusion that I did—namely, that, after deducting the expense of carting and spreading the manure, the net value of a load of clover hay and oilcake dung, with part straw for litter, is *seven times* as great as the manure obtained from feeding straw alone. And if this is true, are we not making a mistake in allowing American oilcake to be shipped to England?

Cotton-seed cake, which I understand is being made extensively, is more valuable for manure even than Linseed oilcake. It contains 6½ per cent. of nitrogen, 7 per cent. of phosphate of lime, and over 3 per cent. of potash, and these figures show that the manure obtained for a ton of it is worth \$27.86. This is on the supposition that the husks are removed from the cotton before the oil is expressed. If this is not the case, the cake will be of far less value for manure, and

of no value at all for feed. It is the "decorticated cotton-seed cake" that we need. It is valuable feed, and affords the richest manure, of any known vegetable food that has been investigated.

A correspondent asks me how I plant and cultivate beans. Last year I turned over an old sod, harrowed it thoroughly, marked it out in rows 2 feet 5 inches apart, with a common wooden marker, then drilled in the beans with the "Corn and Bean Planter." We finished the whole field of twelve acres in a day and a half. Of course it is not necessary to mark out the land before planting. The drill will do its own marking, but I find it better to mark the land first, as the drill can be guided so much straighter. The drill sows two rows at a time, and when the land is marked in advance, the tubes, or "hoes," run in the marks, and you can see the least deviation. I set two men at it, one to drive the horse and the other to guide the drill. Too much pains cannot be taken to plant straight. A little extra labor in doing this will be saved five times over in the after culture. Of course this is equally true of corn, potatoes, and all other hoed crops. The drill drops five or six beans in a hill, about 14 inches apart. I have no doubt the beans would do just as well, and perhaps better, if dropped a single bean at a time, two inches or so apart. They do very well planted so in the garden, but having them in hills is more convenient in hoeing. I hoed mine only once last year, but kept the cultivator running frequently between the rows. This is the great point, and it is here where so many fail. It is said to rust the leaves if cultivated when the dew is on. This may or may not be so. I do not know. But I do know that frequent cultivation will make all the difference between a good crop and a poor one. One of my neighbors told a friend that "there was the grandest field of beans he ever saw in his life on the north road." "They are Mr. Harris'." "Not they, he hasn't got a field on his farm that will produce such a crop as that." But they *were* my beans, and what is more, they were planted on the roughest and most neglected field on the farm—a field that had not been plowed for fifteen years, and produced little else than thistles and teasels. There was a great growth of beans, and it was caused by nothing but *frequent cultivation*. I do not know how often they were cultivated, but I think eight or nine times. At all events, not a weed was suffered to show its head between the rows.

"What is the best variety?" I have not had experience enough to tell. Hayward thinks the Marrow is the most profitable. It yields nearly or quite as well as the medium, and brings a higher price. The only objection to it is that the beans are apt to split open.

I question whether there is anything gained by scalding seed-peas to kill the pea-bug. Of course it will kill the bugs, but whether the next crop will be any more likely to escape, is somewhat doubtful. Two years ago I got my seed-peas from Canada. A finer sample could not be desired, and there was not, apparently, a bug in the whole fifty bushels. I sowed them on twelve acres and had a splendid crop. But a more buggy lot of peas I never saw. We thrashed them rather late in the fall, but on a warm, sunny day, and the bugs, or more correctly weevils, flew above the stock and round the heads of the men by thousands. The partly dormant bugs might have been gathered from under the fanning mill by the bushel.

This crop, as I have said, was grown from

seed free from bugs. And it seems to me clear that simply destroying all the bugs there may be in the seed, will not insure a crop from their depredations as a consequence.

I may mention that the next year I sowed these buggy peas, and they grew apparently as well as sound ones. I presume they were as buggy as the previous crop, but I fed the peas to the pigs early in the fall, before the bugs were fully developed. This is really the only plan we can adopt, with safety, in this section. It is no use trying to raise peas for market, although I did sell a load or two to the *coffee* manufacturers in the city. They prefer, however, to get sound peas from Canada, though for my own part, I think a certain proportion of bugs in the peas, after they were roasted and ground, would make about as good coffee as the sound peas. But then, you know, people have their prejudices, and it is well to humor them.

One of my neighbors last year sowed his peas in June. They escaped the bug. But the crop was hardly worth harvesting. Better sow early, on rich land, raise a heavy crop, and feed them out very early in the fall, to the pigs. The crop will pay very well for this purpose, and a good smothering crop of peas leaves the land in good condition for wheat. And no crop that we raise makes richer manure than peas.

Origin of Forced Drones.

BY BIDWELL BROS., ST. PAUL, MINN.

[By Forced Drones, those are meant, which, being reared in worker cells, are of small size and lower vitality than those raised in drone cells. Worker bees are imperfectly developed females, and Fertile Workers are those which are sometimes found laying eggs. These eggs not having any impregnation, if they hatch, all produce drones. Forced queens are those reared in case of the loss of a queen from eggs or larvae which would have become worker bees, if hatched and fed in the usual way.—Ed.]

We found the origin of, and gained ability to recognize fertile workers, in trying to answer a question often put to us, much in this way: "Why do my bees, having reared forced queens, which were all removed before they commenced to lay, or lost in their flight to meet the drones, refuse again to rear queens, though worker eggs and larvae be repeatedly given them, and destroy queen cells or kill queens, but persist in rearing drones in worker and drone cells?"

On removing a queen from a hive to induce the bees to replace the queen by rearing others from worker eggs or larvae—as they will, several, —sometimes many common worker bees commence to consume large quantities of honey and pollen for the purpose of secreting jelly, to feed the selected worker larvae to convert them into queens. This food, we suppose, develops their dormant ovaries, so that they may thereafter lay eggs. At first they are noticeable from their singular and uneasy motions, and are continually eating. We have often, in cool weather, separated the honey and pollen from these bees, by intervening empty combs, and always found these particular bees first at the stores. After several days, they have the appearance of robber bees—a black color, which in time has an oily look. We once tried to see if a high temperature gave robber bees their dark, greasy appearance, and allowed a stock of bees to steal or rob a pail of honey, first placing a thermometer in their hive; in 20 minutes the temperature arose from 64° to 108°. We had often observed the bees to take on that color, in hot,

close weather, and confined a swarm on a hot noon-day, and the temperature arose to 131°, melting the combs with the great heat, the bees all becoming of this dark color and greasy lustre. One of our hottest days last summer indicated a temperature of 128° in the sun, and the brown of nearly all bees in close locations turned black.

When bees lose their young queens, they feed and caress the bees above described, and they, after some days, commence to lay eggs in worker, drone, and queen cells, often 10 to 15 eggs in a cell, laying more when the weather is cool than when it is hot. When one egg in a cell hatches, the remainder are consumed by the nursing bees. As drone larvae are fed similar food to that fed to workers, drones mature in worker cells; yet these do not attain more than two-thirds the size of natural drones; while the larvae from eggs laid in queen cells, doubtless from a difference in food, die before maturity. Unfecundated queens—those forced queens reared early or late in the season, and not meeting the drones or having met this kind of small drones, and the seed becoming exhausted, are worse than fertile workers, as they are more prolific, and more frequently lay in worker cells.

Although forced drones are apparently able to fulfill the office of male bees as well as forced queens that of a queen, they ought equally to be avoided as causing the degeneration of the stock.

[The Messrs. Bidwell answer the question proposed in their first paragraph, but do not tell what to do in such a case. We suppose the cure is simply to introduce an impregnated queen, kill the fertile workers, or break up the colony.]

Culture of the Castor Oil Bean.

BY S. B. STEWART, CLEAR CREEK LANDING, ILL.

[Although we are not familiar with the culture of the castor oil bean, except as an ornamental plant, we have no doubt it might be profitably cultivated in parts of the Union where now it is unknown. The geographical limits of its profitable employment as a farm crop, are, we should judge, nearly coincident with those of the Sweet potato, or the larger varieties of Dent corn. The following communication to the *Agriculturist* will be read with interest, and, though so late in the season, may form the basis of experiments, with a view to planting more largely another year.—Ed.]

"I plant what we call the Florida Beans; they are smaller than the Spanish Beans, and do better in this latitude; then, there is more oil to the bushel, (so say the oil factory men). They can be raised about 100 miles north of us, with success. A fair crop here is from 16 to 20 bushels per acre; 100 miles north, 10 to 12 bushels per acre. The soil is prepared first, the same as for corn, then lay your ground off both ways, seven feet apart each way, plant as soon as the frost is out of the ground and it will do to plow. Before planting, soak the beans say from 12 to 20 hours in warm water—about as warm as the hand will bear when beans are first put in—plant and cover same as corn, dropping two beans in each hill. They require about a week longer to come up than corn, and when the plants first come out of the ground, they are red. Castor beans are usually planted here on our poorest soil; still, a much better yield can be had from rich land. Our object in planting on poor soil is, that a crop raised on a piece of land one year, is equal in its effects to a crop of clover plowed in towards enriching, or "bringing land to," as it is often termed. Plow or use a cultivator (*the latter is the best*), when the plants

stand about 3 or 4 inches high, going close to the plant, leaving the middle of the row until you have gone both ways of the rows, and the beans have fresh loose dirt about the hills; then go through and clean the middle with a cultivator or plow. When the stalk is 7 to 10 inches high, go through and thin out, leaving one stalk in a hill; then plow or cultivate as corn, only be careful not to plow after the stalk is so high that the whiffletrees will break the branches and thus injure the plant. In fact, when the plants average 12 to 18 inches high, they can take care of themselves if the weeds are kept from the middle, between the rows. No stock will eat them excepting young colts, and if the land is grassy it is often well to turn in sheep or hogs.

I planted last year on the 9th of May (rather late); and began to gather the 14th of August. One can easily tell by watching, when the spikes are ripe enough to cut, viz.: when the bottom pods begin to crack; then cut the spikes and draw to a dry house—drying yards are nuisances. St. Louis, New Orleans, or New York are good markets—either of the latter preferable.

[This plant is a native of tropical countries, and where no frost stops its growth, attains the size of a small tree. The leaves are very large, and the contrasts of color in the leaves, stems and leafstalks, make it quite ornamental. The fruit is borne on spikes growing in the axils of the leaves and branches, and the seeds are inclosed in burs somewhat like miniature horse-chestnut burs. These, when ripe and dry, explode or "pop," throwing the seeds to a distance

CASTOR BEAN DRYING HOUSE.

of 12 or 15 feet, sometimes. When the gathering takes place, the spikes are cut when brown, and the bottom pod begins to crack open, and are spread in the sun, when no kiln or drying house is at hand. The ground where they are dried is called a "yard," and is prepared by leveling and rolling hard a piece with a good southern exposure. The ground so prepared is fenced with boards, to prevent the loss of seeds, or it is made to extend 12 to 15 feet on every side wider than the space covered by the spikes

when spread out to dry. They are spread thin, and turned occasionally. In case of rain, the spikes are raked up and covered, and the beans are swept up. When all the pods have dried and shed their seeds, they are raked off, the beans winnowed, put in sacks and kept in a dry place. Ten acres of castor beans will justify the build-

GROUP OF IMPORTED CREVECOEUR FOWLS.—Drawn from Life for the American Agriculturist.

ing of a drying house of 12×20 feet.—[Ed.]

DRYING HOUSE OR KILN.—The kiln or drying house is usually a frame or log building, but the material is unimportant. The one figured is about 20 feet long by 12 wide. The drying floor is 6 feet in the clear above the ground floor, and is made of slats a quarter of an inch apart. The floor above the stove is tight. The stove is set near the door and a 6×6 foot space is left around it. A pipe passes under the floor to the rear, where it passes through the floor, and returns above the spikes, and both the space around the stove and that through which the pipe passes, are surrounded by a boxing. The spikes being frequently stirred, the beans drop through the floor and accumulate below. There is a window above the drying floor for taking in the green spikes and removing the dry ones, which are used as fuel; and there is for convenience a window also, below the floor.

The Crevecoeur Fowl.

This breed derives its name from Crevecoeur, a town of Normandy, France, where for several years past, they have been extensively raised for the Paris markets, being highly valued both for weight and delicacy of flesh. The hens are low on the legs, with large fleshy thighs, the wings large, and the body square; the abdomen is voluminous and pendant, especially in those which are more than a year old; they walk slowly, scratch but little, and rarely fly. Their plumage is black, except white feathers may appear in the tuft on the head; the tuft is large, and the comb small, upright, two-horned; while a large cravat of feathers under the neck gives to them a matronly air, the tuft and singularly shaped comb present a grotesque but not unpleasant appearance. They are very tame, ramble little; in this resembling the Brahmas.

The cocks, which are similar in form to the hens, have a brilliant black plumage; their

heads are handsomely surmounted with beautiful tufts, and large toothed, two-horned combs, which together form a kind of crown; they have also dense cravats of feathers, and are adorned with pendant wattles of large size.

The chickens are of great precocity, being frequently put up to fatten at the early age

of three months. The hen produces large eggs, and is an excellent layer, but scarcely ever sits. Such is the description given in French works on fowls. So far as the appearance is concerned it is correct, as seen in recent importations. The accompanying illustration was made from pure bred birds, imported from the Jardin d'Acclimatation, Paris, and owned by A. M. Halsted. Mr. Jas. E. Mallory of Tarrytown, N. Y., who has some of the same stock, regards the likeness

as quite faithful. If the breed proves to be as hardy and valuable here as it has in France, it will be an excellent addition to our present stock.

Baskets for Sitting Hens' Nests.

The use of baskets for hens' nests is mentioned by some of the very earliest writers upon agriculture in our language, and in some respects they are peculiarly advantageous. Boxes are very apt to get musty and damp; baskets on the contrary, give free ventilation to the nest and its contents. They afford no safer lodging places for vermin than boxes, and may very easily be

moved, cleaned and washed. The one which we figure is in the style of those in common use in France, where poultry are reared so much more systematically than in this country. It represents a home-made willow or wicker affair with a cover to shut the hen in, she being taken off or allowed to go off once a day to feed, and a label is attached for any memoranda which may be desirable—at least, for a record of the kind of eggs and the date of setting the hen.

The American Black Bear. (*Ursus Americanus*.)

Bears are not very uncommon over a considerable portion of the Northern United States, and the one we represent is the only species ever seen wild in America south of the Arctic regions, and east of the Great Plains. The Yellow bear and the Cinnamon bear being regarded as varieties of this species. The American Black Bear is seldom more than 6 feet in length, and 3 feet in height at the shoulders, and is characterized by its long, straight, shining black coat, high, oval, rounded ears, short tail, short feet, and short blunt claws, covered by the hair. Its color is dark brown to nearly or quite black, with a yellowish, dusky brown patch on each side of the muzzle. The food of this bear is almost exclusively of a vegetable nature, namely: wild cherries, berries, grapes, nuts, acorns, honey, sundry roots, and such things. It eats eggs also, and some insects, and when very hungry, small quadrupeds and birds—though it seldom takes animal food from choice. When sore pressed, bears sometimes enter farm-yards and do considerable damage, being partial to pigs and poultry—taking also it is said, sometimes a sheep or a calf. The chief damage they do to the farmer is, however, in his potato fields, corn fields, and orchards—preferring the corn in its green state, when fit for boiling, and eating large quantities of sweet apples, peaches or other fruit. The bear is timid and will seldom attack a man, never, unless provoked or in defence of its young. The female has two young at a time, bringing them forth very early in the spring. Continued severe weather not unfrequently forces them out from their retirement soon after this, in search of food, and at such times they are often captured, the old one submitting, at least at first, with a poor grace to restraint or confinement, but the young ones becoming and remaining as tame as puppies. Bears are naturally docile and imitative; they climb trees with ease, are very quick in many of their motions. They are protected by a thick hide, a very thick

coat of furry hair, and almost as thick a coating of fat as a well fed porker, and thus possess a triple defence against blows and against cold, as well as against the attacks of dogs or other animals. The flesh is delicate and savory, the steaks having much the flavor of pork. During the winter the meat is still common in the mar-

net characteristics of this bear are large size, and great length of body, (which varies considerably, occasionally reaching a length of nine feet with a height of four feet, and weight of 1,500 pounds), the neck is also proportionally long; a small head; very small ears; soles of the feet very large; the liuc of the forehead

and nose remarkably straight, and the coat of fine long fur of a nearly white color. These bears range and rule within the North Polar Circle, upon the ice-bound coasts and floating ice. They do not live long in menageries or zoological collections on account of their suffering from the heat, but they always form a very attractive feature in these exhibitions. The flesh is not savory. The habits of the Polar Bear are little understood. Whether they hibernate, or not, is not settled. It would seem prob-

able that when the long arctic winter night shuts down, the well fed and fat ones retire into winter quarters, but those not in so good condition, wander as prompted by hunger in search of food. It is an interesting fact that the shape and character of the teeth of this purely carnivorous bear vary scarcely at all from those of the almost purely vegetable eaters of the same genus. These animals are hunted by the inhabitants of those

regions where they abound, for the flesh which doubtless compares favorably with that of the seals, walruses and oily fish, and for the skins which form an article of commerce, making very fine sleigh robes, etc.

THE "TEXAS MURRAIN."—This disease, also called "Spanish Fever," which had entirely disappeared during the war, has, this year, done in some sections terrible injury. It is known only in the track of Texas cattle, or those with which they have come in

contact, its period of incubation is very short usually, but with the Texas stock very long, so that apparently healthy cattle communicate the disease, and cattle die after taking it, while the original animals are still well, to all appearance. The fatal symptom is extreme thirst; death follows soon after drinking. A severe frost is said to put an end to the disease.

THE AMERICAN BLACK BEAR.—(*Ursus Americanus*.)

kets, even of our eastern cities; the grease is in considerable request for hair oil, and brings a good price, and the skins are valuable and salable according to size and the quality of the fur.

The Polar Bear (*Ursus maritimus*.)

The White or Polar Bear is regarded as the largest, most powerful, and, with the exception

THE POLAR BEAR.—(*Ursus maritimus*.)

of the Grizzly Bear of the Rocky Mountains, as the fiercest of the bears. They are courageous in defence of their mates, and of their young, for which they manifest the most touching affection; savage when attacked, and very tenacious of life. The food of Polar Bears is wholly animal, they live chiefly upon fish, and are altogether maritime in their habits. The promi-

Large Root Crops.

We notice in the Report of the Massachusetts Horticultural Society, that the farm connected with the Deer Island House of Industry raised extraordinary root crops. An acre in mangolds produced 73 tons of roots, carefully weighed, and 5 tons in tops, by estimate. This acre was planted with potatoes in 1863, carrots in 1864, onions in 1865, and with mangolds in 1866. The manure, each previous year, had been 20 cords of compost of sea kelp and stable manure. In the fall of 1865 it was heavily coated with sea-weed (*Laminaria*), and the weed plowed in and re-plowed in the spring of 1866. The seed was sown in drills 30 inches apart. Mr. Payson, the manager of the farm, estimates the value of mangolds as equal to sugar beets, and the yield as one-third greater. The rotation and the adaptation of marine manures to mangolds, are noticeable points in this statement. On the same farm and with similar treatment, 29 tons of carrots were grown to the acre. Our shore farmers who neglect sea-weed and root crops are not living up to their privileges.

Tim Bunker on Jim Crow.

MR. EDITOR:—It may seem an ungracious task to say a word agin this gentleman, when everybody is writing up people of color in general. Folks who, a year ago, could not express their disgust of the negro, in language strong enough, are now bawling for universal suffrage. Such sudden conversions I never saw in camp meeting. But I have been in favor of their voting this twenty years; so I've no prejudice agin color to influence my opinion on the crow question. You said you wanted all the Hookertown news, especially if it had any bearing on farming. Now you see, we have had a big ferment in the Farmer's Club up here on this question, which is certainly as old as I am, and I guess as old as the country. I thought it had been settled several times, but it is one of them questions that don't stay settled. I expect it is because we haven't got upon the right foundation yet. I have always noticed that any unsound opinion kept working in the public mind like bad food in the stomach. It won't stay down. Hookertown has spoke and I rather think Jim Crow is settled forever.

You see, these creatures had been uncommon plenty last season, and we had all suffered more or less from their depredations in planting time, and this had been put down as one of the things that was to be discussed and settled in the Club this winter. "Jim Crow, shall he jump or no?" In old times in Connecticut they said no, and offered a premium on crows, and the boys used to hunt them, and bring the young ones by the basketfull to get their pocket money. Then the men, who were science on birds, thought the crows killed a good many grubs, and paid their way and said we must not kill them.

Deacon Smith was chairman for the evening and stated the question. He said "it was admitted that the crow did some good and a great deal of mischief. The point was to find out whether he did more good or hurt."

Jotham Sparrowgrass said "he did not think there was any question at all about it. He knew what he was about when he went to the Legislature in Hartford, well nigh fifty years ago, and got the law passed to give a bounty on foxes and crows. He said both of 'em were the farmer's enemies, and he didn't know which was the worst. He said our fathers understood their

cases, and killed them off as fast as they could lay hands on them. Talk about crows destroying bugs! He has shot 'em many a time, and he always found more corn and carrion in their crops than anything else."

Cicero Smith said "he was astonished to hear such sentiments from his venerable friend. He thought the crow had not been made in vain. If it had not been for some good end he would never have been brought into existence, and been made so hardy and so prolific. He was a very long-lived and very shy bird, so that with all the warfare which men had made upon them they were as numerous as ever. They were the farmers' friends, picking up a multitude of grubs and worms that preyed upon his crops, and acting the part of a scavenger in removing dead animals, that would otherwise pollute the atmosphere; they pulled up some corn, to be sure, but every laborer was worthy of his hire."

Mr. Spooner, our minister, said "he found some difficulty with Mr. Smith's argument. A good many creatures had been made for a different state of the world than existed at present, and if we admitted that they were originally useful, it would not follow that they could not very well be spared now. He said they had found over in Shadtown, and in many other places, the remains of extinct birds, beasts and fishes. These fossils had had their day, and died out, or been killed off, because they had become nuisances. He was inclined to think that it was about time for man, who was lord of nature, to dispense with the services of the crow; he could join the great company of fossils without disturbing the balance of nature. He admitted he had been useful in the earlier ages, when animal life was more abundant, and the air was likely to be tainted with the effluvia of dead animals. But the farmer did not need such a scavenger now. Dead animals were exceedingly valuable for the compost heap, and he must be a very foolish cultivator who would allow them to waste unburied. Wolves and bears, and other wild animals had disappeared from the State, without any suspicion that the Almighty had made a mistake in their creation. He thought that the crows could all be killed off without interfering with the divine purposes, according to which man has the responsibility of subduing nature, and ruling over it."

Jake Frink said "he was agin crows, and had been from the start. He never had been on more than one side of this question. They pulled up his corn whether it was tar'd or not, and strings and scare crows had n't any more influence on 'em than on the wind. He had seen 'em light right on a stuffed man. He never'd found but one thing to fix 'em, and that was corn soaked in New England rum. That made the critters so drunk you could knock 'em over as easy as lame geese."

Seth Twiggs thought "that was the best use neighbor Frink could put his rum to. If he kept it, he was mighty afraid that somebody besides the crows would become extinct. His opinion was that 'carrion crow' expressed the character of the bird as well as his habits. He not only pulled up his corn, and bothered him to death with planting over, but he destroyed the eggs and young birds in his orchard. He was a thievish, blood thirsty fellow, ready to kill any thing, that has not strength enough to defend itself against his attacks. He knew a good many of the small birds lived mostly on insects, for he had watched them when feeding their young. He thought the crow destroyed the grub killers, instead of the grubs, and he

was glad to see folks getting waked up to his true character. He should go strong for smoking him out."

You see which way the current is setting up here. Every crow thinks his own young the whitest, they say; and I am perhaps a little prejudiced in favor of Hookertown, but it strikes me that there is about as much good common sense in our Club as there is in any scientific society. I have to admit that I have been on both sides of this question, but have found hard bottom at last. Our fathers were right in killing crows. The birds belong to the fossil age. There is no music in his caw. He prefers a dead carcass to a living one, and will devour a half pound of putrid flesh a day. We can make a better use of the flesh than to bestow it on this sneaking thief. He destroys our song birds and worm eaters in the nest. He is the pest of our corn fields and the scourge of our orchards, where the farmer's true friends build their nests. A strong petition is going up to the Legislature from Hookertown this spring for a big bounty on crows.

Hookertown, Conn., } Yours to command,
March 1st. } TIMOTHY BUNKER, Esq.

The Pennsylvania Agricultural College.

[We have of late refrained from any allusion to the Agricultural College of Pennsylvania, for the reason that reports came to us, from various sources, of its utter inefficiency and demoralization. The trustees have made a new start, and their appointments, as far as we are informed, are highly commendable. The following account of its condition and prospects is by a scientific friend, who is in no way connected with the College, and we give it without adopting his views in some particulars.—Eds.]

Some time since accident led us into the neighborhood of the Agricultural College, and we availed ourselves of an opportunity offered for going through the building, and being made familiar with its workings.

We start out with the statement that it this session begins its course under new and more promising auspices. First in the list of reforms, we find the abolition of compulsory labor. In theory, I am aware, wiseacres will tell us the move was a bad one, and likely to frustrate entirely the original design. But we do not so see it. Boys are boys, (no doubt all will admit,) whether found in the streets of their native towns, or under the protecting ægis of a literary institution, and to convince a hundred or more of them that there existed a necessity of doing well the work assigned them, would, we imagine, be a task likely to baffle the most practical men. We contend that loose habits of working will be more likely engendered than correct ones. The best evidence of the truthfulness of this statement may be taken from the opinions of those in the vicinity of such institutions. While labor is no longer compulsory, the students may, on demand, have portions of ground assigned them, and, in the care of such, their agricultural propensities may be thoroughly ventilated. As a ready and accomplished guide over these operations, the Professor of Agriculture may exercise his authority. Here at once is instituted a generous rivalry, instead of the slipshod habits induced by making all men, men of all work, and then lumping the result. The time allotted for completing the course of study is too short to allow of from three to four hours outside labor per day.

A glance at the curriculum shows a new feature. While the literary course is quite equal

to that of our best colleges, and may be adopted by all so inclined, there exists also a course of study more polytechnic in its nature, and which is more advanced in its requirements than that of some older and more pretentious institutions I could name. Let us glance *en passant* at the course of study insisted on as the requisite for obtaining the scientific diploma of the College: Anatomy, Physiology, Botany, Entomology, Zoology, Shades and Shadows, and Perspective Drawing, Physics, Principles and Practice of Road Making, Chemistry (laboratory practice two years), Meteorology, Practical Astronomy, Physical Geography, Geology, Hygiene (lectures), Mineralogy. We have here selected from the list of studies *only such as are entirely omitted or passed over with the merest smattering in most colleges*. They are here brought out *practically* into a desired prominence. Correlated with these we find an item (not always noticed in college graduates), a decent acquaintance with our mother tongue imperatively demanded. Mathematics, Logic, Rhetoric, and the Constitution of the United States, come in to supply the polish. Ere long a competent Professor of Modern Language will take a place in the institution. A course of Agriculture adds to most of the above Horticultural and Agricultural practice, Lectures on Domestic Animals, their diseases and cures; Soils, Manures, Rotation of Crops, Drainage and Tillage, Grain, Grass, Root and other Crops, Agricultural Implements and Farm Buildings. Connected with the institute exercises proper, we have military exercises from the *School of the Soldier*, up to lectures on *Higher Tactics*, under supervision of acknowledged competency. These military exercises are obligatory. Cases of conscience alone are excepted.

One fact more is worthy of note—chairs are not filled by superannuated “good fellows,” who have no other visible means of support. The fitness of things seems to have been considered in making the recent appointments.

The State appropriation of the land scrip being now made to this College, it is placed on a secure footing, and may be expected to run an extensive career of public usefulness.

Such an institution has long been wanted to meet an existing necessity. Dead languages are placed in their proper position, and studies which really confer mental power in a *measure substituted*. For those who wish to take up Latin and Greek every facility is provided, but diplomas may now be merited without giving to them the major part of a four years' course.

Let us hope that ere long we may not the less “gaze at the stars,” but that we may fall less frequently into the mudholes of our own ignorance; that we shall have more men whose minds are rounded by proper educational courses, and fewer men made angular by contractions derived from some of the liberal studies.

Dog Statistics.

We have received several communications in reply to our correspondent's article on a dog law, signed “Connecticut,” in our March issue, some wise and some otherwise. It seems to us, that “I. H. P.” in his “word for dogs” admits all that “Connecticut” claims, and that they are substantially agreed. “It is really discreditable,” he says, “that almost the only dogs in the country which are treated with any care, are lap dogs, the most useless, and bull dogs, the least sagacious. The natural fruit of such neglect is a race of nondescripts of all kinds, deteriorated in body and brain.” It is because of this non-

descript character of our dog population that “Connecticut” and all friends of sheep want efficient dog laws in all our States. Ninety-nine out of every hundred of our dogs are worthless curs which need clearing out as much as the old Canaanites did to make way for something civilized, that can keep company with our domestic animals. The destruction occasioned among sheep by these animals is appalling, and only needs to be better known to secure the requisite legislation. The Department of Agriculture has made a beginning of gathering statistics upon this subject. In 373 counties reported, there was an estimated loss of 77,854 sheep killed, besides many others injured. Some counties suffered to the extent of 2000 or 3000, and the average number per county was 208.

From this, the number killed in the whole country is estimated at 500,000, worth at least \$2,000,000, while the injury to those not killed is another million, making a loss to the country of *three millions of dollars*, as the direct result of dogs killing sheep. But this is only a small part of the pecuniary damage inflicted upon us by these wretched curs. In many districts admirably adapted to sheep, farmers dare not embark in the business from fear of the dogs. In the counties where 3000 sheep are annually slain by the dogs, we think this kind of husbandry can not pay very well. The counties where few are slain, we apprehend, are the ones where the dogs have made sheep husbandry unprofitable. The pastures are desolate and growing up to brush for want of cropping. Millions of dollars are lost to the country every year from this cause, and we have, as a consequence, to pay dear for wool and mutton.

Then we have to add to this the enormous tax of supporting our dog population. We have no reliable statistics on this subject, but estimate one dog to a family, say seven millions in the whole country. Some families have none, but others have six, a dog to each child, and glory in them! The food that an average cur will devour would keep a pig, and is worth at least ten dollars a year. People who are paying 70 millions of dollars a year for the support of curs, to say nothing of damages, ought to make inquiries about dog laws.

Pleuro-Pneumonia or Lung Murrain.

The pleuro-pneumonia is one of the most fatal and distressing maladies which ever attack cattle. At all times liable to spread rapidly among animals coming near or in contact with those diseased, it frequently assumes the form of a contagious epidemic, being taken by almost every animal coming within striking distance. This was remarkably the case in Massachusetts a few years since, and the disease every now and then breaks out somewhere with alarming violence, but happily it appears to be more easily controlled here than in Europe, where the pole ax, or absolute isolation are the only approved ways of checking its ravages. This disease has been confounded with the Rinderpest or Steppe Murrain, which has lately wrought such distress in England, and has not yet stayed its march of destruction, but it has few or no symptoms in common with that, except contagiousness and fatality. The disease exists almost constantly among the swill-milk stables of New York and Brooklyn, and probably other cities, and certainly should come under the careful investigation of the Board of Health. The following description is furnished by Dr. Busted, of the N. Y. College of Veterinary Surgeons:

PLEURO-PNEUMONIA OF CATTLE.—A malignant form of inflammation of the lungs, of an eminently contagious character, peculiar to the ox-tribe, has existed within the memory of man in the mountain regions of Central Europe.

Symptoms.—From the time that an animal is exposed to the contagion to the first manifestation of symptoms, a certain period elapses; this is the period of incubation. It varies from a fortnight to forty days, or even two months. Some credit may be given to reports of even longer periods. During this period cows are found to thrive fast, and often to yield much milk. The first signs, proving that the animal has been seized, can scarcely be detected by any but a professional man; though, if a proprietor of cattle were extremely careful, and had painstaking individuals about his stock, he would invariably notice a slight shiver usher in the disorder, which for several days, even after the shivering fit, would limit itself to slight interference with breathing, detected readily on auscultation. Perhaps a cough might be noticed, and a diminution of the appetite and milk secretion. Though the amount of milk may not be much diminished at first, milk-maids sometimes say that a clever milker can tell when the cow is taken ill. The animal becomes costive, and the shivering fits recur. The cough becomes more constant and oppressive, the pulse full and frequent, usually numbering about 80 per minute at first, and rising to upwards of 100. The temperature of the body rises, and all the symptoms of acute fever set in. A moan or grunt, in the early part of the disease, indicates a dangerous attack, and the nostrils rise spasmodically at each inspiration; the air rushes through the inflamed windpipe and bronchial tubes, so as to produce a loud, coarse, respiratory murmur; and the spasmodic action of the abdominal muscles indicates the difficulty the animal experiences also in the act of expiration. Pressure over the spaces between the ribs and on the spine, induce the pain and shrinking characteristic of pleurisy, and a deep moan not unfrequently follows such an experiment. The eyes are bloodshot, mouth clammy, skin dry and tightly bound to the subcutaneous tissues, and the urine is scanty and high-colored.

On auscultation, the characteristic, dry, sonorous r  le of ordinary bronchitis may be detected along the windpipe and in the bronchial tubes. A loud sound of this description is not unfrequently detected at the interior part of either side of the chest, while the respiratory murmur is entirely lost posteriorly, from consolidation of the lung. A decided leathery friction sound is detected over a considerable portion of the thoracic surface. As the disease advances, and gangrene, with the production of cavities in the lungs, ensues, loud, cavernous r  les are heard, more or less circumscribed, occasionally attended by a decided metallic noise. When one lung alone is affected, the morbid sounds are confined to one side, and on the healthy side the respiratory murmur is uniformly louder than is natural all over. By carefully auscultating diseased cows from day to day, interesting changes can be discovered during the animal's lifetime. Frequently the abnormal sounds indicate progressive destruction; but at other times portions of lung that have been totally impervious to air, become the seat of sibilant r  les, and gradually a healthy respiratory murmur proves that, by absorption of the materials that have been plugging the lung-tissue, resolution is fast advancing. I have seen some very remarkable cases of this description.

Unfortunately, we often find a rapid destruction of lung-tissue, and speedy dissolution. In other cases, the general symptoms of hectic or consumption attend lingering cases, in which the temperature of the body becomes low; the animal has a dainty appetite, or refuses all nourishment. It has a discharge from the eyes, and a foetid, sanious discharge from the nose. Not unfrequently it coughs up disorganized lung-tissue and putrid pus. Great prostration, and indeed typhous symptoms set in. There is a foetid diarrhoea, and the animal sinks in the most emaciated state, often dying from suffocation, in consequence of the complete destruction of the structures concerned in respiration.

Treatment.—Stop all communication with the ascertained source of the disease. Do not disturb the cows from their byres, or the oxen from their stalls, as removing animals from their old quarters tends to spread disease, and does no good to the cattle. Allow water, feed judiciously, and give carbonate of ammonia, preparations of iron, gentian, or other tonics, sparingly.

Horse Hay-Forks, Grapples and Harpoons.

The subject of Horse Hay-Forks has been brought prominently before the public in the great "Auburn Trial" of mowers and reapers, and hay and grain harvesting implements, held in July, by the N. Y. State Ag'l Society, the report of which is just published, and recently by a trial of some 16 Forks at Rye, under the auspices of the American Institute Farmers' Club, the report of which appeared in the *American Agriculturist* for April, page 127.

In common parlance, every thing used to pitch hay off a load is called a fork, though

Fig. 1.—GLADDING HORSE HAY FORK.

some have not the remotest resemblance to that implement in its normal form. They all, that will work at all, present to the farmer the great advantage of being able to do this fatiguing and lung-trying work by horse-power, and very quickly, all, with proper appliances, carrying the hay up into the ridge of the roof and along to where it may be wanted. Some are arranged expressly for, and sold with these "travelers," others with or without the ropes and blocks (pulleys) needed in the simplest operations.

We observe three very distinct varieties of hay pitchers, namely: *First*, the forks proper, illustrated by figures 1 and 3, having long or short straight handles, or short handles at right angles to the direction of the tines; *Second*, the "grappling forks," or grapples, which are like two forks working together, and grasping their load between them, one of these is shown in figure 5, but they vary exceedingly, having 4 and 4 fingers, or tines, opposed to each other, 3 and 3, 2 and 2, 1 and 1, 1 and 3, 1 and 2, respectively; *Third*, Harpoons, shown in figures

7 to 14. These are a comparatively new invention, and their introduction struck dismay into

Fig. 3.—THE PALMER FORK.

the hearts of patentees of some of the good old horse-forks, but they are more limited in their application than was supposed. The principle on which they work is obvious. They are thrust perpendicularly into the hay, then opened, exposing the barbs or shoulders of the head or spurs, as a spear or harpoon, which lay hold upon the hay when the upward draft comes.

When one buys such a tool, he should study beforehand what uses he wishes to put it to.

If he pitches chiefly timothy and clover hay, or any long, coarse hay, of which he can, without difficulty, take up heavy forkfuls with the common pitch fork, then let him think where he wishes to pitch it, if over the great beam, or into windows from the outside, or from the barn floor a long way back. If he has much short, fine hay to pitch, he should be aware that the harpoons and grapples with few fingers are less adapted to do this work than other kinds of forks.

If he wishes to use his hay fork for loading coarse manure, certain kinds are very well adapted to this work—and these in turn are usually not so rapid at unloading coarse hay as others. Loose straw and grain, as oats and barley, are best handled by grapples, though the true forks manage them very well, and on the whole, we think that for definite cuds, each kind

Fig. 5.—THE RAYMOND GRAPPLING FORK.

of fork has its especial claims upon the farmer.

Fig. 1 represents the Gladding Fork, as made by J. L. Mansfield & Co., Clockville, N. Y.,

price \$11. This fork took the first premium at the Auburn trial, and is well adapted to all common purposes, will take its load over high beams into windows, and other narrow places, takes up a good load, though not very large, and is easily tripped. The rope whereby it is tripped passes through the handle, and is attached to the catch which holds the head in position. The handle being hinged upon the cross head, when tripped, the head drops, depositing its load as shown in fig. 2. An iron brace may be and is attached, which supports the long handle in a nearly horizontal position when not loaded. This is a slight modification of one of the original styles of horse fork, which was simply a large fork, such as this would be with a fixed handle. It was loaded as this is, the man on the load holding the handle down by means of a cord attached to the end, thus balancing the load, and when he wished, he dropped the hay by letting go the cord, when the handle would fly up. There were many objections to this form, chiefly obviated by the Gladding fork.

Figures 3 and 4 represent the Palmer Fork (price \$12, with pulleys). This took the first prize at the recent Farmers' Club trial. The tines are sickle shaped, and the short handle fixed in the head piece. When the fork enters the hay, it is in the position shown in figure 4; it is loaded by pressing the bail forward or the handle backward, so that the hinged-brace becomes straight and rigid, and holds the fork in the position shown in figure 3. Thus it is lifted, and the load is dropped by drawing upon the trip cord, which causes the brace to double up, and lets the handle up and the tines down, dropping their load. This is an excellent and useful implement, adapted to all varieties of work, well made and easily operated, and is found in most well furnished agricultural implement stores.

Fig. 5 shows Raymond's Grappling Fork, made by Chapman, Hawley & Co., Utica, N. Y. (price \$20). This implement took the second premium at the Auburn trial, and also at the Farmers' Club trial. It is loaded by being lowered down upon the hay, and will take up a pretty good load if simply lifted, each head should, however, be shoved down into the hay, which they enter easily. The heads draw together when they rise, and the load is dropped by drawing the heads apart, by means of the cord and lever seen upon one side. The arrangement of the three pulleys, etc., looks a little complicated, but it is easily managed. The pulleys may be set at any distance apart, and the hay conveyed to the extreme end of the barn before it is dumped. This attachment, indispensable to this one, is applicable to any fork, and enables a single horse to move forkfuls which he otherwise could not lift. This fork is said to be especially good for loading manure, and it works well in oats, barley and rowen hay. Fig. 6 is a clamp or grapple for attaching the pulleys to the rafters, an exceedingly simple

Fig. 6.

Fig. 7.

Fig. 8.

and efficient little affair. It is lifted to its place, and detached, by means of a pole with an iron

Fig. 9.—SPROUT'S FORK. —Fig. 10.

head adapted to the purpose, and might be useful for many other things about the farm.

Figs. 7 and 8 represent Blodgett's Harpoon Fork, (made by C. C. Blodgett, Watertown, N. Y.), which received the first prize in the class of Harpoons at the Farmers' Club trial. It consists of a smooth shaft like a gun barrel with a pointed end, out of which, by a simple mechanism, two prongs or "cat's claws" are thrown, when the implement has been thrust down into the hay. Our figures were made from very poor engravings, but illustrate the principle. An improvement has been made which does away with the lever and pulley outside the shaft, and brings the machinery necessary to throw out and draw in the "cat's claws" all within the ring-handle to which the lifting rope is attached. This is apparently simple and strong, not so long as many of the harpoons, but is capable of lifting very heavy forkfuls.

Figs. 9 and 10 exhibit Sprout's Harpoon Fork and Hay-knife, made by A. B. Sprout, Muney, Pa., (price \$9 for fork alone, \$11 for fork and 3 pulleys). This is a remarkable implement. It consists of two flat pieces of steel working together, being riveted like a pair of shears, (in fact Mr. Sprout claimed at Rye that they were

Fig. 11.—WALKER FORK. —Fig. 12.

good to trim trees and hedges). The rounded points of these are ground sharp, and are notch-

ed an inch or inch and a half above the ends as shown in the cuts. When the blades are closed together, the implement enters the hay with great ease, it is then opened, as shown, and will lift very heavy loads, carrying them securely. The report of the Committee at Auburn commends this fork highly, making an award to it, equal in amount to a second premium, and states that it picks up scattering hay upon the floor, "better than either of the other forms." It received the second prize in its class at the trial at Rye. This "Fork" (more knife, or pair of shears,) is an excellent hay knife, and might be no bad investment if bought for this purpose alone.

Figs. 11 and 12 represent the Walker Harpoon Fork, made by Wheeler, Mellie & Co., Albany. (price \$10 and \$1 each for pulleys). This is also a harpoon, entering the hay like a spear as in fig. 11. The head is turned to one side by means of a lever, as shown in fig. 12, and when the load is lifted and brought over the right place, a jerk on the trip-cord, causes the head to resume its former position and the load falls. On the whole a very neat and efficient tool, lifting immense forkfuls, and easily worked.

Figs. 13 and 14 show another very simple harpoon, made by the Ames Plow Company of Boston, and of 53 Beekman St., New York (price \$5). It was not well operated at Rye, but lifted good loads, and was apparently not hard to work. Its construction is exceedingly simple, being a straight harpoon with a movable shield, covering the barbs, which is shoved down when the fork is loaded, after it has entered the hay, and drawn up, crowding the hay off from the barbs when it is unloaded. The workmanship is excellent, and, with one or two slight modifications, we think bids fair to become a favorite.

Any of these forks would be, at least, awkward things to have fall from the top of the barn upon the mow where men were mowing away hay, or upon the cart, and there is not the least danger of such a catastrophe if they are well secured to the lifting rope. Careless hands frequently endanger their own lives and those of others by either not knowing how or not half doing a job. It is best always to tie a regular bowline knot (figured on page 305, October, 1855) this is perfectly secure. In dragging down over the beams most of these forks present themselves very awkwardly to the man on the load. In fact it almost makes one shudder to see such a sharp edged affair as Sprout's come swaying down, performing girations about a man's head. The simply sharp pointed ones are bad enough, but when it comes to two-edged swords we can but utter a word of warning.

TWO—OR TEN PER CENT ON INVESTMENTS?
—It is estimated that the property invested in agriculture does not pay over two per cent. interest annually. This may be near the truth for the whole country. The property embraces vast tracts of wild land that pay nothing, and in the southern parts of the country large dis-

tricts that are barely scratched by the plow, paying much less than two per cent. For the northern States the estimate is much below the truth. There are, possibly, farmers here who do not get two per cent. a year on the cash value of their farms, yet we think them rare. There are others who make their farms pay seven per cent. and more, but these are also exceptions. The farms of the northern States probably do not pay much over four per cent., but this is owing more to the way their capital is invested than to any defect in the business. Full one-half of this capital is invested in land that is not used, and so does not pay any interest. If one-half of a man's farm is in woodland that he does not need for timber or fuel, in swamps, in pastures that are not grazed, so far as immediate returns are concerned, he might as well be without it. Land pays no interest that has not capital and labor expended upon it. If this change were made, and the dead capital were made active, the farm would pay better than bank stock. The smallest, best worked farms pay best. Good gardens pay twenty per cent.

A Poultry Fancier's View.

BY A. M. DECKER, GLENS FALLS, N. Y.

My belief is, that with judicious management, there can be made a clear profit of from two to five dollars on each hen. The first question which arises is, "What breed is the best?" As for me, I put the Brahma Pootra, with its large size, rich feather, and quietness, ahead. If I could keep but one kind it should be the pure Brahma. They will not get over a common fence, are always at home, and together. The chicks are very hardy and sure to live, which can not be said of most other pure breeds. Brahmas will keep a family in eggs the year round better than any other fowl, if provided with good quarters.

Next to the Brahmas, I put the White Leghorns, then come the White-faced Black Spanish, Sicilians, Golden Penciled Hamburgs, and Silver Penciled Hamburgs. These six varieties constitute my choice. There are other breeds, perhaps, equally as good, but none better.

I can not put the Spanish ahead, unless it might be for a warm climate. I am a fancier of the pure White-faced Black Spanish, but more for fancy than profit. They lay the nicest eggs of any fowl and a great many of them, but

Fig. 1.—PERSPECTIVE ELEVATION OF FOWL HOUSE.

their long and continued spell of moulting in the fall takes off a great deal from their good qualities, besides they are too tender for a cold climate, unless one has pride enough in them to keep them in a warm place, which is very essential in making fowls of any kind lay in winter. I have a plan for building a very cheap poultry house, which I submit to your readers.

It is 60 feet long and 12 feet wide, divided into six different apartments to keep the different kinds separate. A is the laying room, B, roosts, C, scratching room, etc., E, door. The parti-

tions should be of lattice work, the building filled in at least six inches with saw-dust or tan-bark (roof and all). Yards to be made in front in proportion, double windows. These rooms are suitable for from six to twelve fowls, which is as many as should ever go together, they will be found more profitable than a large flock. Fowls kept in such a house and provided with a variety of food—grains of different kinds,

Fig. 2.—GROUND PLAN OF FOWL HOUSE.

boiled potatoes, meat, gravel, lime and ashes, they will do about as well as if running at large, destroying your garden, and doing more damage to yourself and your neighbors than they are all worth. I would also paint the roosts, etc., occasionally with gas tar, which is a sure cure for vermin. If not put on too thick it will dry in a short time. It also keeps the fowls healthy.

The manure will (if taken care of) nearly pay the care taken in their keeping. It should not be allowed to remain a great while in the house.

The Culture of Indian Corn.

The culture of Indian corn is to be undertaken not alone because it is profitable to raise the grain for sale, or for feeding, but because it is one of the best crops we have to subdue weeds, and to amend the soil by the thorough tillage which it requires, and which it enables us to apply with profit. In fact, for many eastern farmers, it is this consideration alone which gives a margin for profit in connection with the corn crop. How mistaken then is the practice which half does this work. In the vicinity of railroads, by which we can obtain western corn, where land is worth 100 to 150 dollars an acre, and where manure is worth \$2 an ox-cart load, no man can afford to raise corn, except as a cleaning and tillage crop as part pay for labor.

The accompanying engraving is made from a drawing sent us by a subscriber who has used the implement it represents with satisfaction. It is a harrow for going astride the rows of corn and destroying the weeds while yet the corn is very small and liable to be covered up if the cultivator teeth were used. The teeth are of square iron, the beams of 4 x 4 stuff, 4 feet long,

CORN CULTIVATOR.

connected at both ends as shown; at the rear, the teeth are brought within one foot; at the front they are spread 3 to 4½ feet apart. There are several holes in the front cross-piece which allow of adjustment to sweep different breadths. The two cross-pieces connecting the beams are elevated respectively 4 and 8 inches above them, and raised high enough to clear the corn. They are banded at their ends and bolted through the beams with bolts strong enough to stand any ordinary strains. The implement strikes us as an efficient one, but requires two horses, and these should draw upon a pole. It is especially useful when the corn is very small and most in danger from weeds and grass.

A New Way of Trapping Rats.

BY L. L. LANGSTROTH, OXFORD, OHIO.

Get a common round wire-trap. Bait it with the most inviting food, and wait patiently until a rat is caught. Instead of killing this rat, and waiting perhaps for weeks before you are fortunate enough to trap another, keep him alive and feed him much as you would a pet squirrel. In a few days he will become quite reconciled to his cage, and you are now ready for business. At night, bait the trap well and set it where the rats resort most. Some one or more of them, seeing a rat quite at home in the midst of plenty, will enter the trap without any suspicion of harm. Next morning, pump or pour water thoroughly over the trap to clean it, and to make the killing of your prey more easy. Have an empty barrel into which drop the contents of your cage; the prisoners being well soaked, will be so heavy and slow that you can easily knock them on the head. Treat your partially tamed rat, however, "as if you loved him," and return him to his cage; this is easily done by lowering the cage into the barrel. Repeat the operation from night to night, and you will be surprised to see how easy a matter it is to outwit so cunning an animal as an "old rat."

Be careful not to keep a large one for your tame rat. He will frighten off all the younger fry, as none of them will dare to enter. The only difficult thing in the matter is to get your first rat. I have had a wire trap well baited for weeks before I could entice one to enter it. To get the first, is something like Astor's recipe for getting rich: "Get a thousand dollars clear of the world, and it is all very easy." Since I caught my first rat, I have failed but once for many nights in getting from one to four to keep him company. If your readers will try my plan, I think that something may be done to abate one of the most intolerable nuisances of this country. To say that millions of dollars worth of our property are annually destroyed by rats, would not be an extravagant assertion.

Foot Rot in Sheep.

This distressing and destructive malady is seldom properly understood or treated, and the result is that, though checked, it breaks out again and again. This is because so few farmers read and inform themselves thoroughly about their business, and because even those well informed perform surgical operations in so careless a manner. In the April number of the *American Agriculturist*, we explained the structure of the sheep's foot and the origin of the disease known as the *fouls*. This never need be confounded with foot rot, though we doubt not it is often the precursor of it, for it puts the foot in excellent preparation to take it easily.

Contagiousness of Hoof Rot.—There are some medical men, we believe, who deny that any disease is contagious, and they deny the contagiousness of hoof-rot. They are, we presume, right just so far:—were a perfectly healthy foot, sound and clean, to be exposed to the contagious virus, it would probably escape; if, however, it were anywise sore, inflamed or wounded, it would probably take it at once. The disease is often long in reaching that point which causes the sheep to go lame, and it progresses gradually, first causing limping; then the lifting of one foot; then severe lameness of both forefeet; then going upon the knees, which brings the feet in contact with the breast. It does not involve other parts of the system until far advanced.

Then the feet become masses of rottenness; maggots breed in them and work into the flesh, and this corruption is communicated to the breast. During the whole course of the disease, until near the last, the sheep has good appetite and digestion, and is in no other way affected.

On this account the cure is, theoretically, very simple and sure. In practice, it is just as simple, if thoroughly done. The well cleaned hoofs, softened by soaking in dewy grass or on a rainy day, or otherwise, are pared with cutting pliers and very sharp knives until every particle of diseased matter is taken away, even if it involves the removal of all the hoof; they are then washed with warm water and soap, and smeared with some caustic paste, or fluid, or the sheep forced to stand in a hot, saturated solution of blue vitriol for ten minutes.

In discussing the origin of hoof-rot, most writers take sides, either denying its contagiousness, or asserting it most vehemently. For ourselves, we can see no other sensible belief than that it may be originated whenever the hoofs, being softened by moisture, are penetrated by foreign substances like gritty soil or sand, and especially when such things, finding their way through cracks in the hoof, thus come in contact with the sensitive lamellæ, or the papillary tissues, where they induce acute inflammation. The natural growth of the hoof adapts it to the wear and tear of gravelly and rocky hill sides, and on such localities the outer walls wear off fast, so that they are nearly even with the sole, and the foot is neat and trim; but on soft ground, in stables or in yards, the growth of the outer walls is so much more rapid than the wear, that they grow long, curl under the sole, and turn up in front, throw the wear back upon the heels, and keep them more or less inflamed, and are themselves liable to cracks and splits, which, if foreign substances work in, readily involve the sensitive portion of the hoof in inflammation. Where the horn-forming tissue becomes inflamed, the character of the horn formed is changed; its quantity is greatly increased, but it is softer, owing to the mixture of pus and foreign matter, and in portions has a fungoid appearance. The walls of the hoof become detached from the foot in spots of larger or smaller extent, owing to the fact that as soon as the lamellæ become diseased the horn they secrete has no consistence, and hence the walls have no hold upon the foot. The pus which constantly exudes from the sores has the quality of inducing the same disease, if it comes in contact with inflamed or wounded surfaces of the feet of other sheep. We see, then, good reasons for the views that the hoof-rot originates only in wet locations, or on ground which is not dry, and where sheep's hoofs are liable to crack from over-growth and softening by water, and exposed to grit, and that where the malady is otherwise unknown, it may be communicated to a sound flock by the introduction of one sheep having the disease.

Cotton Culture.—(Continued from page 136.)

BY F. G. DWIGHT.

COTTON COMING.—If a warm rain sets in immediately after planting, your cotton rows will, in about a week or ten days, be well marked; and the chances of a "good stand" will be discussed; then, too, the tell-tale plants will betray where there has been careless dropping.

By having the plants in a straight line, instead of scattering from three to six inches in width, all the after work would be easier. Siding

and plowing could be more effectually done, and the whole field have a neater appearance.

When there are heavy rains, followed by much wind and a bright sun, directly after planting, and any part of your land is of such a nature as to form a crust on the surface, it is sometimes necessary to go over it with the scraper, to break up and "knock off" the thin crust formed on the surface, so that the young plants can push their way through.

This practice, however, cannot be recommended; cotton is not or should not be covered so deeply as to admit of much scraping off after the beds are leveled in the first place at planting. In any event, judgment must be exercised to know when such a scraping might be injurious to the seed row, by cutting off the tops of the young plants, should the seed have been in the ground long enough to be sending up young shoots, and any meddling with the surface does more harm than good. When any danger is feared from such a crust, an adjustable horse hoe run between the rows will be found sufficient to break up or crack the surface, and permit the plants to force their way through.

FIGHT GRASS.—Should, however, the young grass and weeds come up so thickly, four or five days after planting, as to threaten to overrun the beds and choke off the young plants as soon as they appear, it is best not to delay one hour in commencing to "fight grass," but to run the wooden scraper, in the hands of a careful man, over the beds, and "knock off" *very lightly* this first coat of weeds, etc., even at the risk of breaking off some of the forward plants near the surface. The hoes, plows, sweeps, and horse plows must be kept moving—judiciously—over the fields, early and late, as long as and wherever there is any grass to kill.

CLEAN CULTURE.—Upon the clean cultivation of your cotton land depends, in a great measure, the success of the crop. Let none of your hands forget that the ground must be kept stirred, and that every single weed and blade of grass must be cut up, and demolished.

A COTTON PLANTER NEEDED.—Perhaps no other improved implement in the cultivation of cotton is so much needed as a good one-horse planter, of simple and durable construction. Much labor, not only in planting and covering, but in all the after cultivation—"chopping out," "siding," etc.—would be saved by such an implement. If the seed could be sown *straight* in one continuous row, the seed not more than two or three inches apart in the row—so as to be sure of a "stand," the process of "chopping out" would be simpler and require less care.

The difficulties that might be experienced in dropping cotton seed through a planter, would be owing to the lint that covers them, causing the seed to hang together in bunches. But by rolling in ashes, as recommended, this difficulty may be somewhat overcome, and enable the seed to be dropped through a small opening or tube, with more certainty. The sales for such a planter would be immense, and make the inventor rich. May we soon see it in the field.

CAUTION.—Never work cotton during a spell of rainy weather, unless you are behind-hand with the work, and must take advantage of every moment in fair or foul weather to "catch up." You can not effectively kill grass in wet weather; you may plow it around, push it about and turn it upside down—but your plants are only partially relieved; the moist soil and warm rains enable it to take a fresh hold the instant almost that it is uprooted.—Hot, sunny weather, is the best time to work among cotton

—no matter how hot,—then all grass turned up or displaced only partially, and buried under the burning sand, will be effectually disposed of.

CHOPPING OUT.—It is a common rule, not to begin working cotton until the greater part of the young plants can show *two pairs of leaves*, mostly when they are four or five inches in height. But if the grass is very rank and threatens to outgrow the cotton, it will be prudent *not to wait for four leaves*, but to open the fight at once; even though the plants are but two or three inches in height and have but two leaves.

The first work then in order will be "chopping out," or scraping out of the rows some of the over-abundant plants that have come up too crowded, giving them a careful thinning wherever they stand in bunches, to prevent a spindling, and consequently delicate growth.

At the same time scrape off and pull up all the grass around and among the plants; and let the sweep follow the hoes, running through the middles to destroy the grass not reached by the hoes, and to throw a little loose soil toward the plants, using care not to cover them.—For this a horse-hoe or cultivator is well adapted; it should be used by a careful man and run along lightly.

The hoe hands confine their labors only to the grass in the immediate vicinity of the rows, about and among the plants, leaving the middles for the sweep or hoe-harrow.

It is not advisable to remove many plants at this first working, except where they are much crowded; a late frost may nip many of them, or early grasshoppers may thin them out, so that if the hoe hands remove too many, the chances of a "stand" may be endangered.

SIDING.—After all the fields have been gone over with this first operation, it will be found necessary, in consequence of the rapid growth of weeds and grass, and to keep the soil well stirred, to at once proceed with the next work.

The small turn plows are now run along *close* to the young plants, up one side of the row and down the other, as near as an average of three inches, throwing a light furrow away from the plants towards the middle of the space between the rows, covering the grass, and leaving the plants on a slight elevation or ridge. Be careful not to run the plows too deep, as there is danger of hurting the roots; besides it is an injury to the young plants to set them up too high and dry on a sandy ridge,—the hoe hands may not come along for a day or two, and the hot withering sun may dry out the tender roots.

Do not let the ridge—made by the plows (run up one side of the row and down the other)—be cut *too narrow*. The plant has not only a tap root, but numerous fine and delicate side roots, that in young plants are hardly noticed. These tender feeders are of vital importance to the growth of the stalk, and none of them can be rudely cut or broken without proportionately injuring the plant itself.

After the plows have sided the rows and left the plants on a ridge, the hoe hands come along as soon as the work on hand permits,—the sooner the better,—and scrape off the grass remaining on this plant ridge; at the same time chopping out and again reducing the over-abundant plants, where they stand too crowded, and endeavoring as much as possible to have the plants standing in the rows at intervals of six or eight inches, in pairs, or three or four near together, always cutting out the weaker and letting the strongest plants stand, at the same time leveling the ground about the rows and drawing up soil to the stems, where the plows in "siding" have run too close to the plants or too deep.

A Look into the Sea.

Those who live at the sea side have an opportunity to observe forms of animal and vegetable life which, to those residing far inland, must seem very strange. Indeed those who live upon the very beach overlook many of the curious forms that grow near them. These animals and plants are best observed when grown in a glass tank or aquarium, and we have in our seaboard towns many who devote much time to marine aquaria. Our Superintendent of Engraving is well known as an enthusiast in this way, and he is so much pleased with an aquarium of one of his friends that he has produced a beautiful picture of it, presented on the succeeding page, and has furnished us with the following note of its contents: "The engraving represents the interior of an aquarium in the possession of Mr. W. E. Damon, and gives at one view a number of remarkable forms of animal life that are but little known. The two prominent figures in the center of the aquarium are Sea Anemones. These belong to the class of Polyps, and are two of the finest species found on our coast. It is almost impossible to describe the beauties of these flower-like gems of the ocean, nor is it strange that they were considered for so long a time as marine plants. Their tentacles expand like the petals of a flower, and at other times they remain closed for hours, only to seem more beautiful when again opened. On account of their bodies being coated with slime, and being of a soft pulpy nature to the touch, they are named by our fishermen "Halibut slime," and are brought up on the trawls in large numbers, they are attracted by the bait, and the fishermen imagine that they are the slime from the bodies of the Halibut. It is only in still water and in perfect security that they unfold their thousand tentacles, and display their beautifully organized disk. Each tentacle is a hand, by which it can seize any small fish, and convey it to its mouth; if the fish is strong and hard to hold, the Anemone will bring every hand to bear, so that the fish is entirely surrounded and held fast till dead, when it will slowly disappear into the mouth and down one of the many stomachs of the Anemone. Their manner of reproduction is very curious—they throw off a piece from the base. I have often cut pieces off with a penknife, which in about two weeks became perfect Anemones, but always having only six tentacles, which, in the course of time, increased to the proper number. Another way of multiplying is by budding off from the sides of the stalk (as shown in engraving.) These buds fall off from the parent, make an attachment on some stone or shell, and in course of time become perfectly organized Anemones. They also reproduce by ejecting young from the mouth or orifice at the disk. Two smaller varieties are also figured, of great delicacy and beauty.

The fish shown in the engraving is the Stickleback (*Gasterosteus*), and one of the most lively and interesting fish known for the aquarium.

The male fish, about the month of March, begins to take on the most brilliant hues, of blue, orange and green; it then commences to build its nest for the reception of the spawn. As soon as the female has spawned, she is driven away by the male fish, who carefully guards the nest, and ventilates the spawn by ejecting water from his mouth into one of the orifices of the nest. I had one Stickleback that every day, as the sun reached a certain spot in the tank, would take the spawn out of the nest and give it a half hour's sunning, then take it back and deposit it in the nest, and when the young were

[COPYRIGHT SECURED.]

INTERIOR OF A SALT WATER AQUARIUM.—(See preceding page.)—Drawn and Engraved for the American Agriculturist.

hatched out and wandered too far from the nest, would take them in his mouth and bring them back. I have often amused myself by placing small sticks in the nest, and watching the male fish tug at them until they were loosened, and then carry them off in his mouth to the farthest extremity of the tank. There is no fish so easily domesticated, and that will bring forth young so readily in either fresh or salt water aquarium.

At the left of the picture is a most curious animal, the Sea-horse, (*Hippocampus Hudsonius*).—The male fish is furnished with a pouch for the reception of the spawn, in which it is hatched. The young sea-horses cling together in a mass, by means of their prehensile tails. The natural food of the Sea-horse, is the Serpula, noticed below. Mr. Damon had for a year three Sea-horses which were so tame, that they would follow his hand around the tank to be fed; he at first fed them on the hinder parts of shrimp, afterwards on Serpula, which they eat greedily.

Serpula contortuplicata, shown near the Sea-horse, consists of a mass of twisted tubes formed of hard shell, each of which contains an animal. When these are out feeding and fully expanded with their "stoppers" of white and orange, in connection with their feathery like branchiæ of rich brown and crimson, they present a body of rich color. On the slightest

disturbance, the entire mass of serpula disappears, and the color of the whole instantaneously changes from a brilliant orange or crimson to the dull grey of their cells. They venture out one by one and the mass of shell becomes brilliant again. When any of the cells become broken, the serpula in a few days build them up. If one is cut in half, each half becomes a perfect animal. They live entirely at the bottom, and do not thrive well in a strong light.

Star-fish, one of which is shown at the left hand, (*Asteracanthion*), are very common, and the great enemy of the oyster and clam. Every fisherman considers it his duty to destroy them.

The small Hermit Crab (*Pagurus longicarpus*) is found in great numbers on our coast. The hinder part of the body is soft and unprotected, so that it becomes necessary for them to inhabit some empty shell, generally that of the Buccinum, when they grow too large for the shell, they take possession of a new one that fits them better; when they are about making this change, they first carefully examine the interior and exterior of the shell with their claws, and finding it all right they jerk themselves out of the old shell and into the new so quickly, that the change is hard to detect. Should a Hermit Crab have one of his claws crushed or broken, it will amputate it down to the next perfect joint, eating

all the flesh that is torn off through amputating. In about three days, a small, soft fleshy point makes its appearance, which is the new claw; this increases in size until it has attained nearly its natural proportions, but is soft and without shell, until the next moulting or shedding season, when it becomes a perfect claw, shell and all. One of these Crabs, inhabiting a small shell, is shown in the center foreground of the picture.

The Spider Crab, or Sea Spider, (*Labinica canaliculata*) is interesting, in spite of its homely look, of which it seems to be conscious, from the fact of its dressing itself up with sea-weed or algæ, of the most brilliant colors. This it only does at the fall of the year, as the bedding time approaches, so that it may bemoire securely hid from the numerous bottom fish who prey upon the smaller crustaceans. One is seen at the extreme right of the picture. There are several equally curious objects shown, that can only be named: The Shrimp, which the Stickle-back seems to be after; Tubularias, long horn-like tubes, seen just under the Shrimp; Barnacles, between the two Crabs, etc. Of course, there must be some vegetation to keep up the balance between animal and vegetable life, and for this nothing is so useful as the *Ulva*, or Sea-lettuce, some broad fronds of which are seen floating behind the Sea-horse and Serpula.

The Silver-Striped Bamboo.

The name Bamboo is associated with the gigantic tropical and subtropical grasses, the stems of which grow 50 feet or more high, and are celebrated for their general use by the Orientals, to whom they serve for everything from a penholder to a mast. There are, however, some very humble bamboos, and at least one hardy one. *Bambusa Metake*. This is a Japanese species, two or three feet high, and endured the winter with us several degrees north of New York City. Recently Mr. E. Bauman, Florist and Landscape Gardener at Rahway, N. J., has brought to our notice a still more dwarf species, which has been introduced by the European florists under the name of *Bambusa Fortunei alba vittata*. The engraving is made from a pot plant, of the natural size. From the abundance of buds at the base it is no doubt a vigorous grower, and is said to continue dwarf and stocky and not exceed about a foot in height. Should this prove hardy, as Mr. Bauman thinks it will, it will be a valuable addition to our "foliage plants" of which we now have a great number, with but few hardy ones. The leaves are very distinctly marked, both the green and the white stripes being clear. The plant is apparently well adapted to form edgings in decorative planting, and a single plant would prove very ornamental in the border. A variety with green and yellow stripes is noticed in Europe, and either this, or the one under notice, is advertised as *Bambusa Japonica variegata*. There is much confusion in florists' names, both in this country and Europe.

The Sex of the Strawberry.

From the fact that there are some varieties of strawberry, which, being pistillate, require the presence of some other sort to make them fruitful, many suppose that it is necessary in all cases to plant two kinds in order to bear fruit. We have several letters asking what variety should be planted with the *Triumph de Gand* and other sorts that will fruit without aid. As this matter of the sex of strawberries has been muddled so much, we will try to make it plain. The great majority of flowers with which we are familiar, are perfect, i. e., have both pistils,

Fig. 1.—PERFECT FLOWERS.

the organs that are to become the fruit, and stamens, the fertilizing organs, in the same flower.

Other plants constantly have their stamens and pistils in separate flowers of the same plant, as the cucumber, squash, and all of that family—and the Indian corn, in which the tassel contains the stamens, and the ear the pistils, the

SILVER-STRIPED BAMBOO.

elongated portion of which is the silk. In still another set of plants the flowers of one will bear pistils only, and the flowers of another will produce nothing but stamens. The hemp, hop, and willows are common instances of plants of this kind. The pistils, in each one of these classes are the portions that become fruit,

Fig. 2.—SECTION OF FLOWER.

but they only do this after they have received the influence of the pollen, a fine dust produced by the stamens. The pistils of perfect flowers, that have both stamens and pistils, may readily become fertilized by the pollen of the same flower, while in separated flowers, those in which the stamens are in one and the pistils are in another, no fruit will be produced unless pollen is brought to the pistils by some agency, such as insects or winds, from a staminate one. Some plants that ordinarily produce perfect flowers do sometimes have separated ones, the stamens and sometimes the pistils being suppressed or abortive, when the flower becomes pistillate or staminate as the case may be. This happens in both the wild and the cultivated state with the strawberry and with the grape. In the strawberry it is usually the stamens that are wanting, and in the grape it is more common to have the pistils absent, if either one. The engravings (figs. 1, 2, 3), of strawberry flowers, very much enlarged, prepared for Fuller's Small Fruit Culturist, show the different parts quite distinctly, and a careful inspection

of them will enable any one to tell a perfect—or hermaphrodite, as it is often called—from a pistillate flower. In fig. 1, the small knob in the center is the pistils, which are surrounded by numerous stamens. The same flower is shown in figure 2, as cut down through the center. The conical elevation in the center of this cut flower is the enlarged end of the stem of the flower, on which the pistils are placed, this is called the *receptacle*. The stamens are arranged around this, and outside of these the showy parts of the flower, the petals and calyx. As the pistils ripen, to produce the fruit proper—seeds we usually call them—the receptacle enlarges, becoming often of enormous size compared to what it was in the flower, and very often inclosing the seed-like fruits in deep pits or cavities, while in other cases these remain upon the surface. In several cultivated varieties of the strawberry, the stamens are altogether wanting, as in fig. 3, and then the plant is said to be pistillate. It is evident that plants of this character need the help of those that produce stamens. The general tendency of strawberry cultivators is to discard pistillate sorts altogether, though there are a very few, like Hovey's Seedling, that in some localities are so excellent and productive, that it is desirable to grow them. Where this is the case, it is only necessary to plant adjacent beds of some perfect variety that blossoms at the same time, and the insects and winds will look after the fertilization. When a perfect variety is planted to fertilize a pistillate or imperfect one, great care

should be taken to prevent the runners of one bed reaching across into the other bed. It is from carelessness in this respect, that there is so much confusion in regard to varieties, and this has also given rise to the common belief that pistillate plants become changed when fertilized by another sort. While we are not prepared to assert that the flavor of a pistillate sort may not be modified somewhat, according to the variety by which it was fertilized, yet we have no proof that the plant itself undergoes any change. To answer many inquiries, we may say that, practically, as far as the value of the fruit is concerned, strawberries in proximity do not mix. As regards the seeds, the case is different; here the crossing is the rule rather than the exception. And this is apt to take place even with perfect flowers, as insects

Fig. 3.—PISTILLATE FLOWER.

will often bring pollen and fertilize the pistils of a flower, before its own pollen is ready.

When the pistils are absent, making a truly staminate flower, of course no fruit is borne, and the plants are perfectly useless. They have been recommended for fertilizing the pistillate ones, but as this office can be as well performed by the perfect flowers—which produce enough pollen for their own pistils and to spare, it is a mere waste of ground to employ them. The term “staminate” is often applied to perfect flowers; it belongs to those only bearing stamens.

The Spring Adonis.—(*Adonis vernalis*.)

The names of many of our cultivated plants—if we trace them to their origin—take us back to the days of mythological fables, when gods and goddesses had the uncomfortable power of transforming mortals into beasts and flowers. The Adonis is said to be so called in memory of the young man beloved of Venus, and to have sprung either from his blood, or from the

SPRING ADONIS.—(*Adonis vernalis*.)

tears shed by the goddess at his death. Which is the true story of its origin, it is too late at this day to settle, but whether it was blood or salt water, we would like to see the plant itself oftener than we do. We only meet it in those gardens where good old things, that have been grown by lovers of flowers for centuries—and ought to be prized on that very account—have not been thrown aside for modern introductions. We like the new things too, but don't believe in discarding old friends to make place for them.

This Adonis is a hardy perennial, and comes in bloom with the flowers of May. Its stems are about a foot in height, and clothed with delicate and finely cut foliage. Each branch is terminated by a large yellow flower, the petals

of which are marked with greenish lines. The plant belongs to the same family with the Buttercups, Pæony, etc.—the Ranunculus or Crow-foot Family. In looking over the catalogues to see if the seeds were generally kept by seedsmen, we were surprised to find it only in that of Jas. Vick of Rochester. Being a perennial, it will not flower the first year from seed, but after that it is easily managed, it being only necessary to divide the clumps when they get too large. There are some annual species that are worth cultivating. One of them, *Adonis autumnalis*, blooms in autumn, with a small dark red and purple flower and fine foliage. It has the popular name of Pheasant's-eye.

Tree Doctoring and our “Doctrine.”

Just now we have “no end” of circulars of “Patent Tree Invigorators,” “Apple worm Annihilators” and the like, with many letters of inquiry. These tree medicines divide themselves into two classes, those that are put *into* the tree and those that are put *on* the ditto. The internal remedies proposed to drive away worms are sulphur and calomel. A hole is to be bored into the tree, the stuff introduced and the hole plugged up. Some ask us if the use of these materials will hurt the tree. Probably no more than if the hole had been entirely filled by a nicely fitting plug—as both are very insoluble—and the amount of benefit would in either case probably be about the same.

The external remedies are more numerous, and are generally “patent” preparations. If there is anything too stupid to get a patent we should like to see it. What principle governs the issuing of patents we are at loss to discover—except it be a general desire to get the fees, and be rid of bores. In the circulars before us, one proposes to “treat” the trees to rid them of worms, and will send the article for a consideration. Another not only kills the borer, but his medicine contributes to the growth of the tree, and so on. Now on general principles we don't believe that there is any *specific* virtue in them. The whole secret of their success lies in the fact that one who has invested money in them *will look after his trees*—while if we tell him month after month to use soft soap wash and other simple remedies, he will not think it worth while. There is nothing like a few dollars, to wake up some people. We copied last January a communication from the Country Gentlemen, of Mr. Wisner, who had used Mr. Sheldon's composition to the injury of his trees. Mr. Sheldon writes that Mr. Wisner admits to have made the composition with the wrong ingredients, and we give him the benefit of this statement. With our present information, “certificates of well known persons” included, we can see nothing to induce us to recommend any of these patented or secret things whatever. Our doctrine is constant attention. If one loves his trees and looks after them, he will not need any “annihilator,” or “invigorator.” Give a soft soap wash in the spring, probe and kill all the borers that are in the tree, and keep others from entering by placing some mechanical obstruction around the trunk in July, either stiff paper, a mound of earth, or whatever will keep the insects away. If canker worms are in the vicinity, then something must be used to prevent their ascent,—see March *Agriculturist*. Tent caterpillars are easily kept down by destruction of eggs and nests—it is only lazy people who suffer. If a tree “invigorator” be needed, just try what virtue there is in manure.

Cultivating Orchards.

Apple orchards left to themselves bear only on alternate years, with such uniformity, that “bearing years” have come to be regarded as the order of nature, rather than a human device. The trees, in average soil, do not have alimant enough to give full crops every year. Cultivation and manuring will change all this, and give us remunerative crops every season. Possibly manuring might do this even if the orchard were left in grass. But the danger is, if the orchard is left unplowed, it will not get the manure.

The common objection offered to plowing is the damage done to the roots of the trees. We have no doubt that an orchard might be plowed so deep and so near the trunk of the trees as to damage it past hope of recovery. But discretion is to be used, and the plow is to be kept so near the surface under the trees, as not to break off the large roots. It has also been ascertained that grain crops are not good for orchards. We have known orchards to be made barren for several years in consequence of a crop of rye. Grain crops, unless buckwheat be an exception, take from the soil what the tree needs, and shade the land too much. Root crops are the most desirable, because they require a good deal of manure and thorough tillage to make them profitable. The frequent stirring of the soil, and the fertilizers, are the wants of the apple tree, and the root crop enables the farmer to give these to his orchard, and at the same time he is remunerated for his labor.

Potatoes, carrots, beets, turnips, are all good crops for the orchard, if you put on manure enough to make them pay. A surplus must be left in the soil to make the apple crop. But will an orchard thus fed bear every year? We have no doubt of it. The apple crop may be made as sure as the root crops. We once plowed up beneath an old apple tree that had an inveterate habit of bearing only every other year, and planted with potatoes, manuring liberally. We had a full crop of apples the second year, and shall always think the manure and the cultivation made the change. Horticulturists who make a specialty of apples, and manure every year, succeed in getting crops every season, with very rare exceptions. David Lyman, Esq., of Middlefield, Conn., stated, at a recent meeting of the State Board of Agriculture, that he cultivated his orchards, and got crops every year. They were not always full crops, but were enough to pay for the trouble. Judging from the appearance of his orchards, which we visited a few years since in the apple season, we think that a very modest statement. We have rarely seen so fine a show of apples, even at the county fairs, as could have been gathered from his trees. The secret of his success is cultivation and manure, and a reasonable watch against the encroachments of insects. The plowing late in the fall as well as in the spring, he thinks a great safeguard against their depredations. Multitudes of the chrysalides are unearthed and destroyed. If this was attended to, and the windfalls picked up and fed to the pigs, we think there would be little damage from the attacks of insects. The apple is so fine a fruit, and so easily kept, it is so much both food and luxury, that no pains should be spared to keep our orchards in the best condition. We are tired of seeing apples quoted at \$7 a barrel, but even at that price they are much cheaper than pills.

SWEET HERBS.—Those who like seasoning should not forget these little matters in “making

the garden." Sage is the staple article, and is so readily grown from seed that it is not worth while to make divisions or cuttings of the old plants, and the same may be said of Thyme. Make a seed bed of good light soil and sow Sage, Thyme, Sweet Marjoram, and Summer Savory, when the ground gets warm. Keep the plants well weeded, and thin if crowded. By the time that early crops of peas, cabbages, etc., come off, there will be a plenty of good plants to set out and occupy the ground, and give an abundant supply for home use and for sale.

Raspberries and Black Caps.

The great trouble with the cultivation of the common raspberries, even when they pass the winter safely by being protected or otherwise, is that the manner of growth is not understood. In private gardens we frequently see the raspberry bed a dense thicket, with new canes struggling with the old ones, and all in an uninviting and unfruitful condition. The majority of private growers do not seem to be aware that the stems of the raspberry are biennial, i. e., they grow one year and bear fruit the next, and then die. With some of the varieties called ever-bearing, the young growth flowers and fruits in the autumn of the same year. When a raspberry cane of the ordinary kind has fruited, it is no longer of any use, and should be cut out. The large cultivators usually leave the pruning out of the old canes until the time to cover them, but it is much better to remove them as soon as fruiting is over, to allow the new growth a plenty of room. Those who plant raspberries this spring, and wish the best results, should cut the old canes back to a few inches, leaving just enough to serve as a convenient handle in planting, and look to the new growth of this year to produce fruit the next. If the canes be left their full length at transplanting, a poor crop of fruit may be had the first season, at the risk of the future good of the plants. The plants are set four feet apart each way for the more moderate growers, and the taller kinds five or six feet apart. The varieties are numerous, and every year brings additions to the list. Along the Hudson River the Hudson River Antwerp is the great market berry. In Southern New Jersey, the Philadelphia is the profitable market fruit, and at the West, the Purple Cane enjoys great popularity. Choice sorts for garden culture are: Brinckle's Orange, Franconia, Clark, (said to be hardy,) Fastolf, and French.

The Black Caps, of which there are now many named varieties, are becoming very popular. Though not to be compared in flavor of fruit with the others, they have many good qualities. They are hardy, very productive, and throw up no suckers. They are propagated by rooting from the tops of the pendent branches. Of this class the Doolittle's Improved, is, perhaps, the best known, and doubtless many others, including native seedlings, are just as good.

Sweet Potato Culture.

BY W. W. RATHBONE, MARIETTA, OHIO.

In April, page 189, we gave Mr. Rathbone's manner of preparing the land for Sweet Potatoes, and now add the remainder of his article, upon setting the plants. The plants should always be set down to the first leaf, and if the upper portion is destroyed by a late frost, they will start from below and make a good growth.

The ridges being made, they will stand 30 to

36 inches from top to top; let them be sharp pointed. To mark the distances for plants, I use a revolving wheel, with fms every three feet, resembling a reaping machine fan, marking two rows at once. I keep the plants well set up on the ridge, and cut between them at the second and third hoeing to *make the hills*. Make the hills pointed and high. Do not be afraid of dry weather. We always get the best crops when "everything is burnt up."

MODE OF SETTING PLANTS.—One plant per hill is plenty. Put fifteen inches apart if to be kept in the ridge. I have two modes of setting. First, if the weather be dry, don't wait for rain, nor the "dark of the moon." Let one boy drop the plants, another pour from a water-pot, with the rose off, sufficient water to float the rootlets, and immediately fill up with mellow earth. One can water for three to set. Never set plants after heavy rains. A second method of planting, which I prefer when the earth is sufficiently moist, is to dip the roots in a puddle of clay of the consistence of thick cream. The plants thus treated generally live well, and the objectionable hard lump formed about the plants in many soils when watered in the hill is obviated.

AFTER CULTIVATION.—After every rain break up the crust of soil in contact with the plants. I do this rapidly with both hands—clasping, raising and pressing the earth on the tips of the hills. It answers all the purposes of a regular hoeing, breaking up the ant holes and giving health to the young plant. Keep the surface clear of weeds. Be careful in working among the plants, not to hoe too deeply. The earliest potatoes lie immediately beneath the surface.

After heavy rains the vines root at the joints. On sunny days they may be upturned on the hill or ridge. But in no case cut off the vines. I have cut every alternate row in a large patch to fully test this point, and on harvesting found fully 100 per cent. in favor of the uncut hills. A frost that merely blackens the *leaves* does not hurt sweet potatoes, but if the *vines* are frozen it does. Upon digging, the potatoes should be carefully handled and put away in boxes or barrels, with alternate layers of leaves, (some prefer cut straw,) in a warm, dry place to keep.

In conclusion, I repeat, if good plants are set as indicated, on moderately fertile land, with good surface drainage on small high hills, the surface kept well cleaned, any reader of the *Agriculturist* south of 45° north latitude can raise good Nansemond sweet potatoes.

THE AILANTHUS.—We hear so much against the Ailanthus, that we are quite disposed to take its part. It will grow every where, is a rapid grower, and is very seldom troubled by insects. We know that it makes good fuel, and we cannot see why its timber should not be useful for a great many purposes. We have had a couple of blocks upon our desk for some time, the one varnished and the other plain, and of the great many who have examined them, not one has guessed the kind of wood. Its disagreeable quality is an unpleasant odor when in flower, and its great nakedness in winter renders it less suitable as a wind-break than many others. Despite all the abuse it has had, were we upon a tree-less prairie, we should plant the Ailanthus, notwithstanding it has been condemned by several pomological societies. It is the tree that converts the brick and brown-stone streets of New York into beautiful avenues of tropical foliage, it grows among the pavements as if it rather enjoyed a hard life, and it is especially adapted to rocky and sterile soil.

Cranberry Culture.

To answer numerous letters we condense recent articles upon this subject, some of which came to us, and others appeared in papers, published in New Jersey, a State some portions of which present remarkable facilities for cranberry culture. The essentials seem to be, 1st, a sandy peat soil; where the deposit of peat or muck is shallow, with sand beneath, then a proper soil may be made by plowing. If the peat is very deep, then sand must be put on to the depth of four to eight inches. 2nd.—The bog must be so situated that it can be drained, ditching is the common method. 3d.—The land must be capable of being flowed at will. This is not considered so essential in New-Jersey, as the other two conditions, but is considered desirable as a means of protecting the vines from frost and insects. 4th.—The land must be cleaned of all stumps as well as tussocks of sedge and other vegetation, and the surface made as level as possible. The sanding is of course the last thing to be done before planting. These are in brief the New Jersey essentials. Mr. Orrin C. Cook, of South Milford, Mass., who last year sent us the largest and finest berries we ever saw, has quite different notions. He says: "In selecting land for the cranberry, wet swamp land is the best, as it requires more moisture than is found on high lands, but any land that will grow potatoes will raise good cranberries. I raise my best berries on a hard clay soil. To prepare the ground for the plants, take out all the roots, brush, and tufts of coarse grass, plow deep, and, if not too wet, harrow. Having made the land as level as possible, set the plants one foot apart each way. We set the plants in the fall, from the middle of September until the ground freezes, and in the Spring until the 25th of May. We neither plow nor hoe among the plants, but in the fall go through and pull all the brush and grass that may have started. In three years the vines will cover the ground, at which time a full crop may be expected. There is no crop that we can raise here with so little trouble as the cranberry; after they get to bearing there is no trouble beyond picking the crop and marketing it. One acre will yield from fifty to one hundred bushels, and these sell from \$7 to \$10 per barrel of three bushels each."

We have heretofore expressed our disbelief in the success of the upland culture of the cranberry, but last autumn a gentleman from Long Island, whose address we have mislaid, brought us very fine specimens of berries, raised on upland. We should be glad if Mr. Cook's statement that "any land that will grow potatoes will raise good cranberries" were generally applicable. Some unfortunate attempts of this kind that we have seen, have made us cautious in advising any one to invest in cranberries on high ground, and we should be glad of more reports, whether of success or failure.

Mr. Gilbert Conant, whose report was quoted in the March *Agriculturist*, says, that in the article we copied, the word "plowed" in the third line of the quotation should be *flowed*.

The question is often asked, will it do to set wild plants, or must the cultivated ones be purchased. The cranberry, like all other fruits, varies from the seed, and seedlings will differ in the size and shape of the fruit, and in the productiveness of the vines. Wild plants may give good results and may not. The advantage of cultivated vines is that they are produced from runners of a sort known to be fruitful. Several different kinds are sold by dealers.

THE ROUGH DEUTZIA—(*Deutzia scabra*.)

Some Beautiful White-Flowering Shrubs.

While shrubs with gaily colored flowers excite our admiration, we believe that we derive more satisfaction from those the flowers of which are white. A Japan Quince, in a blaze of scarlet, or a Forsythia hung with its golden bells, is pleasant to look upon, but there is a tenderness and purity about a *Deutzia* or Silver-bell that call forth another sentiment than admiration. Pure white and green form a combination, whether in plant or bouquet, that is always pleasing. Among the white-flowering shrubs, are the old Snow-ball, now but little grown, and its more dwarf, but more beautiful Japanese brother, *Viburnum plicatum*. Then we have the Fringe-tree, the two Silver-bells, any number of varieties of *Spiraea*, and *Philadelphus*, or *Syringa* as it is often called. Besides these are the Double-flowering Plum and Cherry, that come early, and our native and beautiful *Clethra* that flowers late, and if it were not in every swamp, would be in every garden; our fragrant White Azalea, and a host of others that we cannot now enumerate. Among the white flowering shrubs, well enough known to be in all good collections, but yet not sufficiently popularized to be grown every where, as are Lilacs and Snowballs, are the *Deutzias*. These shrubs have no common name, aside from their botanical one, which is fortunately one readily popularized. The species most common in cultivation are *Deutzia scabra*, *D. crenata* and *D. gracilis*, all natives of Japan. The first two grow six or eight feet high, and differ only in the shape of the leaves and some minute characters of the flowers. They are so much alike that one is frequently sold for the other. The leaves are rough, and when examined by a strong magnifier, this roughness is found to be due to transparent star-shaped hairs, which are very pretty microscopic objects.

Deutzia gracilis, grows about two feet high and

forms a large tuft of slender arching branches, and when these are loaded with pure white flowers, nothing can be more graceful. This is a most valuable shrub for cemetery decoration, and is valuable for forcing. The florists around New-York force it in large quantities, and at this time (March) we find it freely used in bouquets and flower baskets. All these species are hardy as far north as Boston. The *Deutzias* are nearly related to the *Syringas*, (*Philadelphus*), but have smaller flowers, of a more delicate texture, and the plants are more graceful in habit. We give an engraving of a flowering branch of *D. scabra*, much reduced in size. The swamps of Virginia and southward furnish another white-flowered shrub that should be better known, the American Storax, *Styrax Americana*. It belongs to the same family with the popular Silver-bell (*Halesia*), has good foliage, and is in May covered with neat flowers that look much like small orange blossoms. The specimen from which our engraving is taken was from a large shrub in the grounds of that pioneer in horticulture, the late Thomas Hogg. The advancing tide of "improvement" has gradually encroached upon

these grounds, and this season will probably obliterate a spot dear to all horticulturists. We shall hereafter, when this collection is scattered, hardly know where to find many old favorites.

Thinning Out Ornamental Trees.

This is one of the matters most likely to be overlooked, and yet most necessary to be done this spring. It has already been neglected several years, on account of the reluctance very naturally felt to destroy a work that nature has been twenty years in building up. As a rule, the shade trees on our streets and avenues are planted too near each other. The tree that wants fifty feet of space for its full development is scarcely allowed twenty. This would be of little consequence, if the planter only had the nerve to remove them when they began to worry and devour each other. But he prizes his own handiwork; he is a tender hearted man, and perhaps lacking in taste. How can he be expected to destroy in a day what he has been so many years nursing and watching with pride. He can cut out dead limbs, and occasionally a live one if a straggler. But to put the grub ax to the root is more than he can bear.

Yet this is just the severe remedy that is needed among the beautiful plantations of shade trees in our suburban towns and villages. The trees stand too thick, and are destroying one another. The fight is as real as that of the Kilkeny cats, though less noisy. The top branches already interlock, and begin to die for want of light and air. The roots are meeting beneath the surface, and struggling for aliment. Neither of the adjacent trees has aliment enough nor room enough to develop after its own law of growth. It can not do justice to itself, nor show forth the beauty and glory of its kind. Every dead branch and distorted limb cries out

AMERICAN STORAX—(*Styrax Americana*.)

"make room," and room can only be had by the destruction of its neighbor. This must be had or the tree is spoiled of its beauty. Make this, and the gaps will soon be filled with more comely and healthful trees. One handsome, well developed elm or maple is worth a whole row of decaying, distorted trees, struggling for the mastery. This is not the less important with evergreens than with deciduous trees. The perfection of an evergreen consists in its being a perfect pyramid, with its base resting on the ground, and care should be taken that they are never so crowded by close planting that they lose their lower branches.

Trouble with Seed.

We expect to have every seedman of our acquaintance denounced as an imposter—that has been the way heretofore, and will probably be the case this year. Disappointment and vexation may be avoided by a little thought. Those who have had no experience in gardening, whether with flowers or vegetables, are generally in too much of a hurry. They sow their seeds—of all kinds, the first fine day, a cold rain comes and soaks the ground for several days, the seeds decay, and the seedsman is blamed. This is one way in which seeds fail. Another is, the directions to sow shallow are followed, the seeds start and a dry time comes on, and the germinating plants perish for want of sufficient moisture, when a watering at the proper time would have saved them. The smaller the seeds the more care they require, and it is much better to sow very small ones, such as *Lobelia*, in boxes with a pane of glass over them to prevent evaporation, than to risk them in the open border. It is well also to sow only a portion at one time; if the first sown escapes accidents, the other portion may be sown to give a supply of plants for a later bloom.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Work-Baskets and Bags.

PRIZE ESSAY BY MISS EVA M. COLLINS, ROCHESTER, N. Y.

Every lady, whether a woman or little girl, should have a convenient receptacle for the implements which are necessary for her use in sewing. A household work-box, basket, or bag, is a household nuisance. Each person should have her own thimble, wax, thread, needles, scissors, etc., and a place to keep them; and the manner in which she keeps the latter is a pretty sure index to her habits of neatness and order in other respects. So great a variety in the style of these articles lies within reach of each of us, that our individuality can in no way be better discerned than in the choice we make. Our minister tells us that copy-

Fig. 1.—GRANDMOTHER'S BAG.

ing is a suicidal act, and that the spirit of the aphorism is applicable to the commonest incidents of daily life. Why not, then, to our selection of an article which presents so great a variety of forms?—not that he can mean, in this case, that we should each have a work-box unlike those we see about us, in order to express our individuality, for it would be but another form of the same act, and equally suicidal in its nature; rather that each should sufficiently understand her own needs and preferences, as to have a choice even in so small an item as this. Grandmother thinks there is nothing quite so convenient as her work-bag, fig. 1, the magical properties of which are universally acknowledged; though none of us would think of constructing such another with a hope of its wonderful properties being inherent in bags of that description, as everything that belongs to Grandmother partakes of the same nature. It consists of a round piece of box-board, covered, and surrounded with pockets. Turned wrong side out,

Fig. 3.—BAG OPEN.

each should sufficiently understand her own needs and preferences, as to have a choice even in so small an item as this. Grandmother thinks there is nothing quite so convenient as her work-bag, fig. 1, the magical properties of which are universally acknowledged; though none of us would think of constructing such another with a hope of its wonderful properties being inherent in bags of that description, as everything that belongs to Grandmother partakes of the same nature. It consists of a round piece of box-board, covered, and surrounded with pockets. Turned wrong side out,

Fig. 4.—BAG STRINGS.

Fig. 5.—WORK BASKET.

(fig. 2.) and emptied of its contents, it is easy to see how it is made. The pockets, fig. 3, are eight in number. These, and the inside of the bottom board

are of gray merino. The upper edge of the pocket is scalloped with dark blue saddler's silk, which is the outside color. A rubber cord holds the gray pockets so tightly drawn up that the bag stands of its own accord, when the strings, figure 4, which are run in the outside from opposite directions, are loosened.

Mother's work-basket is made on the same principle. It is a basket lined with pockets, fig. 5, instead of a bag. The inside is made separately, and afterwards fastened firmly to the basket at the bottom of the pockets.

The top could be simply made fast with coarse thread to the basket, though that would not look so neatly finished as it would wound with ribbon over the top of the basket, and through the material of the lining, with bows tied over between the pockets, where the strain upon the lining is greatest, in the way mother's basket is finished off. The pockets, fig. 6, are made in a straight piece, just long enough to fit the top of the basket. The bottom of the row of pockets, fig. 7, is slightly gathered to fit a circle of the same material which fits the bottom of the basket.

Katie has a standing work-basket of willow, with three compartments. She has various nice little contrivances to hold her work, among which are "crabs." A crab like this is composed of three pieces of stiff pasteboard of an oval shape, two inches in width by three in length, neatly covered with silk, and sewed together at two

Fig. 8.—NEEDLE-BOOK, OPEN.

of the edges. By a slight pressure at the ends it opens, and reveals a cozy little room large enough for small work, and convenient to carry in a dress pocket. In this crab, which is brown on the outside and blue within, I see Katie has a bunch of tape trimming, and a spool of thread, No. 50. In another gray and pink one there is some ruffling, narrow lace, and 100 thread;

while stowed away in the drab crab I discover her tating shuttle, fig. 8. It is one Grandfather made from the centers of two old fine-tooth combs, placing a couple of strips of ivory between the outside pieces, and riveting the whole firmly together. Katie says it is entirely owing to her supply of crabs that she always has a variety of light work ready for any emergency. Her needle-book, figure 9, although large, is appropriate to her basket, which is large and roomy. It is of bronze morocco, bound and lined with blue, with leaves for needles at one end, and a place for the thimble in the side of the broad flat cushion at the other end of the case, fig. 10. There is a mo-

rocco pocket between the silk pocket and cushion. My needle-case, fig. 11, is smaller, and is therefore better suited to my work-box, fig. 12, where every inch of space is precious, and accordingly economized. It rolls up into quite a small compass, and lies under the tray, or sometimes in the tray,

Fig. 6.—POCKETS.

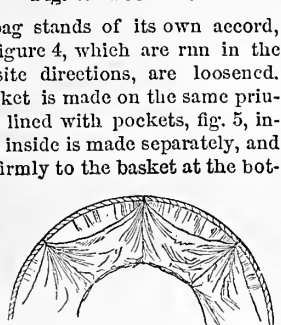

Fig. 7.—BOTTOM OF POCKETS.

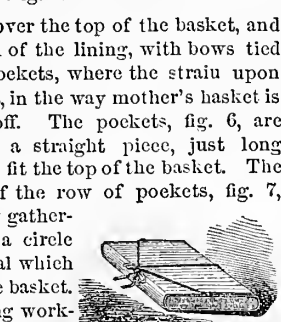

Fig. 9.

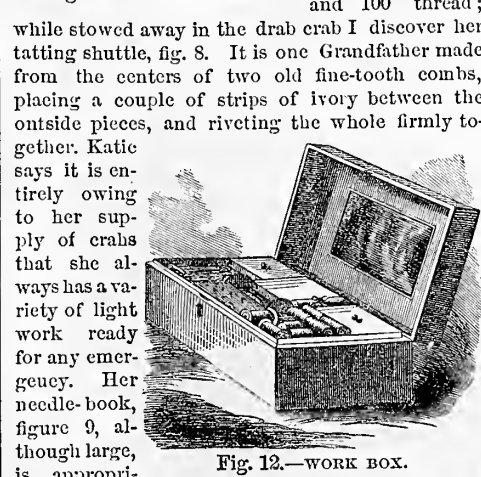

Fig. 12.—WORK BOX.

rocco pocket between the silk pocket and cushion. My needle-case, fig. 11, is smaller, and is therefore better suited to my work-box, fig. 12, where every inch of space is precious, and accordingly economized. It rolls up into quite a small compass, and lies under the tray, or sometimes in the tray,

beside my button-box. Between these and the cushion, is a narrow depressed division for knife, pencil, stiletto, buttons, tape, needle-book, etc. The scissors, tape-measure, emery, thimble, shuttle and pin-case belong in the division opposite the thread; while under the tray is a ball of wetting cord, box of hooks and eyes, case of skeins of silk, fig. 13, scissors' sharpener, sticks and roll of tape, papers of floss and French cotton, Afghan needles, a crab or two, and a dozen little bundles of work in various stages of development, besides a thousand and one other articles, which do not legitimately belong to the box, yet are most conveniently kept here.

Jennie's work-box, fig. 14, which is a tidy little affair, is a hexagon of stiff pasteboard covered with silk—gray on the outside, and scarlet within. On three of the side pieces are fastened pockets of the same material with which the basket is lined. On one side a covered strip of thin pasteboard, fig. 15, is fastened for a thimble case, over which hangs an emery, fig. 16, made from two round pieces of strong linen, stuffed with emery and wool, and covered with scarlet silk. The toma-

to shape is produced by drawing a double thread of green silk six times through the center of the emery—each time passing over the surface at an angle of sixty degrees from the last thread. A tuft of green is fastened with the string to the center of one side of the emery to increase its resemblance to a tomato. Jennie made several such boxes for her little friends a few months ago, some of which were very delicate in color—light blue and salmon—sea green and gray—and were prettier than her's, though scarcely as well adapted as her's for daily use.

Leaves from My Journal.—No. IV.

PRIZE ESSAY BY MRS. B. McLELLAN, OF OHIO.

May.—Lizzie and I have some pleasant chats together. I made her laugh to-day while telling her about putting up and taking down stoves in these premises. That is a job I absolutely dread. I believe I am very apt to lose my temper. Such fitting of pipes, lugging up stairs and down, into bedroom and parlor, scattering the grimy contents, and bedaubing every door and passage-way, one calling here and another in exactly the opposite direction, all doors open and all faces awry, to say nothing of seeing every one lift enough to break his back in two, I long ago placed it in my calendar as a day of all the year the worst. "Well, well, Mrs. Frisby," said a poor woman who was helping me at such a time, and to whom I was expressing my mind pretty freely, "I tell you it is harder where there are no stoves, and nothing to put in them either!" Was not this a reproof for my impatient spirit! Formerly the pipes of both sitting-room and parlor stoves were carried to the chambers above, and after making sundry circumlocutions, and turning various sharp corners, found their way into the roaring chimney. What times

Fig. 13.—THREAD CASE.

Fig. 14.—WORK BOX.

Fig. 15.

Fig. 16.

We had then! I made such a "fuss" that a mason appeared, who, by making a jog in the parlor, built up a little chimney to receive at once the abbreviated pipes. I imagine that *some one else* was quite as disgusted as I with the former process. That might have helped to make my stirring words more weighty, and to bring about so happy a result. Now and then when, on a freezing day, I go up to the chambers and see the cold black stoves standing like grim sentinels to keep all comfort at bay, I almost think the softened air of the twisting pipes would be a luxury, but I am not the one to say so. No, no; not I! by no manner of means.

When through with stoves, we had a talk about house cleaning. Lizzie appealed to my experience here. Docile and diligent pupil as she is, I am proud in any respect to be her teacher. She little knows in how many sweet and gentle ways she is mine. But I discoursed something in this wise. Some of my neighbors are through with house cleaning. But health is too precious to be risked in empty rooms, with open windows, until the weather is mild enough to do so without chill. It is not a pleasant "job," but with a little painstaking, and a hearty effort to keep good natured, it need only produce a healthful breeze in the atmosphere at home. I think we housekeepers are too apt to assume that the male portion of the household are now only incumbrances, to be treated with cold dinners and got out of the way with all possible dispatch. By far the easier way to accomplish house cleaning is to take one or two rooms at a time, and "get them to rights" before disturbing others. But if, perchance, the good man of the house, truly reading the signs of the times, in the kindness of his heart should bring to the rescue a couple of stout Irishmen, to take down stoves, and shake carpets, then all hands to the work, in double quick time. He must be allowed to fret a little at the general discomfort, and the impossibility of finding any thing he wants. But use some "policy" here. Show him the heap of dust taken from under the sitting-room carpet, and the moths that have made their nest under another in a dark corner of the bedroom, and ask him if it will not be healthier and better for the children to have this all removed before the warm days of summer are here. To your great delight he will very likely propose a fresh coat of paint for a room looking rather the worse for wear, or bring home a wall paper embellished with a dainty vine of violets and rosebuds, while just in his rear you will catch the glimpse of a man armed with brushes and pails, who receives some very decided orders to give the whole house a thorough going over, with some white preparation in the aforesaid pails. Don't forget just here to thank him for his thoughtfulness, while you say it is exactly what you wanted to have done, and take some pains to have a warm dinner ready, which, though spread in the kitchen, shall be eaten with good relish, and enlivened with cheerful conversation, into which the subject of the work on hand had better not be introduced. It would not be strange if, just "to be even" with you, he should then suggest, (as this is by no means the labor of a day,) that to-morrow you give him a cold lunch for dinner, and never mind about him, if you only won't get sick, before this hubbub is over.

We spent part of to-day in the woods, and came home with Georgy's hat wreathed with flowers, though his chubby hands made some displacement of their artistic arrangement. Lizzie is so busy preparing for a visit to her old home she hardly allows herself time for recreation. It may be well to tell her that sad story of my past history.

A Coffee Roaster.

A. in Fig. 1, is a cylinder of sheet iron, (Russia is the best) 8 or 9 inches in diameter, and 6 inches deep, wired at each end. About an inch from the lower end there is securely fastened a bottom of wire-cloth, about 7x7 mesh, or such as is used for market wheat screens in fan-mills. The wire bottom is represented by the dotted line B. Just be-

neath the wire bottom there is a cross piece C, riveted to support the wire and make a bearing for the end of the rod F, to which is attached the stirrer J. The upper end of the rod F, is supported by a cross piece similar to C, but which is fastened by lugs rivetted to the sides, that it may be removable.

Fig. 1.—COFFEE ROASTER.

The cover D, is of tin, to reflect the heat, and is divided in the center, one part overlapping the other, in order that one part of the cover may be lifted off easily to observe the process of roasting.

Figure 2 shows the under side of the apparatus. In roasting, the apparatus is placed on top of the stove, over a pretty hot fire, leaving half the cover

Fig. 2.—BOTTOM OF ROASTER. about the time the coffee begins to change color. Coffee can be browned in this way in from ten to twelve minutes and as evenly done as in the best of roasters. Since we used it we have not had burnt coffee in the house.

Independence of Servants.

We have received an essay of thirteen pages in a beautiful hand writing, and happily expressed, containing the fair writer's experience with servants. Her afflictions and inflictions from this source are so much matters of course in housekeeping that we should not add much to the knowledge of our readers by publishing them. Paul's description of his perils by sea and land is not more graphic than the experience of many of our housekeepers in this line. They are not limited to "three shipwrecks" or to "a night and a day in the deep." Wrecks of stoves, chairs, tables, crockery, and hardware lie all along their household voyaging, thicker than stranded ships on Hatteras or Absecom, and the better part of their time they are not only in the deep, but in "hot water." There are good servants no doubt, models of neatness, faithfulness, patience, skill and industry, but they are about as scarce as Solomon's virtuous woman. Who can find them? They are advertised, we know, of every nationality, and every variety of capacity, but housekeepers suspect, after a few trials, that the keepers of Intelligence offices use a more than poetic license. A normal school for the training of servants is one of the great wants of the age. We shall get along to that some time in the millennium probably, but in the meantime what are we to do? Some are ready to declare their independence, and where that is feasible we like the plan.

A Southern lady of true grit writes us: "I am so much interested in the Essays on Housekeeping that I almost envy Mrs. Lyman her conveniences. We Southern ladies know nothing of such things, and if we buy any of the labor-saving machines they are almost useless to us. I bought a stove and paid \$35 for it, and in three years it was burned

up, and since then I have gone back to the fireplace. Our servants never take care of any thing, and it is fret and worry all the time with them. I have resolved to learn all I can from the *Agriculturist* about the labor-saving machines, and I think a few more of those admirable essays will put me on the right track, and you will have occasion to hear of my experience, for I am resolved to do my work myself, rather than wear out my patience and temper with servants, [who neglect and waste every thing committed to their care." This lady's experience is probably confined to servants, trained under the old *regimé*. The training of free labor is a long step upward, and that stove would have lasted in any northern home at least a dozen years, and by that time there would have been a new pattern of stove, so much improved that we could afford to sell the old one for old iron. But with the average grade of service that we get under free labor, there are a multitude of families where the housekeeper would do quite as well without servants as with them, if she could have suitable conveniences like our prize essay kitchen and its appurtenances. It is far within bounds to say that a kitchen may be so arranged as to save one half the necessary work of cooking and washing. It is much cheaper in the end, to bring water into the house by pipes where you want to use it, and to carry it off in the same way, than to furnish muscle to bring and empty every pailful as it is needed. Pumps, lead pipe, tanks and reservoirs are much cheaper than labor. Then there is a great saving in a cook stove or range with its assortment of cooking utensils. Another saving is in a good washing machine and wringer, and another still in the new patent dish washer. Fitted out with these appliances, a woman in good health and without small children, can often do her own work with less worry without a servant than with one.

But, then, she must not have too high a standard of housekeeping, or too many claims of society upon her. The meals must necessarily be served in the kitchen, and she must spend the most of her time there. There can not be much time left for company, or for reading, or for the accomplishments of life. It can not be denied that servants are a necessary accompaniment of the most desirable style of living. A woman of cultivation and refinement can not do justice to her children, to her social position, and to her own self-culture and at the same time drudge in the kitchen. Servants are a necessity, if one has the means of supporting them. Our essayists offer many valuable hints upon their training and treatment.

Graham Pudding.—Mrs. "N. E. B."—Stir Graham flour gradually into boiling water with a little salt, and make about as thick as hasty pudding, or mush, and free from lumps. Eat with tolerably rich milk and sugar, and with the addition of canned peaches or other preserved fruits. If there be any of the pudding left over it may be cut in slices and fried in lard or dripping, and is very good. We have been having the above pudding for breakfast daily for years, and our "boys" are not willing to do without it. It is good for the teeth.

Rhubarb Pudding.—One cup sour milk, one teaspoonful soda, make a stiff batter with flour, and add some cropped stalks of pie plant. Boil in cloths and serve with cream and sugar for dinner.

Corn Starch Pudding.—One quart boiling milk, three spoonfuls corn starch, mixed with a little cold milk, sweeten and flavor with lemon if liked. Pour it into the boiling milk, stir well for two or three minutes. Pour into moulds. When cool, turn out and surround with large ripe strawberries to be eaten with cream and sugar. The above always presents a beautiful appearance.

Potato Yeast.—Boil one pint of hops in two quarts of water, strain the water from the hops, grate five good sized potatoes, put in a kettle, add one cup of sugar, one tablespoonful of salt, one of ginger, boil ten minutes, add more water if too thick. Strain through a colander, cool, add yeast to rise, bottle. It will keep a number of weeks.

BOYS & GIRLS' COLUMNS.

Boy Training.

"There! it may lay there, for what I care, and a plague on all grammars, I say!"

These words burst out with something of the same force which dashed a well-thumbed book across the room. Hal believed that his uncomfortable feelings were owing entirely to a "plaguey hard lesson" for to-morrow, but it is possible that circumstances may have aggravated the hardship; as for instance, a bright sun, smooth, hard snow, and other signs of a first-rate skating time. After looking out of the window a moment, Hal again broke forth with all the indignation of twelve years: "It's a real dog's life to be a boy!—school, school—work, work, from one day's end to another. Stupid books!—and what's the good of it all, I'd like to know!"—"What is the good, sure enough?" said a voice behind him.—Hal had forgotten the quiet reader by the fire. He colored a little, but answered: "I'm sure I can't see, Cousin Ralph. Reading and writing are well enough, or learning a trade, and all that; but to be studying so much stuff, and shut up all the pleasantest days of one's life—I tell you what, I'd rather be a savage at once. What a jolly time! Free all day, in the real wild woods, hunting and fishing—why, what is their work, we call play."

"Stop a moment, Hal. We are speaking of boys—do you think savage boys have nothing to learn?"—

"Nothing like Latin grammar, I'll bet my head! It is only fun to learn to make arrows, to hunt and to fight—I would change work with them, any day."

"Be not so sure of that. Hear a specimen of boy training I have just been reading.—'All the boys over ten years are chosen to be companions of the son of the chief. They are taken to some lonely spot in the forest where huts are built for them. The old men go out daily to teach them their war dances and their notions of law and government. Much beating is necessary to bring them up to the required perfection, so that when they return from the forest their backs have many scars. When the boys have reached the age of fourteen, the great ceremony of their lives takes place. They all stand naked, in an open space, each with a pair of sandals as a shield on his hands. Facing the boys stand the men of the tribe armed with long wands of tough wood. They put such questions to the boys as 'Will you guard the chief well? Will you guard the cattle well?' and while the boys answer 'Yes,' rush at them, each aiming a blow at the back of a boy, causing the blood to squirt out of a wound often eighteen inches long. Thus the boys' backs are seamed with wounds, the scars of which remain through life. This is their initiation into manhood.'"

"Horrible!" said Hal, with a sigh, "why that is snuffing for worse than nothing."

"Yes, and you may be sure that the demands of ignorance and superstition are harder than any which civilization imposes upon us."

Hal thought a moment, still unwilling to admit the expediency of school education, and then he said, "But any way, I wish I had lived in old times—the real, grand old times, you know, when there were knights and tournaments, and men did such brave deeds. There were no school books then, and a man might be brave and true and make a great name for himself without even learning how to read. Riding, and fighting and punishing all bad people. Oh! I could be happy while I was a boy with only thinking of such a life. And those men were not savages—they lived in castles, and were Christians—they had to say ever so many prayers, and do each man his best for God and his lady—Oh, Ralph! was it not easier and pleasanter to become a great man then, than to study up to it as we have to do now?"—"As to the desirableness of that life, Hal, we will not argue just now, we will keep to the boys and see what their work was." And Cousin Ralph, taking a book from the shelf, read as follows: "Young Roland passed his earliest years with his mother and her attendants, who taught him the pater noster, and Ave Marias, besides the first ideas of that devotion to women which belonged to the age of chivalry. But at the age of seven years his education began in earnest, as was usual then. Though the father might be capable of conducting the education of his son, it was always intrusted

to some other knight, lest the tenderness of the parents should spare any of the trials and hardships necessary to the after career. So the little Roland, at that early age, left the indulgences of his own home to shift for himself in a strange household. The first place he was to fill was that of page to his new lord, his duty being to accompany the knight on excursions, do his errands, serve him at the table and pour out his drink, though the boy was of as noble blood as the man he served. At the same time great care was taken in the training of the boy. Every moment not devoted to the service of his lord was given to the practice of severe gymnastics or horsemanship; while the custom of waiting upon visitors, and listening to their conversation helped to give the grace of manner so necessary to a knight of renown. Meanwhile the young page had to encounter the jeers of his companions at his awkwardness, and bear with sore and aching limbs from his violent exercise, besides the carefully concealed pain of home-sickness. Seven years of this hard service brought Roland to his fourteenth year, the eagerly expected time when he was to exchange the short dagger of the page for the sword of the 'squire.' This was a religious ceremony and conducted with due solemnity. His exercises now became more severe still, such as springing upon horseback armed, turning somersets in heavy armor, besides careful instruction in managing his horse and arms. As squire he continued to follow his lord to battle; held his stirrup, lance, shield, or gauntlets; cleaned his armor, and took care of his horse. In battle the squire waited at a distance ready to furnish a fresh horse or to draw his master from the field if wounded. If a noble squire had done well during his service, the honor of knight-hood was conferred at the age of twenty-one. Roland prepared for this great occasion by long fasts with numerous prayers and masses."

Hal had flinched at the idea of giving up the indulgences of home almost before the end of baby-hood, fidgeted at services altogether menial in his eyes, and finally wound up with a prolonged "whe—e—w!"—"There, Hal, I think you will never have to bear harder training than that, and, whatever of good or of romantic interest, it is well to keep from the 'old times,' you may be sure that true faith, in an 'excellent' ever before us, is the best aid to insure a manhood worth having."

"Baby Ned" one day saw his father punish his older brother; his tender little heart was much grieved. His mother explained to him that Wally was naughty, and Papa "slapped" him to make him good. The next day he came into the dairy as she was "patting butter" with the ladle. "Lap but, (slap butter) mama?" asked Ned. "Yes," said his mother. "Is not but?" (naughty butter,) asked the little fellow earnestly. II.

The Fate of "Greedy Dick."

All the boys and girls who are careful to keep clean hands and faces, hair combed, clothes brushed, and all things about them as neat as their work will allow, and who love to share their good things with their companions, can afford to laugh at the unhappy fate of poor

New Puzzles to be Answered.

No. 261. *Arithmetical Problem*.—Five hundred dollars at interest at ten per cent. per annum, is to be paid up in five equal, annual payments. Required the amount of each payment.

No. 262. *Word Square*.—With the following letters, R, R, S, S, P, L, A, A, A, A, E, E, E, E, I, I, form a word square, that is, a square arranged so that the words will be the same, whether read across or downward.

No. 263. *Illustrated Rebus*.—Very good advice.

No. 264. *Geographical Enigma*.—By Myron A. Eddy.

I am composed of 28 letters. My 1, 7, 13, 23, 15, 19, 22, 27, is a lake in Nevada. My 3, 10, 21, 12, 25, is a lake in Russia. My 4, 16, 24, 17, 2, 21, is a lake in Canada. My 6, 11, 14, 15, 26, 27, 12, is a lake in China. My 7, 15, 4, 28, 12, 11, is a lake in New York. My 8, 11, 24, 3, is a lake in Lombardy and Venice. My 9, 22, 4, 4, 26, 1, 5, 21, is a lake in Florida. My 14, 12, 25, 24, 16, is a lake in Ethiopia. My 15, 13, 18, 28, is a lake in California. My 18, 21, 11, 14, is a lake in Nicaragua. My 20, 25, 12, 16, 14, 2, is a lake in Wisconsin. My 24, 19, 4, 9, is a lake in Ireland. My whole is the name and location of a lake in the U. S.

No. 265. *Arithmetical Problem*, to be solved mentally. If 6 cats catch 6 rats in 6 minutes, how long will it take 50 cats to catch 100 rats?

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the April number, page 147. No. 258. *Clock Problem*.—It will strike correctly at 11 o'clock; the number of strokes will

Greedy Dick. He didn't do any of these things, and our artist traces him at last to a barrel of lard. There we leave him, a warning to those who chance to need it!

be 71....No. 259. *Illustrated Rebus*.—Foul weather stops plain sailing....No. 260. *Mathematical Problem*.—Diameter of smaller circle, 334 feet; of larger circle, 392 feet.

The Doctor's Talks.

How do the young frogs, or rather tadpoles get on? They probably swim about lively enough by means of their long tails and act much more like little fish than they do like frogs. It is quite curious that frogs, which live partly on land and partly in the water, and toads which live upon land altogether, should be, in the early part of their lives, so much like fishes. They are like fishes not only because they live in the water, but in the manner of their breathing. Every boy and girl knows that land animals breathe with lungs, and that fishes do the same with their gills. Fishes do not need so much air as land animals do; they get all that they need from the water which is constantly passing over their gills. The tadpole is a long while in getting ready to breathe air. A great many curious changes go on in the arrangement of its heart and lungs and all that, which we will not undertake to explain just now. Being fish-like in its

Fig. 1.

manner of living, the tadpole breathes by an arrangement like gills. When examined quite young, the gills are seen on the outside of the head; curiously fringed attachments floating in the water, but they do not last a great while in this condition, as arrangements are soon made to inclose the gills and have them do their work out of sight. The small spot on the head of figure 1 shows where the gills are placed. The tadpole swims around by means of its tail, its mouth improving as it grows, and getting into a condition to allow the animal to feed on the vegetable matter that it finds in the water. After a while, a most curious change takes place, two hinder legs appear, (fig. 2,) showing that the animal, though it has its birth in the water, is destined to live upon land. Later still, the fore-legs may be seen under the skin, and they finally break through. When the tadpole is ready to leave the water it has no further need of a tail; this is not jerked off as is generally supposed, but gradually disappears, its substance being taken up—absorbed as we

Fig. 2.

say—by the other parts of the body. All this while that the animal has been providing itself with legs, to enable it to live on land, its interior arrangements have undergone a change no less wonderful, lungs have grown to take the place of gills, and its very simple spiral intestine has become a stomach, etc. The time required for the tadpole to complete all these changes varies in the different kinds, and it is governed also by the amount of light and heat the young animals enjoy. Sooner or later the young frog or toad, as the case may be, gives up his fish-like ways and takes to the land, where he breathes air and no longer lives on plants, but takes to animal food in the form of insects, etc. The toad never returns to the water, but the frog does not abandon his youthful ways so readily, but is in water or on land as best pleases him.

To See Three Thumbs.—Look steadily, for a short time at a white wall, and then place the tips of the thumbs together and closing the fingers over the palms, raise the hands up in front of the face and about a foot from it. If you look steadily at the wall, and not at the hands, a small thumb will be seen between the other two. The engraving shows the appearance as well as the position of the hands.

A Childish Conceit.—One night in a thunder shower we thought the little ones were all asleep, when a little voice from the "trundle-bed" called out, "Oh, mother, the dark is winking! first it shuts up, and then it shuts down." II.

Please Don't waste time, paper, and postage stamps, by writing out and sending to the *Agriculturist* old puzzles, such as "I understand, you undertake, to overthrow my undertaking." That rebus amused us thirty years ago, and has been a household favorite throughout the country ever since. It has been sent here for publication from one place or another about twice a week, for several years! Many other equally ancient friends pay us similar visits, and are politely received in our (waste) basket. Good, new problems are always acceptable, though not always published at once.

COPYRIGHT SECURED.

A LIFE-LIKE PORTRAIT. — Engraved for the American Agriculturist.

This little fellow in the picture, no doubt, finds it much easier to play off a joke upon his grandmother than to be an artist in colors. He has stationed his sister behind a picture frame, and called the old lady to admire the fine portrait. It is a harmless, funny deception, for grandmother's spectacles will soon enable her to see through the frame and the joke at the same time, and she will join the hearty laugh the children are ready to give when the right time comes. As long as love of fun does not lead to making others feel unpleasant, for the sake of sport, it is not blame-worthy, if indulged in at proper times. If carried beyond that point, it may become a serious wrong. By such means friends have become enemies for life. Especially should care be taken not to wound the feelings of the aged. A child who makes sport of the infirmities of old people, should remember that he may one day be in the same condition, and also that the burdens of age are hard enough to bear, without the addition of unkindness from those who should show respect. To needlessly add sorrow to grey hairs has always been counted one of the most inexcusable crimes.

"Handsome Is that Handsome Does."

A short time ago I was visiting at the house of a friend; the oldest son, who has given an arm to his country, was looking over a box of old letters, etc., when his little sister, who was standing by him, took up a photograph with the exclamation. "Oh, what a homely woman!" "That!"

said Edward, with a look of hurt surprise, "that is the handsomest woman I ever saw! You will not think her homely Mrs. S.," he said as he passed the picture to me. It was the face of a woman apparently about forty-five or fifty years old, a thin and slightly wrinkled face, with a good deal of kindness, but no beauty in it. I told him what I thought of it, but I was sorry for my frankness, when I saw that there were tears in his eyes, as he laid the picture carefully away, saying: "She took care of me when I was in the Hospital, at the time that I lost my arm, and she looked beautiful to me I can tell you." "Yes," he added earnestly, "I would give more to see her now than I would to see any other woman I ever saw, young or old." Our ideas of beauty are greatly influenced by the knowledge of the persons character. H.

More About the Geographical Problem.

(See March No., page 107.)—A correspondent at Easton, Md., writes: "Your Geographical Problem is a simple question in navigation, and I will answer it in as few words as possible. The point at which the day of the week changes is the anti-meridian of Greenwich. Ships' chronometers are set to Greenwich time, the navigator sailing, say to the westward, finds his time as shown by the sun, becoming daily slower than the chronometer until when he reaches 180° west longitude, there is just 12 hours' difference. By jumping a day at this point, he makes his time 12 hours fast, but the difference lessens as he sails westward. All circumnavigators make it a practice thus to change the day at this line."

**WHEELER & WILSON
ROTARY HOOK****SEWING MACHINES.
625 BROADWAY.**

"WOMAN'S GREATEST BOON.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a Sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six years' service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family."
[American Agriculturist, Jan. 1865.]

THE GREAT FAMILY SEWING MACHINE.**HIGHEST PREMIUM
Elastic Stitch
SEWING MACHINE.
495 Broadway, New York.**

Justly celebrated for perfect simplicity, great strength, and immense compressing power, is GUARANTEED, with eight men and two horses, to self-temper the clay and make 3,000 to 3,500 elegant bricks per hour. J. H. RENICK, Proprietor, No. 71 Broadway, New York, Room 28.

POMONA'S HOME NURSERY

AND SMALL FRUIT FARM, removed to Glendale P. O., Camden Co., New Jersey. We hope to offer a very large stock to fall trade, of extra quality, at prices which will insure large sales. During summer we expect to issue 10,000 of an edition of our "Manual of Grape Culture," for free distribution. J. H. FOSTER, Jr., White Horse Station, Camden and Atlantic Railroad, 12 miles east of Philadelphia.

**THE FIRST MORTGAGE
BONDS**

OF THE CENTRAL PACIFIC RAILROAD COMPANY
present unusual inducements to investors, among which are the following:

First—The rate of interest is six per cent. IN GOLD.
Second—The principal is payable IN GOLD at maturity.
Third—The cost, NINETY-FIVE PER CENT. and accrued interest, is TEN PER CENT. less than that of the cheapest six per cent. Gold-bearing Bonds of the Government.
Fourth—Owing to the liberal grants and loans by which the Government fosters this great national enterprise, its success is certain, and its financial stability is altogether independent of the contingencies which attend ordinary railroad enterprises. The SECURITY of its FIRST MORTGAGE BONDS is therefore AMPLE, and gives them a character for safety and reliability equalled only by that of the obligations of the Government itself. **Fifth**—The earnings of the completed portion of the road are already largely in excess of the interest obligations which the Company will incur on twice the distance, rendering the uninterrupted payment of the interest ABSOLUTELY CERTAIN.
Sixth—At the present rate of gold they pay nearly $\frac{8}{4}$ per cent. on the amount invested.

**AMERICAN
WALTHAM WATCHES.**

We claim and are prepared to prove that the American Watches manufactured at Waltham, Massachusetts, are not only equal, but far superior, to the watches of England, Switzerland and France. We also claim that they are CHEAPER, MORE ACCURATE, MORE DURABLE, and more easily kept in order and repaired than any other watches in the market.

Because in each one of the very numerous parts of which a watch is made up, we attain, by mechanical power, nearly absolute mathematical precision and uniformity, making every watch of any one style a true copy of its model.

This similarity in structure reduces the cost of production; it secures uniformity in results; it infallibly perpetuates any excellence that may be once achieved, and makes it easy to repair any injury sustained, or replace any part that may be lost or destroyed.

In addition to these mechanical advantages, our Watches are simpler in structure, and therefore stronger, and less likely to be injured than foreign watches.

How they run under the hardest trial watches can have, is shown by the following letter.

PENN. RAILROAD COMPANY.

OFFICE OF THE GENERAL SUPERINTENDENT,
ALTOONA, Pa., 15th Dec. 1866.

Gentlemen: The watches manufactured by you have been in use on this railroad for several years by our engineers, to whom we furnish watches as part of our equipment. There are now some three hundred of them carried on our line, and we consider them good and reliable time-keepers. Indeed, I have great satisfaction in saying your watches give us less trouble, and have worn and do wear much longer without repairs than any watches we have ever had in use on this road. As you are aware, we formerly trusted to those of English manufacture, of acknowledged good reputation, but as a class they never kept time as correctly, nor have they done as good service, as yours.

In these statements I am sustained by my predecessor, Mr. Lewis, whose experience extended over a series of years.

Respectfully,
EDWARD H. WILLIAMS,
General Superintendent.

American Watch Co., Waltham.

Any of the grades of Waltham Watches may be purchased of Watch Dealers generally throughout the country.

 ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per lb.
 GUNPOWDER (Green), \$1.25, best \$1.50.

COFFEE DEPARTMENT.

Our Coffee Department is very extensive—the largest, perhaps, in the country. We run three engines constantly, and sometimes four or five in roasting and grinding our Coffee. Our Coffee buyers are experts, who examine most of the Coffees imported, and select the best and finest flavors for our trade. We employ the most experienced and skillful roasters, who exercise the greatest care that it shall be cooked in a perfect manner. It is always fresh, for our orders crowd our facilities to their utmost capacity. A considerable portion of the Coffee put upon the market of late years is picked while the pods are green, and subjected to artificial heat to open the pods. This is not so good as that which ripens in the natural way upon the plant. Our Coffee buyer thoroughly understands this business, and can readily distinguish the naturally ripened from the artificially cured; and he only buys the Coffee which is naturally ripened. We examine the cargoes as soon as they arrive, and our trade is so large that it requires all the finest lots. This is what gives our Coffee a superior flavor to many others, and the same flavor it used to have in days long gone by. It is a common saying that most Coffee does not taste as well as it formerly did. The reason for it is, that a considerable portion of it is picked before it is fully ripe. We sell none but the fully ripe, rich flavored Coffee.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of

THE GREAT AMERICAN TEA COMPANY.

Nos. 31 and 33 VESEY-ST.
 No. 640 BROADWAY, corner of Bleecker-st.
 No. 461 EIGHTH-AVE, north corner of Thirty-fourth-st.
 No. 299 SPRING-ST.
 No. 205 FULTON-ST., BROOKLYN, corner of Concord-st.
 No. 133 GRAND-ST., WILLIAMSBURGH.

COUNTRY CLUBS, Hand and Wagou Pedlars, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled, and in case of Clubs can have each party's name marked on their package and directed by sending their orders to Nos. 31 and 33 Vesey-st.

Our friends are getting up Clubs in most towns throughout the country, and for which we feel very grateful. Some of our Clubs send orders weekly, and some not so often; while others keep a standing order to be supplied with a given quantity each week, or stated periods. And in all cases (where sufficient time has elapsed) Clubs have repeated their orders.

Parties sending Clubs or other orders for less than \$30 had better send Post-Office drafts, or money with their orders, to save the expense of collecting by express; but larger orders we will forward by express, to collect on delivery.

We return thanks to parties who have taken an interest in getting up Clubs; and when any of them come to New York we shall be happy to have them call upon us and make themselves known.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs of less than \$30.

N. B.—All villages and towns where a large number reside, by clubbing together, can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,
 Nos. 31 and 33 VESEY-ST.
 Post-Office Box, No. 5,643, New York City.

GETTING UP CLUBS.

Some parties inquire of us now they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

We publish some of our Club Lists to show how it is done and as a matter of reference.

After the first Club we send blanks.

Direct your orders plainly, THE GREAT AMERICAN TEA COMPANY, Nos. 31 and 33 Vesey-st., Post-Office Box, 5,643—as some parties imitate our name as near as they dare do.

From The Great American Tea Company's Advocate.

A Word with Our Customers.

We have no doubt that our customers, scattered throughout the length and breadth of the land, as they are, embracing every State in the Union, except those on the Pacific shores, will be interested to learn how we have succeeded in our great enterprise of furnishing Teas and Coffees, to all, at the smallest possible profits. To afford them this information we propose to give a few facts connected with our business.

Years ago, in the early stage of our enterprise, we based our calculations and graded our rates of profit upon the basis of a trade of \$100,000 per week. This amount we expected to reach by enterprise and fair dealing. We well knew that it could be accomplished only by filling every order promptly, and to the letter; and at uniform prices. These principles we have adhered to strictly, and have carried out the ONE PRICE SYSTEM in all our transactions.

After years of anxiety and incessant toil, we are enabled to say, without boasting, that our standard of sales, which we erected years ago, has been reached. The *New York Tribune*, in an editorial published in their paper several months ago, placed the amount of our sales at that time at \$90,000 per week. Our business increases regularly and constantly, and never faster than at the present time. We therefore look confidently forward to a large increase during the present year, over and above the average of \$100,000 per week. At the present time our sales are fully equal to 2,000 chests per week, which is equal to about one-fifth of all the Teas imported into this country. This we consider a great success for a specialty—probably the greatest ever achieved in this country, in any similar mercantile enterprise.

With our increased trade we increase our facilities, so that all our orders will be filled as promptly and correctly as heretofore, and perhaps more so, because our system becomes more and more perfect with time and practice.

We employ at least two hundred persons constantly, and by our perfect system of division of labor into departments, we make a great saving of expense, of which we give consumers the benefit, by furnishing them with the great necessities of life—TEAS AND COFFEES—at the unprecedented low figures which we publish in our Price List in another column.

While we feel sure that we have given, and as we shall continue to give, our customers the fullest and amplest return for their money, we thank them, one and all, for their patronage.

Complimentary Letters from Clubs.

Cedar Rapids, Iowa, March 12, 1867.

Great American Tea Co., 31 and 33 Vesey-st., N. Y.

Gentlemen: I have received my first box of Tea, \$14.25, and with pleasure inform you that it has given the purchasers a feeling of old times, as they have experienced in drinking Tea before the war, satisfying them the Company is not a "Humbug." I send to-day my second order, \$12.40. Please forward to me with bill for collection.

A. C. MESSENGER.

Woonsocket, R. I., Feb. 4, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: I now send you my 5th order for Teas, which I hope will be as good as heretofore; it is just one year since I sent my first order of \$20, which I think was the first order you got from here as a club. During the year I have sent you upwards of \$400, and I have not heard a complaint yet from any one, but all speaking well of your Teas, and are well satisfied. Accept my thanks for the complimentary package. Inclosed you will find \$134.35 for this order. Hoping you will forward as soon as possible, I remain,

Yours respectfully, JAMES WOODHOUSE,
 Direct the Teas for me, Woonsocket, R. I., by Earl's Express.

Geneva, N. Y., Feb. 14, 1867.

The Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gents: We have now been receiving Tea from you about one year, and find, in footling up our books, we have received of you Tea and Coffee, to the amount of \$794.25 for this small village and vicinity. The public have perfect confidence in your Tea and Coffee, and the misrepresentations against you which we had to contend with at first, are now

harmless. We congratulate you on the general success of your enterprise, hoping the hitherto pleasant relations which have existed, may continue between yourselves and

Yours respectfully,

LUM & SON.

Angola, N. Y., Feb. 16, 1866.

The Great American Tea Company.

Gents: Your Box sent me by Express has been received. Your bill was paid on delivery. I found no mistakes, and I am glad to inform you that the Tea is giving good satisfaction. I had to make some effort to raise the club I sent you, but as the ice is broken, and nobody drowned, you may expect soon to receive a much larger club order from this place.

Yours truly, JOHN M. SLATER.

Stoughton, Dane Co., Wis., Feb. 25th, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: The Tea I ordered came to hand all right, and gives general satisfaction. Please accept my thanks for the complimentary package.

Some of my neighbors that appeared to be afraid of being humbugged when I got up the club, are now forming a club, and you will probably hear from them soon. The ball is now started in this vicinity, and will probably turn the Tea trade in a new channel. I expect to send another club order before the Tea that we now have is all consumed.

Yours truly, E. E. ROBERTS.

Second National Bank of Detroit,

Detroit, Feb. 28th, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: I received in good order Box of Teas and Coffees from your House yesterday. They are quite satisfactory to all parties. For the complimentary package of Tea please accept my thanks. I shall send you in future with all future orders, a draft on the Mercantile National Bank, N. Y., and thus save for myself 75 cents for return of money. I hope to send you another order in ten days.

Yours truly, R. WATSON LEAGE.

Office of the Northwestern Record,

Sheboygan Falls, Wis., Feb. 28th, 1867.

Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gents: The last order I sent you for Teas was for my own responsibility, but I incurred no risk, as it all went off in a very short time to members of former clubs. There are three clubs now forming in this county. All who purchase once are sure to keep doing so, and the trade is increasing here. Another order from this place soon.

Yours truly, S. D. LITTLEFIELD,

Editor Record.

Treasury Department, Third Auditor's Office,

March 2, 1867.

Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: I have the pleasure of enclosing you our second order, \$139.13, which is more than double the first one, and the next one may increase proportionately if these give as much satisfaction as the first.

You will please forward as before, by The Adams Express Company, C. O. D.

Very respectfully,

Your obedient servant,

H. C. HILL.

CLUB ORDERS.

The Best are the Cheapest.

The MASON & HAMLIN CABINET ORGANS are acknowledged to be the best instruments of this class in the world. It is the policy of these makers to produce none but the very best work. They aim at success, not by using poor material and economizing in workmanship, so that their instruments can be sold at a little less price; but by producing the most durable, reliable, and in all respects the best work possible, and selling it at the very lowest rates at which such work can possibly be afforded, and at the same prices to all.

They now manufacture more than sixty different styles of Organs, varying in price from \$75 to \$1,000 each. These instruments contain all the latest improvements, some of which are not to be found in other instruments, the right to their exclusive use having been purchased by M. & H., in some cases at very large expense.

MASON & HAMLIN have been awarded several times as many highest premiums, at Industrial Fairs, as any other maker, having received fifty-six within a few years.

They present in their Circulars the printed testimony of a large majority of the most eminent Organists, Pianists, Singers and Composers in the country to the superiority of the instruments of their make.

It is certainly economy in purchasing an instrument of this class to get the best, although the first cost may be a little more, as a poor instrument will soon get out of order and become comparatively worthless.

It should be remembered that the recommendations of dealers are not always reliable, as there is great temptation for them to recommend those instruments on which they can make the largest profit; and makers of inferior work can afford the largest discounts. Mason & Hamlin have fixed their retail prices so low that they can afford only very small discounts, at wholesale, and hence the temptation to dealers to recommend and sell other instruments is great.

Circulars with full descriptions, illustrations, and prices of the different styles, with hints on what constitutes, and how to select a good instrument, sent free to any one desiring them. Address

MASON & HAMLIN,
596 Broadway, New York,
Or, 151 Tremont-st., Boston.

687 ACRES, 6 miles of Richmond, Va. The Wood and Timber on it will pay first cost. Sandy loam, every acre good for Garden or meadow. 1 1/2 miles of York River R. R. 100 acres cleared; no buildings. \$15 per acre, or will be divided. Address A. VAN DOREN, Falmouth, Stafford County, Virginia.

Spear's Preserving Solution

Will effectually prevent fermentation or decay, and preserve all kinds of Fruits, Vegetables, Jellies, Tomatoes, Cider, Milk, Syrups, &c., &c., in a perfectly fresh and wholesome condition, without sugar, and without hermetically sealing or air tighting; hence a saving of sugar—and from 50 to 75 per cent. in the cost of jars. The solution is warranted to contain nothing injurious to health. Fruits, preserved by this solution, are equal to any "canned" fruits, while the use of the solution admits of keeping the fruits, &c., in vessels of any size, and of using them at long intervals when opened. It saves sugar. It will preserve milk sweet from 13 to 36 hours longer than it will naturally keep—causing it to furnish more and better cream, and make more butter in warm weather. One bottle will preserve 123 pounds of fruits, or 48 gallons of cider, or 123 gallons of milk. Price, \$1. Full directions for using with each bottle. Sold by all merchants; ask for a circular with full particulars.

L. P. WORRAL, Gen. Agt., No. 91 Hudson-st., N. Y.

PURE BRED

WEBB SOUTHDOWN SHEEP FOR SALE.

The celebrated flock of the late James C. Taylor, of Holmdel, N. J., numbering 26 Rams, 66 Ewes, and 40 Lambs, is now offered for sale, either as a whole flock, or in lots to suit purchasers.

The well-known reputation of Mr. Taylor, and his flock, is so perfectly understood by the breeders of Southdowns in the United States, that it is not necessary to give any further description of them, excepting to say that they are his choice reservation, as he never sold his selected Ewes, although frequently tempted by very large offers.

The flock is in a fine healthy condition, and can remain where they are until summer, at the risk and expense of the purchaser, should it be so desired, as plenty of the best kind of food and capital arrangements for keeping them are provided. A descriptive Catalogue is being prepared, and will be forwarded by mail to any one by inclosing postage stamps. Address WM. J. C. TAYLOR,
Holmdel, N. J.

Full Blood and Grade Alderney and Ayrshire Stock for Sale.

DR. H. SCHROEDER, Bloomington, Illinois.

HUBBARD AND TURBAN.

My specimens of these two squashes received the two prizes offered for the best squash for family use, at the last exhibition at the rooms of the American Agriculturist. As this was open to competitors in all parts of the United States, the Hubbard and Turban can fairly be ranked as the two best varieties for table use, and hundreds of letters received this season speak of them as "the sweetest, dryest and best flavored squashes known." Both kinds can be kept through the winter. As the original introducer of these two squashes, I send packages of the purest seed in the market to any address, at 15 cents each.—One package, Hubbard, 35; Turban, 35.—Pound packets, Hubbard, \$2.00; Turban, \$2.50.—All warranted to reach the purchaser. If any person, after trying these, does not find them to be what I represent, I will refund his money.
JAMES J. H. GREGORY,
Marblehead, Mass.

The Orange Jolly or Golden Ball, German Teltow, Skirving's Ruta Baga and White French or Hanover, are best for main crop. Pre-paid by mail, for \$1 per lb., 10 cts. per oz. The New White Sweet German is the finest of all winter turnips, command the best price and keep till May. \$2 per lb., 25 cts. per oz. B. M. WATSON, Seed Establishment, Plymouth, Mass. Catalogue and Trade List to any address.

Just Published.

A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By Doct. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, he it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly by Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

SENT POST-PAID, PRICE \$3.00.

ORANGE JUDD & CO., 41 Park Row.

The Miniature Fruit Garden,

OR THE CULTURE OF
Pyramidal and Bush Fruit Trees.

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

SENT POST-PAID. - - - PRICE, \$1.00
ORANGE JUDD & CO., 41 Park Row.My Vineyard at Lakeview;
Or, Successful Grape Culture.

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

SENT POST-PAID. - - - PRICE \$1.50.

ORANGE JUDD & CO., 41 Park Row.

BY

Cummings & Miller.

Carpenters, Builders, and Stone Cutters;

Your attention is invited to a NEW and PRACTICAL WORK ON ARCHITECTURE, giving in detail on a working drawing scale, the exterior and interior of various classes of buildings—with 382 designs and 714 illustrations, containing street fronts, suburban houses, cottages, cut stone work, &c., &c. ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, described in April number of the *American Agriculturist*, page 147, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale.

They are retailed at *Three Dollars* per set, of one hundred and thirty pieces, put up in a neat box, and accompanied with a card giving various designs of buildings. A liberal discount will be made to dealers. Address

THE AMERICAN
AGRICULTURAL ANNUAL for 1867.

A New Year-Book,

CONTAINING

AN ALMANAC,

Hints About Work for Each Month,

Recent Progress in Agriculture, and

A Review of the Past Year, together with numerous very valuable contributed articles, and convenient Tables.

The **Essay on Draining**, by Col. Waring, Engineer of the Drainage of the N. Y. Central Park, is by far the most complete presentation of the subject which has been made for many years in this country.

Some of the Newest and Best Potatoes, with his own mode of culture, are described by one of the most successful cultivators of Westchester County, N. Y., Wm. S. Carpenter.

The Culture of Sorghum, with the latest views in regard to the production of Syrup and Sugar, is discussed by Wm. Clough, Esq., Editor of the Sorgho Journal.

How to Train the Horse.—Mr. Headley's Hints on Training and his Views in regard to his Mind and Temper deserve the attention of every horse owner.

The Culture of Wheat, is discussed practically and philosophically, by Mr. Harris.

John Johnston's Practice in Fattening Sheep, like every thing from his ripe experience, is very valuable.

Essential Features of a Good Barn.—Dr. F. M. Hexamer consults durability in the structure and economy in farm labor, security of crops, health and comfort of stock, in this admirable plan.

The above are but a few of the articles comprised in this little volume—and which make it not only

A Record of Past Progress and Experience—but

A Hand-Book for the Present—and

A Guide for the Future.

This volume is the first of a series which we expect to issue annually, intending to make them a record of what happens each year best worth knowing and remembering, pertaining to Agriculture, in a convenient form for preservation and reference.

Price, fancy paper covers, 50 cts.; cloth, 75 cents.
Sent Post-paid.

ORANGE JUDD & CO., 41 Park Row.

THE AMERICAN
HORTICULTURAL ANNUAL for 1867,

**A Year-Book for the Gardener, The
Fruit Grower and the Amateur.**

NOW READY.

This is the first of a series of Annuals intended to give a record of Horticultural progress.

IT CONTAINS

An Almanac and Calendar for each Month, giving Hints for Work in the various departments.

Useful Tables, giving amount of Seed to sow a given space; number of Seeds to the ounce, etc.

How Horseradish is Grown for Market, by Peter Henderson. An article worth the price of the work to the grower for market.

Growing Grape Vines from Cuttings without Artificial Heat, by a simple process.

Home Decorations, IVY, HANGING BASKETS, etc. Instructions for the making, planting and management of these beautiful ornaments by A. Bridgeman.

The New Apples of 1866.—The new varieties first brought to notice the past year; as also Southern kinds first fruited at the North, by Doct. J. A. Warder.

New or Noteworthy Pears.—A valuable article, by P. Barry.

Native Grapes in 1866, from Notes furnished by Charles Downing, Geo. W. Campbell, J. A. Warder, A. S. Fuller, and other grape growers.

Small Fruits in 1866.—Accounts of new varieties and older ones not yet fully tested. By A. S. Fuller.

The Newer Garden Vegetables.—The result of experiments with new culinary plants, by Fearing Burr, Jr., J. J. H. Gregory, and others.

The Rarer Evergreens that have proved Valuable.—By Thomas Meehan.

The New Roses in 1866.—Brief descriptions of the novelties, by John Saul.

New Bedding and other Plants of 1866.—An account of how the recent importations have done the past year, by Peter Henderson.

The New Varieties of Gladiolus.—All the new ones noticed, by George Such.

Engravings of Fruits, Flowers, etc.—A useful list of those published in 1866.

Horticultural Books and Periodicals in 1866.—A list giving title, publishers name and price.

Nurserymen, Seedsmen and Florists.—A list of the most prominent Establishments.

With many other articles not here enumerated.

Fully Illustrated,

with Engravings made especially for the work.

A neat volume of 150 pages. Price, fancy paper covers, 50 cents; cloth, 75 cents. Sent Post-paid.

NEW YORK:

ORANGE JUDD & CO., 41 Park Row.

A NEW WORK.
GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

In the last chapter, the most valuable kinds are described, and the culture proper to each is given in detail.

NOW READY. 12 mo., 244 pp. *Finely Illustrated.*
SENT POST-PAID. PRICE, \$1.50.

NEW BOOKS.

**Saunders' Domestic Poultry.**

By S. M. SAUNDERS.

New Edition Revised and Enlarged.

This Book contains Articles on the Preferable Breeds of Farm-Yard Poultry, Their History and Leading Characteristics, with Complete Instructions for Breeding and Fattening, and Preparing for Exhibition at Poultry Shows, etc., etc., derived from the Author's Experience and Observation.

The work is compact, full of valuable hints and information, and beautifully illustrated.

An appendix contains an account of *Poultry breeding on a large scale*, as practiced in the neighborhood of Paris, and is a very important addition to the work.

Price, paper 40 cts., cloth 75 cts.

ORANGE JUDD & CO., 41 Park Row.**Money in the Swamps.****PEAT! PEAT! PEAT!****FUEL—MANURE.****WHERE TO FIND IT.****HOW TO MAKE AND USE IT.****ITS VALUE.****A NEW WORK ON PEAT,****THOROUGH AND PRACTICAL;**

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of **PEAT, MUCK, etc.**, telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc., and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

SENT POST-PAID, - - - PRICE \$1.25

ORANGE JUDD & CO.,**41 PARK ROW, NEW-YORK.****New Book of Flowers.**

By JOSEPH BRECK, Practical Horticulturist.

Beautifully Illustrated.

This work, while preserving scientific accuracy, is written in a familiar style, and with the enthusiasm of a life-long lover of flowers. Its teachings are eminently practical, and cover all branches of out of door gardening.

Bulbs.

The cultivation of bulbs, whether in-doors or in the open ground, is clearly described, and such instructions are given as will insure success with these favorite plants.

Annuals.

All the finer annuals are described, and the peculiar treatment necessary for each given in full.

Herbaceous Perennials.

This justly favorite class of plants is given here more at length than in any work with which we are acquainted.

Bedding Plants.

The treatment of the popular kinds of bedding plants is given, together with that of Dahlias, Chrysanthemums and such as usually fall under the head of florist's flowers.

Flowering Shrubs.

A separate section is devoted to the hardy flowering shrubs, including a very full chapter upon the

Rose.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. Not the least interesting part of the work is the author's personal experience, as he tells not only how he succeeded, but the mistakes he committed. Thus far it is

"The Book of Flowers."

SENT POST-PAID.

PRICE, \$1.75.

Sent Post-paid.

Price \$1.50.

Gratifying Opinions of the Press.

From the Christian Intelligencer.

"Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From Moore's Rural New Yorker.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the Vermont Farmer.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the N. Y. Christian Advocate.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

SENT POST-PAID.

PRICE \$1.50.
